v. 36

Index for Vol. XXXVI of Gleanings in Bee Culture.

In using this index the reader should not fail to note that it is divided into five departments, namely, General Correspondence, Editorials, A. I. Root's writings, Contributors, and Illustrations. The whole index has been prepared with great care. Sometimes two and even three catch-headings will be found, referring to the same general subject. The purpose of this cross-indexing is to facilitate reference. If the reader does not find the subject he desires under one head, let him think of some other catch-heading and try that, and so on. If not found in the General Correspondence try Editorials or Illustrations. Subjects are never indexed under the words *A, An, The, How*, etc. Always look for some important catch-word that comprehends the thought or discussion.

Editorials are indexed separately, as they relate to prices, current items, announcements, and the general scope of current discussion.

The index of Illustrations will be found especially valuable from the fact that most of the important articles have cuts. By looking for the cut under this index one will be able to locate the subject he seeks.

Owing to the fact that our index for this year is very complete we have been compelled to run the headings in. While this is not quite as handy as the line-for-line scheme, we are compelled to adopt it on account of a lack of room.

GENERAL CORRESPONDENCE

Adulteration 627, 1369, 1429; Advertising honey 149, 813; After-swarm before prime swarm 681; After-swarms issuing before prime swarms 17; Alarm for filling cans 761, 811; Alaska, honey candied in 1267; Alexander feeder, enlarging 234; Alexander plan for weak colonies 214, 366; Alexander, last days of 1504; Alexander, obituary of 1256; Alfalfa in Nebraska 435; Alfalfa for horses 1310; Alfalfa honey liquefied in hot air 581; Alfalfa in Colorado 635; Alfalfa hay, curing 885; Alfalfa, bloom of 1387; Alfalfa, irrigated, honey from 1505; Alfalfa, large area of 1124; Alfalfa, time to cut 632; Alfalfa, curing of 937; Algerian Bee Journal resumed 876; Alley trap v. clipped queens 282; Alley, Henry, sketch of 352; Alsike clover in Michigan 1185; Alsike and timothy 894; Alsike around Marengo 1363; Alsike clover hay 874; Alsike clover for farming 937; American methods in Europe 876; Ants in comb honey 1139; Ants in Texas 635; Ants, Argentine 1432; Ants, natural history of 803; Ants, to destroy 1328; Ants, to keep out of honey-houses 1444; Apiary, cart-wheel arrangement of 627; Apiary, location of 1430; Apiary, new arrangement of hives in 150; Apiary, unnecessary work in 1120; Apiculture in agricultural colleges 553; Aroma of honey, to retain 1263; Artificial honey 277, 747; Asphalt paper for hive-bottoms 335; Aspinwall hives severely tested 932; Aspinwall slatted frames not adapted to L. hive 757; Aspinwall, visit to 1066; Aster honey poor winter stores 1313; Aster honey kills bees 1185; Aster, red pollen from 102; Australia, bee-keeping in 233, 998, 1061; Australia, greetings from 1513; Australia, new bee-journal in 1369; Australia, west, trees of 27; Automobiles for bee-keepers 342.

Bait combs without separators 1373; Bait combs in supers 934; Bait sections finished first 987; Bait sections from previous year 996; Basswood suddenly checked 1491; Basswood buds in June 200; Basswood as a honey-yielder 23; Basswood in Michigan 1185; Basswood leaves, injury to 580; Basswoods injured by moths 1000; Basswood, germinating seed of 233; Basswood, reliability of 493; Basswood, short flow at Marengo 927; Beeswax in the arts 632; Bee-escape, see escape; Bee history, new work on 426; Bee moth 571; Bees as fertilizers of blossoms 144; Bees dying in spring 703, 1010; Bees dying mysteriously 233; Bees returning to old location in spring 77; Bees valuable to farmers 993; Bees, age of when starting to work 411, 1116; Bees,

shaking 491; Bees, black, in Europe 38; Bees, improvement of 77, 433; Bees, irritable 342; Bees, length of flight 806; Bees, load of 1047; Bees, life of 336; Bees, position of in winter 78; Bees, three races crossed 38; Bees, old, killed 1267; Bees, strength of 1427; Bees, vicious, to manage 871; Bee-cellar, see cellar; Bee-experiment station 17; Bee-house, portable 885; Bee-keeper, growth of 1133; Bee-keepers, prosperous, keep more bees 545; Bee-keepers, back-lot 1319; Bee-keeping, fascinating, beginner's experience 1510; Bee-keeping, when it pays 1263; Bee-keeping in Switzerland 38; Bee-keeping an old occupation 1303; Bee-tree cut in winter 637; Bee-tree, trouble over 1248; Bee-veils, different kinds 93; Beet v. cane sugar 1121, 1175, 1249; Beet sugar, bluing in 1309; Beginner's experience 1510; Belgium bee-keepers' society 28; Belgium, price of honey in 1370; Bertrand, Edward 750; Beuhne, interview with 998, 1061; Bisulphide of carbon, see carbon-bisulphide; Black bees not liked 552; Black bees, inferiority of 932; Blacks v. Italians 1308; Block and pulley for lifting cans 365; Boats, bees moved on 1257; Bottling, Coveyou on 1064; Bottling honey in New England 493; Bottling honey 365; Bottom-bars, combs built solid to 1383; Bottom-bars, double 1136; Bottom-bars, how spaced 335; Bottom-bars, space between 199, 276, 343, 411, 629, 682, 872, 927; Bottom-bars, space under 17, 47, 485, 1047, 1266, 1303, 1368, 1423, 1424, 1488; Bottom-bars, thickness of 799; Bottom-board, vestibule 1137; Bottom starters, see starters; Bottoms, thin, a nuisance 1446; Brazil, bee-keeping in 1186, 1434; Breeding better stock 336; Breeding for improvement 433; Breeding of bees, Bender on 433, 874; Breeding of domestic animals 889; Breeding queens 569; Breeding-queens, selection of 24; British Guiana, bee-keeping in 428, 1182; British Isles, bee-keeping in 1383; Brood and honey in same cell 993; Brood above honey 372; brood in January 343; Brood dies because of weak queen 1511; Brood in supers prevented by excluder 641; Brood put in queen-cells 987; Brood, dead, during honey-flow 950; Brood, equalizing in spring 419, 486; Brood, Hershiser plan for equalizing 420; Brood-cells, queen, better than storage cells 1368; Brood-combs, full, importance of 874; Brood-combs, too much honey in 416; Brood-chamber contracted for winter 286; Brood-nest contracted by dummies in middle 746; Brood-nest, honey in

281, 1056; Brood-nest, temperature of 83; Brood-nest, to get honey out of 1200; Brood-rearing in spring 411; Brood-rearing stimulated by stores 872, 873, 927; Brood-rearing stopped while eggs are still laid 1363; Buckwheat of foundation 151, 631, 1440; Buckwheat in Texas 629; Buckwheat in poor season 2054; Buckwheat honey 140; Buckwheat, decrease in amount 1053; Buckwheat, opinion of farmers 642; Buckwheat, Silverhull, preferred 1504; Building up colonies for harvest 362, 421, 639; Building, removing bees from 701; Bulk comb honey, good price for 1011; Bulk comb honey in Texas 207; Bulk comb honey, liquefying 370; Bulk comb honey profitable in the south 1250; Bumble-bees in Arctic regions 799; Burbank, Dadant's visit to 1364; Burr-combs between two supers 987.

Cans, should dealers pay for? 1491; Cage, Miller improved 147; Cages, demonstration, see handling live bees; California bee-keeping 1505; California, Imperial Valley of 1052, 1055, 1125; California weather conditions 803; California sage, enemies of 1202; California, university of 1322; California, yield in 1054; Cane sugar, variation of in honey 1121; Can-filler, Coveyou automatic 101, 811; Canada, honey-flow in 932; Canada, prospects for season 876; Canadian association 818; Canadian northwest, honey-plants in 763; Canded honey in hives 1079; Canded comb honey 1140; Canded honey in combs 621, 1487; Candying, to prevent, 465; Cane sugar in honey 139; Canded honey, dry 1243; Canded honey, exhibiting 207; Canded honey, retaining aroma of 1263; Candying of honey as soon as capped 1444; Candles, why beeswax is used for 687; Canning fruit with honey 809; Cans, plea for better 1493; Cappings of dark wax 1368; Cappings, white, to breed for 434; Cappings, watery 832; Cappings, white, in Caucasian colonies 690; Cappings, watery, made by best workers 702; Capping-melter, Mercer 217; Capping-melter, latest design 1375; Capping-melter, crane on 342; Capping-melters, old 828; Capping-melter, Peterson's 559; Capping-melter, Lathrop on 1380; Carbon bisulphide for fumigating 830, 935, 1207; Carniolan-Italian bees 739; Carpet weeds 1371; Cartons for comb honey 702, 1071; Caucasians not good honey-gatherers 42; Caucasians at Nebraska fair 1248; Caucasians breed many drones 1063; Caucasians build much drone comb 1133; Caucasians excel Italians 690; Caucasians, irritable 102; Caucasians, Wilder's experience with 1424; Cellar, bees quiet in 1492; Cellar of concrete 1316; Cellar, feeding in 17; Cellar for storing honey 739; Cellar too cold 1078; Cellar ventilation 208, 275, 360, 1186, 1316; Cellar, carbon-dioxide in 26; Cellar, damp 214; Cellar, locating hives when removing bees from 492; Cellar, bee-room partitioned off in 1185; Cellar, covers removed in 1126; Cellar, removing bees from 345, 360, 418, 701; Cellar, screened entrances in 582; Cellar, when to put bees in 25, 1492; Cellars v. outdoor plan 372; Cellars, foundation of 208; Cellars, hive-covers loose in 345; Cellars, ventilation of 275, 360, 1186, 1316; Cells, grafting 39; Chickens eat drones 584; China, bees in 1512; Chittim tree 832; Cleaning comb honey 832, 1057, 1073; Clipping queens, 371, 700; Clipped queens v. queen-trap, see queen-trap; Clover, does drouth kill? 1487, 1512; Clover, honey from second crop 952; Clover, white Italian 40; Clover, sweet, and alfalfa, in Alabama 893; Clovers in France 750; Clovers, sour 86; Cluster, position of in winter 446; Clusters quiet in cellar 1492; Clustering out not waste of time 944, 1368; Clustering out on hot days 987; Cogshall, methods of 1499; Colorado grading-rules 546; Colorado, bee-keeping 1128; Colorado, season in 1312; Colonies building up in spring 362, 421, 639; Colonies reaching maturity in time for honey-flow 419; Colonies rendered normal 364; Colonies, weak, Alexander plan modified 366; Colonies, why they differ 1205; Colonies, equalizing in spring 347, 362; Color of hives 551; Colors distinguished by bees 1124; Color, do bees notice? 1447; Color, how bees distinguish 145; Comb and extracted honey in same super 631; Comb v. extracted honey 341, 681, 867, 1446; Comb

honey sold by section 946; Comb honey twelve years old 1437, 1487; Comb honey without separators 947; Comb honey hauled in wagons, see hauling, etc.; Comb honey season, close of 995; Comb honey supers, extracting combs in 100; Comb honey, cleaning 832, 1057, 1073; Comb honey, crowding, to secure perfect capping 1431; Comb honey, fancy, from foul-broody colonies 495; Comb honey, labeling weight of 199; Comb honey, melting 343; Comb honey, moths in 1199; Comb honey, off-grade, to sell 102; Comb honey, preparing for market 1073; Comb honey, price of in Canada 552; Comb honey, transparent wrappers for 39, 102, 369; Comb honey, wax in, unwholesome 199; Combs melting in hive 681; Combs of sealed honey fed in spring 83; Combs, melting in supers 485; Combs, perfect, without wire or splints 699; Combs, thin, even-er than thick 342; Comb-builders 341; Comb-building, peculiarities in 34; Congress of beekeepers in London 876; Convention, Brant district 25, 285; Convention, Colorado state 1430; Convention, Massachusetts 294; Convention, national, at Detroit 1181; Co-operative experiments 100; Correspondence school in France 750; Cotton honey light-colored 1250; Covers of Tin cause swarming 933; Covers, filling cracks in 41; Covers, leaky, kill bees 1446; Covers, sealed, preferred 1327; Cross bees, to manage 871; Cross bees, finding queen among 927; Crosses of different races 877; Crossing bees 38; Cuba, moving three apiaries in 1441; Cushions v. sealed covers 1327.

Quebec bee-keepers 154; Queens, two wintered in one hive 582; Queen-excluder as used in England 1386; Queen-rearing, Fluhrhart on 1007.

Raspberry pasturage in Michigan 564, 565; Rauchfuss, Frank and family 32; Robinson, T. P. 215.

Separators, Atwater's method of cleaning 878; Shade and no shade 1315; Shade of honeysuckle arbor 1130, 1131; Shade-boards, clustering out in spite of 944; Shed apiary 90, 288; Shed apiary in Maine 637; Shed for winter Britton's 1438; Shed for winter packing 446; Shipping-case, sliding-cover 1060; Shoe, Coward 1514; Smile that won't come off 1201; Smoker-valve, to renew 371; Splints gnawed by bees 1127; Split sections 631; Step-ladder, handy 437; Storm-door 96, 97, 354, 1080, 1387; Strainer, cheese-cloth, Hutchinson on 812; Strainer supported by heavy wire cloth 1208; Strainer, Townsend's 761; Sun palace for national convention 755; Super, England 1384; Swarm, Davidson's 1317; Swarm, to hive 814-816; Swarm-catching cage 1261; Swarm-catcher of burlap sack 764; Swarm-catcher, Dayton's 1509; Sweet clover, cattle feeding on 220; Sweet clover on Chicago drainage canal 940, 941; Swiss bee station 427; Swiss bee-keeping 879, 880-884.

Tent for chickens 1508; Transferring bees from box hives 497-499; Transferring, Wilder's method 1321; Travel-stain, Crane's honey-board to prevent 1507, 1508; Tyler, M. D., of Seville 1070.

Uncapping-box, McIntyre, Townsend on 760; Uncapping-can made of cracker-barrel 751; Uncapping-knife heater 751.

Veils, various styles of 93, 94; Virgins in nursery-cage 1318; Von Buettel-Reepen in garden 222.

Wagon for selling honey 1071; Wagon, honey and vegetable 1129; Wagon, removable tray for 1377, 1378; Watering-device for chicks 1074; Wax-press, Sibbald's 211; Wax-separator, Aikin's 1314; Windmill, Robinson's 216; Winter case and vestibuled entrance 97; Winter cases of boxes 697; Winter cases of tar paper 151; Winter cases of paper 151, 1265; Williams, Susan E. 88; Wiring frames 758.

Books for Bee-keepers and Others.

Any of these books on which postage is not given will be forwarded by mail postpaid, on receipt of price.

As many of the bee-books are sent with other goods by freight or express, incurring no postage, we give prices separately. You will notice that you can judge of the size of the books very well by the amount required for postage on each.

BIBLES, HYMN-BOOKS, AND OTHER GOOD BOOKS.

Postage.] [Price without postage

- 8 | Bible, good print, neatly bound 20
10 | Bunyan's Pilgrim's Progress** 40

1 | Gospel Hymns, consolidated, Nos. 1, 2, 3, and 4, words only; cloth..... 10

2 | Same, board covers 20

3 | New Testament in pretty flexible covers..... 05

One-half off on all Gospel Hymns mentioned above.

5 | New Testament, new version, paper covers..... 10

10 | New Testament, both Spanish and English.... 25

In this book the Spanish is given in one column, and the English right opposite in another column. Every verse is opposite the corresponding one in the column adjoining, so that it affords the reader the very readiest means of comparing the language of the two. The writer has found this book to be a great help in the learning of Spanish, and he has also received spiritual benefit by getting a glimpse of the word of God in another language. The book is published by the American Bible Society, and we hope and trust it may have a good sale.

6 | Christian's Secret of a Happy Life. Cloth..... 25

For several years we have been unable to get a nice substantial copy of this book at a reasonable price. We are glad to tell our friends now, however, that we have a very pretty edition, bound in cloth, at the very reasonable price of 25 cents. If wanted by mail, add 6 cents for postage. This book has had a very large sale for more than 20 years, and when I tell you that quite a number of people have been converted to the Lord Jesus Christ simply by reading it you will no longer wonder why it sells. At one time it was carried and sold by the newsboys on our railways. It not only contains a wonderful "secret" for unbelievers, but for many who have been church-members all their lives, but not the "happy" church-members that God intended we should be.

BOOKS ESPECIALLY FOR BEE-KEEPERS.

MISCELLANEOUS HAND-BOOKS.

Postage.] [Price without postage.

5 | A B C of Carp Culture, by Geo. Finley..... 25

5 | A B C of Strawberry Culture,** by T. B. Terry.. New edition, revised and enlarged; paper, 45c; cloth, 68c; by mail, 75c.

5 | A B C of Potato Culture, Terry** New edition, revised & enlarged; paper, 45c; cloth, 68c. mail work.

6 | Asparagus Culture 40

8 | Alfalfa Culture..... 40

8 | Barn Plans and Out-buildings..... 90

2 | Celery for Profit, by T. Greiner**..... 25

The first really full and complete book on celery culture, at a moderate price, that we have had. It is full of pictures, and the whole thing is made so plain that a schoolboy ought to be able to grow paying crops at once without any assistance except from the book.

10 | Draining for Profit and Health, Warring..... 90

8 | Domestic Economy, by I. H. Mayer, M. D.**... 30

This book ought to save at least the money it costs, each year, in every household. It was written by a doctor, and one who has made the matter of domestic economy a life study. The regular price of the book is \$1.00, but by taking a large lot of them we are enabled to make the price only 30 cents.

10 | Fruit Harvesting, Storing, Marketing, etc..... 75

It has been well said that it is an easier matter to grow stuff than to sell it at a proper price after it is grown; and many men fail, not because they are inexperienced in getting a crop, but because they do not know how to sell their crops to the best advantage. This is the first book of the kind we have had as an aid in selling. It not only tells all about picking, sorting, and packing, but gives all the best methods for storing for one or two days or a longer time. It also tells about evaporating and canning when there is a glut in the market. It discusses fruit packages and commission dealers, and even takes in cold storage. It is a new book of 250 pages, full of illustrations. Publisher's price, \$1.00.

7 | Farming with Green Manures, postpaid**..... 90

This book was written several years ago; but since competent labor has got to be so expensive, and hard to get, many farmers are beginning to find they can turn under various green crops cheaper than to buy stable manure, and haul and spread it—cheaper, in fact, than they can buy fertilizers. This book mentions almost all plants used for plowing under, and gives the value compared with stable manure. Some of the claims seem extravagant, but we are at present getting good crops, and keeping up the fertility, by a similar treatment, on our ten-acre farm.

7 | Farm, Gardening, and Seed-growing**..... 90

10 | Fuller's Grape Culturist**.....1 15

5 | Garden and Farm Topics, Henderson**..... 0

12 | Gardening for Pleasure, Henderson**.....1 10

While "Gardening for Profit" is written with a view of making gardening pay, it touches a good deal on the pleasure part, and "Gardening for Pleasure" takes up this matter of beautifying your homes and improving your grounds, without the special point in view of making money out of it. I think most of you will need this if you get "Gardening for Profit." This work has 246 pages and 134 illustrations. (Retail price \$2.00.)

12 | Gardening for Profit**.....1 10

This is a late revision of Peter Henderson's celebrated work. Nothing that has ever before been put in print has done so much toward making market-gardening a science and a fascinating industry. Peter Henderson stands at the head, without question, although we have many other books on these rural employments. If you can get but one book let it be the above. It has 376 pages and 138 cuts. (Retail price \$2.00.)

8 | Gardening for Young and Old, Harris**..... 90

This is Joseph Harris' best and happiest effort. Although it goes over the same ground occupied by Peter Henderson, it particularly emphasizes thorough cultivation of the soil in preparing your ground; and this matter of adapting it to young people as well as old is brought out in a most happy vein. If your children have any sort of fancy for gardening it will pay you to make them a present of this book. It has 187 pages and 46 engravings.

3 | Grasses and Clovers, with Notes on Forage Plants..... 20

This is by Henry A. Dreer, author of the book "Vegetables Under Glass" that has had such a large sale of late. This little book tells how six tons of grass has been grown to the acre, and gives much other valuable matter.

Postage.]

[Price without postage.

10 | Greenhouse Construction, by Prof. Taft** 1 15
This book is of recent publication, and is as full and complete in regard to the building of all glass structures as is the next book in regard to their management. Any one who builds even a small structure for plant-growing under glass will save the value of the book by reading it carefully.

12 | Greenhouse Management, by Prof. Taft**..... 1 15
This book is a companion to Greenhouse Construction. It is clear up to the times, contains 400 pages and a great lot of beautiful half-tone engravings. A large part of it is devoted to growing vegetables under glass, especially Grand Rapids lettuce, as well as fruits and flowers. The publisher's price is \$1.50; but as we bought quite a lot of them we can make a special price as above.

5 | Gregory on Cabbages, paper* 20

5 | Gregory on Squashes, paper*..... 20

5 | Gregory on Onions, paper*..... 20

The above three books, by our friend Gregory, are all valuable. The book on squashes especially is good reading for almost anybody, whether they raise squashes or not. It strikes at the very foundation of success in almost any kind of business.

| Handbook for Lumbermen..... 05

5 | Home Pork-making; 125 pages, illustrated..... 40

I think it will pay well for everybody who keeps a pig to have this book. It tells all about the care of the pig, with lots of pictures describing cheap pens, appliances, all about butchering, the latest and most approved short cuts; all about making the pickle, barreling the meat, fixing a smoke-house (from the cheapest barrel up to the most approved arrangement); all about pig-troughs; how to keep them clean with little labor; recipes for cooking pork in every imaginable way, etc. Publisher's price is 50 cents, ours as above.

15 | How to Make the Garden Pay**..... 1 35
By T. Greiner. Those who are interested in hot-beds, cold-frames, cold green-houses, hothouses, or glass structures of any kind for the growth of plants, can not afford to be without the book. Publisher's price \$2.00.

| How we Made the Old Farm Pay—A Fruit-book, Green 10

10 | Irrigation for the Farm, Garden, and Orchard* 85
By Stewart. This book, so far as I am informed, is almost the only work on this matter that is attracting so much interest, especially recently. Using water from springs, brooks, or windmills to take the place of rain, during our great drouths, is the great problem before us at the present day. The book has 274 pages and 142 cuts.

3 | Maple Sugar and the Sugar-bush**..... 25

5 | Manures; How to Make and How to Use Them; in paper covers..... 30

6 | The same in cloth covers..... 65

| Nut Culturist, postpaid..... 1 25

3 | Onions for Profit**..... 40

Fully up to the times, and includes both the old onion culture and the new method. The book is fully illustrated, and written with all the enthusiasm and even if one is not particularly interested in the business, almost any person who picks up Greiner's books will like to read them through.

10 | Our Farming, by T. B. Terry**..... 75

| Same, paper cover, postpaid..... 50

In which he tells "how we have made a run-down farm bring both profit and pleasure."

If ordered by express or freight with other goods, 10c less.

8 | Practical Floriculture, Henderson.* 1 10

10 | Profits in Poultry.* 1 00

10 | Small-Fruit Culturist, Fuller 75

2 | Experiments in Farming. By Waldo F. Brown. 08

This little book ought to be worth its cost for what is said on each of the four different subjects; and the chapter on cement floors may be worth many dollars to anybody who has to use cement for floors, walks, or any thing else. In fact, if you follow the exceedingly plain directions you may save several dollars on one single job; and not only that, get a better cement floor than the average mason will make.

2 | Sweet Potatoes: Forty Years' Experience with.

By Waldo F. Brown *. 08

This little book, by a veteran teacher at our farm

Postage.]

[Price without postage.

ers' institutes, ought to be worth many times the price to everybody who grows even a few sweet potatoes in the garden. It also gives full particulars in regard to handling and keeping this potato, which is difficult to keep unless you know just how.

10 | Talks on Manures* 1 35

By Joseph Harris. Written conversational style, which makes it very interesting reading. It covers the subject very completely; contains numerous analyses of manures and comparative tables. The use of technical language is avoided, which makes the book of greatest value to the practical farmer. A book of 366 pages, nicely bound in cloth.

5 | The New Rhubarb Culture**..... 40

Whenever apples are worth a dollar a bushel or more, winter-grown rhubarb should pay big. It does not require an expensive house nor costly appliances. Any sort of cellar where it will not freeze is all right for it; and the small amount of heat necessary to force the rhubarb costs very little. The book is nicely bound in cloth, full of illustrations, mostly photos from real work, 130 pages. Every market-gardener should have this book, for the lessons taught indirectly, in regard to forcing other crops besides rhubarb. Publisher's price 50c.

5 | Tile Drainage, by W. I. Chamberlain 35

Fully illustrated, containing every thing of importance clear up to the present date.

The single chapter on digging ditches, with the illustrations given by Prof. Chamberlain, should alone make the book worth what it costs, to every one who has occasion to lay ten rods or more of tile. There is as much science in digging as in doing almost any thing else; and by following the plan directed in the book, one man will often do as much as two men without this knowledge.

5 | Tomato Culture 35

In three parts. Part first.—By J. W. Day, of Crystal Springs, Miss., treats of tomato culture in the South, with some remarks by A. I. Root, adapting it to the North. Part second.—By D. Cummins, of Conneaut, O., treats of tomato culture especially for canning-factories. Part third.—By A. I. Root, treats of plant-growing for market, and high-pressure gardening in general.

3 | Vegetables under Glass, by H. A. Dreer**..... 20

3 | Vegetables in the Open Air*..... 20

This is a sort of companion book to the one above. Both books are most fully illustrated, and are exceedingly valuable, especially at the very low price at which they are sold. The author, H. A. Dreer, has a greenhouse of his own that covers one solid acre, and he is pretty well conversant with all the arrangements and plans for protecting stuff from the weather, and afterward handling to the best advantage when the weather will permit out of doors.

3 | Winter Care of Horses and Cattle..... 25

This is friend Terry's second book in regard to farm matters; but it is so intimately connected with his potato-book that it reads almost like a sequel to it. If you have only a horse or a cow, I think it will pay you to invest in a book. It has 44 pages and 4 cuts.

3 | Wood's Common Objects for the Microscope**.. 47

8 | What to Do, and How to be Happy while Doing It..... 65

The above book, by A. I. Root, is a compilation of papers published in *Gleanings in Bee Culture*, in 1886, '7, and '8. It is intended to solve the problem of finding occupation for those scattered over our land out of employment. The suggestions are principally about finding employment about your own homes. The book is mainly upon market-gardening, fruit-culture, poultry-raising, etc. Illustrated, 188 pages, cloth

8 | Same, paper covers..... 40

**HAVE
YOUR
HIDES**

**MADE INTO FURS FOR
THE WHOLE FAMILY**

Don't sell your hides—it's poor economy. Send them to us and have them made into Fur Coats, Robes, Mittens, etc., and keep your whole family warm this winter. Any color horse or cow hide looks well. Our process makes them soft and pliable, as well as moth-proof and water-proof.

No matter where you live we will pay the freight on all Hides sent to us to be made into Coats and Robes.

We guarantee complete satisfaction with all our work. Don't send your hides to inexperienced tanners and be disappointed. We are the largest firm in the country that tans, manufactures and sells direct to the consumer. We are equipped in all departments to do first-class work. We'll make you a robe from your hide, lined with best plush, for from \$7.00 up; a coat made to your measure, lined and trimmed in splendid style, for from \$9.50 up. With every coat or robe we make we furnish free a fine pair of Fur Mittens, with horse-hide palms. One large hide or two small ones makes a coat like one shown here. We also make long or short coats for ladies and for girls and boys. Calf, goat, dog and colt skins make elegant Floor Rugs, and Gauntlet Gloves and Mittens. We tan any kind of skins, wild or domestic, and make them into furs to order. Our prices are reasonable, while the quality of our work is of the highest order. Write us before you sell a single hide; ask for our 40-page catalog giving full particulars and showing our full line of fur goods. Write today.

National Fur and Tanning Co.,
219 Hooker Ave., Three Rivers, Mich.

We wish you a Happy New Year. Using Root Quality Goods will help to make it so. We sell them in Michigan. The discount for January is three and one-half per cent. No trouble to tell you exact prices.

GLEANINGS one year (new or renewal) and a bee-veil with silk-tulle front for \$1.10. Take advantage of this combination offer.

Honey Markets.

GRADING RULES FOR COMB HONEY.

FANCY.—All sections well filled, combs straight, firmly attached to all four sides, the combs unsolled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface solled, or the entire surface slightly solled; the outside surface of the wood well scraped of propolis.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct, to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent) cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

ZANESVILLE.—As is usual at the holiday season, the demand for honey is very slack. There is plenty of fancy white alfalfa comb on this market, which brings 18 to 19, wholesale; practically nothing else offered, save a little dark-looking fall honey brought in by farmers. There is almost no demand for extracted except in glass retail packages. The local financial condition is not far from normal, and this would indicate an increased demand for honey early in the new year. Beeswax quiet, and supply slightly in excess of demand. For good yellow wax would pay 30 f, o. b. here in exchange for bee supplies.

EDMUND W. PEIRCE,

Dec. 19. 136 West Main St., Zanesville, O.

KANSAS CITY.—The demand for both comb and extracted continues slow; receipts fair, but don't look for much improvement until after the holidays. We quote No. 1 white comb, 24-section, \$3.25; No. 2, white and amber, \$2.75 to \$3.00; extracted white, 8 to 8½; extracted amber, 7 to 7½. Beeswax, 25 to 27.

C. C. CLEMONS & Co.,
Kansas City, Mo.

Dec. 21.

SCHENECTADY.—As usual during the holiday season, honey market dull and but very little demand. Present prices would have to be shaded to induce sale. Prices later on will depend on the financial situation to a great extent, and the number of unemployed honey-consumers.

C. MACCULLOCH,
Schenectady, N. Y.

Dec. 18.

INDIANAPOLIS.—Demand for comb honey seems to be limited, and very little is now being offered by producers. Evidently those who disposed of their crop early were most fortunate. Jobbers are offering 15 and 16, delivered. Extracted honey is in better demand, especially best grades, and jobbers are paying 9 cents, delivered. Beeswax is in fair demand, and brings 28 cents cash, or 30 in exchange for merchandise.

WALTER S. POUDEH,
Indianapolis, Ind.

Dec. 17.

ST. LOUIS.—Since our last, of Dec. 9th, there is no change in our honey market. The receipts, however, have been very small, and this market is almost bare of extracted honey. There is enough comb honey here to meet the small demand. We quote fancy comb honey, white, 16 to 17; No. 1, 15 to 16; amber color, 14 to 16, according to quality and condition. Broken and defective honey cells at considerably less. Extracted white, in cans, nominal at 8½ to 9; amber, in cans, 8 to 8½; in barrels and half-barrels, ½ to 1 per lb. less. Beeswax, 26 for choice pure. All impure and inferior, lower.

R. HARTMAN PRODUCE CO.,
St. Louis, Mo.

Dec. 19.

CHICAGO.—The market is quiet, very little being sold; prices are same as last quoted. Choice grades only are wanted; with the holidays over we may look for more activity in the honey line. Beeswax, 28 to 30.

R. A. BURNETT & Co.,

Dec. 18.

199 S. Water St., Chicago, Ill.

SAN FRANCISCO.—Honey moves very slowly at present, as high prices have curtailed the demand. With light offerings and few arrivals of new stock, prices are firmly maintained. Light amber, extracted, 7 to 7½; water-white comb, 16 to 17; white comb, 15; water white, extracted, 8 to 8½.—*Pacific Rural Press.*

Dec. 21.

DENVER.—The local demand for comb honey is light at present, and we do not expect much improvement until after the holidays. We quote No. 1 white, per case of 24 sections, \$3.25 to \$3.50; light amber and No. 2, \$2.75 to \$3.00. We now have a good stock of very fine extracted honey which we offer at 9 to 10 cts. for strictly white alfalfa; light amber, 8 to 9; strained amber honey, 6½ to 7½. We are paying 22 to 24 for clean yellow beeswax.

THE COLORADO HONEY PRODUCERS' ASSO'N,

Dec. 10.

F. RAUCHFUSS, Mgr.

BUFFALO.—The demand for honey is very slow. The quantity in our market is small; and if the demand were fair for a short time it would soon clean up what is here. We quote fancy white comb, 16 to 17; No. 1 ditto, 15 to 17; No. 2 ditto, 13 to 14; No. 1 buckwheat, 11 to 12½; No. 2, 9 to 11; No. 1 white extracted, 8 to 9; ditto dark, 7 to 7½. Beeswax, 30 to 35.

Dec. 11.

W. C. TOWNSEND.

ST. PAUL.—Fancy white clover, new, per lb., 18; strained, in 60-lb. cans, per lb., 10.

Dec. 10.

W. H. PATTON,
Sec. Bd. of Trade, St. Paul, Minn.

WHAT HAS MUTH GOT NOW?

J. T. CALVERT, Business Manager

\$1 per year.
When paid
in advance:
2 years, \$1.50.
3 years, \$2.00.
5 years, \$3.00.

POSTAGE IS PREPAID by the publisher for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila, Samoa, Shanghai, Canal Zone, Cuba, and Mexico. Canadian postage is 30c per year. For all other countries in the Postal Union add 60 cents per year postage.

CHANGE OF ADDRESS. When a change of address is ordered, both the new and the old address must be given. The notice should be sent two weeks before the change is to take effect.

DISCONTINUANCES.—The journal is sent until orders are received for its discontinuance. We give notice just before the subscription expires, and further notice if the first is not heeded. Any subscriber whose subscription has expired, wishing his journal discontinued, will please drop us a card at once; otherwise we shall assume that he wishes his journal continued, and will pay for it soon. Any one who does not like this plan may have it stopped after the time paid for it by making his request when ordering.

HOW TO REMIT. Remittances should be sent by Draft on New York, Express-order or

Money-order, payable to order of The A. I. Root Company, Medina, Ohio. Currency should be sent by Registered Letter.

AGENTS. Representatives are wanted in every city and town in the country. A liberal commission will be paid to such as engage with us. References required.

Foreign Subscription Agents.

Foreign subscribers can save time and annoyance by placing their orders for GLEANINGS with any of the following authorized agents, at the prices shown:

PARIS, FRANCE. E. BONDONNEAU, 142 Faubourg St. Denis. *Per year, postpaid, 7½ fr.*

GOODNA, QUEENSLAND. H. L. JONES. Any Australian subscriber can order of Mr. Jones. *Per year, postpaid, 6/.*

DUNEDIN, NEW ZEALAND. ALLIANCE Box Co., 24 Castle St. *Per year, postpaid, 6/.*

\$53,700

Made by O-HI-O Cooker Agents in 1905 selling the

OHIO combination Steam Cooker- Baker.

We have many agents making \$5 to \$10 daily. Write us and we will give you names of agents near by who are making at least \$5 daily. We can easily prove that the "O-HI-O" is the best money-maker you ever heard of, and will make you more money than any thing you ever sold or are now selling. *Write us at once and we will prove it.*

Guaranteed to save 50 per cent in fuel, labor, time, and provisions. A whole meal cooked over one burner on any style stove. It assures you deliciously cooked hot meals; *30 days' trial.* No intermingling of odors or tastes. Fine for use in summer cottages. A necessity every day of the year. The only healthful way to cook foods and breadstuffs.

Handsomely illustrated catalog free.

"O-HI-O" COOKER CO.
908 Jefferson Av., Toledo, O.

Why the Price is High.

The *Bee-keepers' Review* enjoys the distinction of being sold at the highest proportionate price of any bee-journal published in this country, and

There is a "Reason."

It has no connection whatever with any supply trade, or any other business, and must depend, for its existence, solely upon the profits that accrue from its publication. Of course its editor might take up the supply trade, but his tastes are not in that direction, and he prefers to keep his mind wholly unbiased by the influence of trade.

Then, again, the *Review* has become what might be called

The Specialist's Journal;

that is, it appeals most strongly to the man who is keeping bees to make money; hence it can never hope for more than a moderate subscription list.

For this reason it

Can't be Published at Less

than its present price; but the man who really needs

it, the one who is keeping bees as a business, as a specialty, or even as a money-making side-issue, is only too glad to get the paper even at \$1.00; as the knowledge thereby gained brings to him many dollars in the course of a year.

Once a bee-keeper of this class reads the *Review* a year or two, he is almost certain to keep on reading it; and it is to induce a man to give it this trial that I sometimes make

Special Offers.

Just now I have about 200 complete sets left of the back numbers for 1907 that I will send free, as long as they last, to new subscribers for 1908. The information in these issues is just as valuable now as when first published. Send \$1.00 and you will get the *Review* for 1907 and 1908. This will be only 50 cents a year, and, when your time is out, if you don't care to renew, we can part as friends, and no harm done. For \$2.00 you can get the *Review* for 1907 and 1908 and the book *Advanced Bee Culture*. Book alone, \$1.20.

W. Z. HUTCHINSON, :: :: :: FLINT, MICH.

At Just Half Price!

The *American Bee Journal*, which is now a 32-page monthly, in its 48th year, is the oldest bee-paper in America. It is only 50 cents, but you can have it at just half price (for 25 cents) when taken with any one of the following list of standard bee-books:

Dr. Miller's "Forty Years Among the Bees".....	\$1.00
"Langstroth on the Honey-bee".....	1 20
Cook's "Bee-keeper's Guide".....	1 20
"A B C and X Y Z of Bee Culture".....	1 50
"Amerikanische Bienenzucht" (German).....	1 00
"Bees and Honey" (Newman).....	.50
Doolittle's "Scientific Queen-rearing".....	.50
(Leatherette Binding.)	
"Honey-Money Stories" (68-page pamphlet) ..	.25

Just add 25 cents to any of the above prices, and we will mail you both the book and the *Bee Journal* for one year. Sample copy of *Journal* free.

SQUABS FOR PROFIT

By William E. Rice and William E. Cox

This is the most complete and exhaustive work of the kind ever published on squab raising. It is not a book of second-hand references, but contains the hard-earned experiences of the authors. Every detail of their methods of selecting, breeding, feeding, killing, and marketing squabs is given in plain, simple language, with numerous illustrations, all taken from the home plant of Mr. Rice in New Jersey. The chapter on buildings, their location, and how to construct them is concise, specific, and complete.

The squab industry is increasing rapidly. This book is a guide for those who want to know, and a standard reference work for the old-time breeder. It is not based on mere theory, but contains the true story of the most successful squab plant in this country. The story of how \$50, the original investment, has grown to \$3,000, is fully given by Mr. Rice. He took the money made by the squabs, enlarged and developed his plant, until it is now complete.

The illustrations are simply superb. They were taken especially for this work. The plants and specifications for buildings, etc., are as complete as an expert architect could make them. The book contains about 150 pages, each 5x7 inches, printed on fine paper. Bound in cloth and sent postpaid for 50 cents.

It is time for us to remind our friends who have large apiaries who depend on outside help not to put off securing this help until the season is immediately before us. Mr. H. T. Chrisman, who carried a six-line want ad. in December 1st GLEANINGS, writing under date of December 10th says: "I have been flooded with applications." This shows the value of GLEANINGS; but we caution you not to wait until April or May and then expect to get help so readily. This is the time to send in your want ads.

HOW A NEW YORK SUBSCRIBER REGARDS GLEANINGS.

The A. I. Root Co.—A merry Christmas to all, with 999 thanks for the present style of wrapper GLEANINGS is mailed in. When I kicked about sending it out without a wrapper I did not suppose you would go and do it better than ever; but that is just the A. I. R. of it. I enjoy reading GLEANINGS the best of any paper I ever came across—but always feel sad when I stop and think that our friend J. H. Martin will never pen another page for it, for that was my first page to read. C. R. MORTS.
 Mohawk, N. Y.

"SURE HATCH" INCUBATORS.

Nothing has done so much to revolutionize the poultry industry as the invention and use of well-made incubators sold at a comparatively low price, placing them within the reach of nearly all poultry-raisers.

One of the concerns which has taken a prominent part in this revolution is the Sure Hatch Incubator Co., of Fremont, Nebraska, and Indianapolis, Indiana. It has made quite a specialty of supplying in-

cubators to the farmer class, who demand something simple, effective, and cheap. This company has had a long and successful career in developing this business. They are peculiarly well situated for shipping their goods; for example, their factory is connected with the tracks of the Union Pacific, Chicago & Northwestern, and Burlington & Great Northern Railroads. At their place in Indianapolis they are even better situated. This insures for them great promptitude and low rates in filling orders to all parts of the country.

They issue quite a catalog, which is well worth sending for, and which, too, is gladly sent to all applicants. You may send to the address which is most convenient to you. Their advertisement may be found on page 51 of this issue. Kindly mention GLEANINGS when you write.

IWAN POST-HOLE AUGER.

The best spade is a poor hole-digger, and the old-fashioned double-spade diggers and augers are not much better. But post-hole digging, instead of being tiresome and slow, is now easily and rapidly done by the use of a most remarkable labor-saving post-hole and well auger, made by Iwan Bros.—a name that guarantees quality. The bowl of this practical auger consists of two interlocking crucible-steel blades, scientifically shaped so that they sink themselves in any kind of soil almost without any pressure. These full turns do it. Then, in pulling them out, there is not the slightest resistance from suction. These strong blades are attached to a malleable arch with a strong handle of convenient length. These augers are made in all sizes from 3 to 14 inches. A more simple and practical hole-auger could not be made. Iwan Bros., Sreator Ill., will be glad to give you complete information. Write them to-day, and mention this paper.

THE A. I. ROOT CO.
MEDINA :: :: OHIO

Only two years have elapsed since we brought out an edition of 15,000 copies of the well-known A B C of Bee Culture. This brought up the number to 100,000 copies, thereby surpassing in popularity all other bee-books ever printed.

The demand for these has been so great that we were compelled to undertake a new edition at once, and in doing so we took the opportunity to revise and greatly enlarge it again, though it had been generally considered quite a large book.

In doing so we brought in new blood to assist us, give new ideas, and otherwise enable us to produce as good a book as it is possible to make at a popular price. If you will carefully examine a copy you will be prepared to admit the new volume is quite an improvement on its predecessors. To keep pace with improvements it contains nearly 100 double-column pages more than the previous edition.

The new methods of queen-rearing have been carefully reviewed, and the main points incorporated in the new edition, so that the practical bee-keeper who possesses a copy will have the best ideas of the subject constantly by his side for reference.

The new methods of wax-production are treated in an exhaustive fashion; and as this subject is now of more importance than formerly, more space has been devoted to it.

The new power-driven automatic extractors are amply illustrated and described. The subject of diseases has received entirely new treatment to keep pace with the new discoveries of the last few years. The laws relating to bees have for the first time received full treatment. No other bee-book treats of this very important subject. Honey, sugar, nectar, and glucose are carefully defined in accordance with the demands of our new pure-food laws.

In accordance with the ideas of its first author, A. I. Root, the new A B C and X Y Z is *eminently practical*.

German edition (new), paper covers, \$2.00; cloth-bound, \$2.50. Postpaid anywhere. This is the famous A B C in the language of the Fatherland, to suit our many German friends.

French edition (new), cloth-bound, \$2.00, postpaid. This is another edition, translated into the beautiful language of France.

M'CLURE'S MAGAZINE.

In making up your list of periodicals for the coming year we wish to say a word in season for the above magazine. We believe it to be, in a very true sense, the friend and benefactor of the plain people of this nation. Its exposure of monstrous frauds, both financial and political, is deserving of the highest praise. It could probably have made immense sums of money by concealing the truth, but it chose the straight course of honest duty. Such a journal deserves success.

THE GERMAN NURSERIES.

If you want trees and plants that are extra hardy we think the stock grown at the German Nurseries, Beatrice, Nebraska, will suit the most exacting. It is right in the blizzard region where, unless plants are very vigorous and hardy, they can not survive. The proprietor of these nurseries is Mr. Carl Sonderegger, a very experienced German nurseryman who started in business in 1886, since which time he has built up a large trade in nursery and plant stock. He knows just what will grow in our cold north-western States, where the peculiar winter conditions render the selection of trees a subject for expert knowledge, such as only a few possess. Many thrifty persons have lost money by ordering trees from irresponsible agents and others who sold them stock by no means adapted to the rigorous conditions of the West. We believe any buyer of trees would be safe in ordering from Mr. Sonderegger.

BIG-EARED CORN.

If you are interested in corn, the advertisement of Ratekin's Seed House, of Shenandoah, Iowa, will appeal to you. This house is in the center of a great corn region where the farmers take the greatest interest in the improvement and amelioration of the corn-plant. It is not far away, either, from the home of Professor Holden, the great corn expert who has so enthused the farmers of Iowa that each one is laboring to increase the value of the corn crop of the State. Any of our readers who are interested in corn culture ought to get in touch with

Ratekins if they are anxious to improve the crop in their own immediate locality. In addition to securing fine seed we believe they will also get excellent advice on corn culture (if they desire it). Their catalog, which may be had free for the asking is quite a treatise on corn and other useful farm seeds on which great industries rest. It is not a pretty book for the children, but a valuable monitor on farm seeds and farm crops for money-makers.

WEAVING RUGS AT HOME.

Recently there has been a revival of home handicrafts in various parts of the country. This is due to various causes, one of which is a great desire on the part of many to have something original, and at the same time durable and substantial. It is a remarkable fact that the fine rugs and carpets on the floors of rich men's mansions are home-made articles. These are not made in factories, as is supposed by many; on the contrary, they are the product of humble homes in Turkey, Syria, Persia, and India, where factories are unknown.

This being so, we feel certain many of our readers will be much interested in the advertisement of the Deen Loom Co., Harlan, Iowa, on the back cover page of this journal. We think their announcement will have a special interest to GLEANINGS readers, because many of them are handy men and women who would soon learn how to use a weaver's loom if they had one.

It is well known that the finest and most expensive fabrics are woven on what seems ridiculously simple apparatus. We believe that success in this line lies largely in the taste and skill of the individual worker rather than on intricate and expensive machinery. The Deen Loom Co. are so thoroughly convinced of the intrinsic value of the loom they manufacture that they are now accepting orders on the installment plan of payment. If the field where you live is not occupied already by some weaver, there is a chance for you to do some business with your neighbors in making rugs for them. The company takes especial pains to give its customers all necessary advice in learning to operate a loom, and is happy to hear their customer has been successful. They send a nice catalog on request.

A SUBSCRIBER'S ORDER for FENCING.

It is quite amusing to us when talking to a prospective advertiser to hear him say that GLEANINGS will probably do well enough for bee-supply advertisers, but he doubts whether it would do for his particular product. Time was when we had to use a good many arguments to show that GLEANINGS readers were good purchasers in hundreds of other lines, but now we seldom hear the above comment. Occasionally some one wholly unacquainted with GLEANINGS requires some convincing evidence. To such we submit the case of Mr. Shackelford, and a valued advertiser, Messrs. Kitselman Bros., Muncie, Ind.

COIL SPRING FENCE

Made of high carbon Steel Wire
Horse-high, Bull-strong, Chick-
en-tight. Sold direct to the
Farmer at lowest manufac-
turers prices on 30 Days Free
Trial, freight prepaid. 100 page
Catalogue and price-list free.

KITSELMAN BROS.,
Box 21 MUNCIE, IND.

The above is the advertisement which cost the advertiser during the entire season \$35.90. In the next column is the report of our subscriber whose single order was nearly ten times the amount that this advertisement cost in GLEANINGS for the entire season. Bear in mind that this is only a single order, and, according to our understanding, Messrs. Kitselman Bros. had a good many more which they trace to GLEANINGS IN BEE CULTURE.

RESULTS. If you have goods to sell, isn't it worth while to try a paper which pays others so well? Here is a single order bringing the advertiser ten times the amount of his entire account with the paper for a year. Remember, too, the case of Mr. Snyder who received orders for a thousand queens at an expenditure of \$11; also the case of Mr. Taylor, whose season's advertising cost about \$50, and he received more than \$1000 worth of business which he traced to GLEANINGS.

OTHER ADVERTISERS BESIDES KITSELMAN BROS. We have for several years carried representative advertisers such as American Steel & Wire Co.; Page Woven Wire Fence Co.; Coiled Spring Fence Co.; Brown Fence and Wire Co.; Mason Fence Co., and others.

A paper that gets results in a line like the above can not help being valuable for those advertisers who have merchandise used by agricultural, rural, and suburban classes generally. Write us if you have any doubt as to the advisability of using our columns, and learn what our experience, if any, has been with advertising similar to your own. We are not at all anxious to get an account which does not appear adapted to our paper, for we want to hold those we have from year to year and do not want to disappoint any one, and we never urge an advertiser to use our paper without feeling reasonably sure that it will pay him.

For particulars along the above lines, or regarding our rates, address

ADVERTISING DEPT. GLEANINGS IN BEE CULTURE, MEDINA, O.

Mr. Shackelford's \$330. Order.

Okolona, Ark., February 18, 1907.
THE A. I. ROOT CO.,
Medina, O.

Gentlemen:—Some days ago I gave Kitselman Bros. an order for wire fencing to the amount of \$330.24, but the fencing I have not yet received. I received a notice from them that it would have prompt attention, but this is the last I have heard from them. I mentioned that I did not hesitate to give them the order for I saw their ad. in GLEANINGS, and, of course, I think it will come up O. K. I wrote them a few days ago but have not had time to hear from them yet. I will wait ten or fifteen days, and if I do not hear from them I will write you again.

Yours truly,

GEO. SHACKELFORD.

We wrote Messrs. Kitselman Bros. in behalf of our subscriber, and they promptly advised us that, owing to the great amount of orders received about that time, there had been a little delay, but assured us that Mr. Shackelford's order would go out at once.

Note Mr. Shackelford's confidence in the advertising columns of GLEANINGS. This is representative of the feeling of our subscribers generally.

Paint Without Oil

Remarkable Discovery that Cuts
Down the Cost of Paint Seventy-
five Per Cent.

A Free Trial Package is Mailed to Every
One Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powderpaint. It comes in the form of a dry powder, and all that is required is cold water to make a paint weather-proof, fire-proof, and as durable as oil paint. It adheres to any surface, wood, stone, or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer, 202 North St., Adams, N. Y., and he will send you a free trial package, also color-card and full information showing you how you can save a good many dollars. Write to-day

"If goods are wanted quick, send to Pouder."
Established 1889.

Ahead of the Game

Or 300 Lbs. of Honey to the Good

It has been said that "Success is made up of trifles, but success is no trifle." Is there any line of business in the world to which that saying applies more appropriately than to the bee business? Certainly we bee-men know of none. The profits of the business are affected favorably or adversely by so many seemingly trivial details that neglect of any of them often proves most unfortunate. It is time right now to order supplies for the coming season, and get into the game as Mr. Jones has wisely done. Note what he says:

Mr. Walter S. Pouder,
Indianapolis, Ind.

Atwater, Ill., Dec. 2, 1907.

Dear Sir:—I received my bee-supplies to-day, every thing in fine shape, and I never saw as fine a lot of supplies. I had naturally supposed that, in getting so large an order, some of the goods would be rough; but I find every article to be perfection. I am now ready for the honey harvest. The bees were ahead of me this last season, and I am satisfied that I lost 300 pounds of honey by not being prepared. That new A B C of Bee Culture is something grand.

Wishing you continued success,

M. A. JONES.

Please observe, too, that I am still making a specialty of prompt deliveries and perfect shipments.

New edition of the A B C of Bee Culture now ready. By mail, \$1.50; by express or freight with other goods, \$1.25. Catalog of Bee-supplies free for the asking, and it gives prices for 1908 goods.

I buy and pay the highest market price, cash or trade, for beeswax, and have a large stock of fine white-clover honey for sale. Write for prices.

Walter S. Pouder,

513-515 Massachusetts Avenue, Indianapolis, Ind.

No. 1

SEVERAL CASES are reported at Neukirch observation-station, Switzerland, in which "the after-swarm with the young queen issued before the prime swarm with the old queen."

ALLAN LATHAM, p. 1564, advocates ample space under frames with small entrance for wintering. Right you are, my friend, and I think the general tendency is now in that direction. I don't want less than two inches under bottom-bars all the year around.

HEARTSEASE HONEY, according to most of the bee-keepers at the Chicago convention, is rather dark, but several said that with them it was light. My assistant says, "That very white honey we had was heartsease; I don't think any thing about it; I know it was."

WINTER CONSUMPTION (outdoors, as I understand it) for the five months, November to March, reported from all the Swiss stations, averaged, for ten years, 12 5 pounds. For the four months, December to March, 11 pounds. Varied from 5 to 28 pounds, for five months.

BY THE COURTESY of Editor U. Kramer, the beloved leader of Swiss bee-keepers, I am in receipt of reports of Swiss apicultural observation-stations. These were started to the number of four more than 20 years ago, and now number more than 30. Oh for a Herr Kramer in this country to bring us abreast with little Switzerland!

I TRIED a few cases of feeding in cellar. I put a section of honey in the 2-inch space under bottom-bars, letting it touch the cluster of bees. In about 24 hours the section was cleaned out dry, although the colony had heavy winter stores; but it excites the bees, and that is probably not good for them.

[That is just the trouble. Such feeding excites the bees.—Ed.]

THE PLURAL-QUEEN SYSTEM is pronounced a success, page 1555, with perforated zinc. What advantage has it over the Wells system? That allowed two queens separated by perforated wood, and was boomed in England a few years ago, but now nothing is said about it. I can see big advantages in several unseparated queens in one hive, but with excluder I don't believe there's any thing in it. [Why? In the Wells system there was no intermingling of the bees, and each lot of bees with their queen had a separate entrance. In fact, the Wells idea was little more than a tenement hive, having two colonies, each sharing the warmth of the other. In the perforated-zinc plan the queens only are separated; but the bees mingle all together. In this respect the colony principle is more perfectly developed. As one strong colony is better than several small ones, so the perforated zinc plan ought to be better than the Wells system.—Ed.]

I DON'T BELIEVE in feeding in winter, but another Straw will show that I have tried it on a small scale by way of experiment, and after reading "What to Feed Bees in Cold Weather," p. 1556, I am moved to urge you very strongly, Mr. Editor, to try putting the feed *under* instead of on top. Of course, with a weak colony clustered high up it is not practicable; but where the bees can be induced to come down, as a fair colony will on any mild day in winter, and on any day in the cellar, feeding below has real advantages. It doesn't disturb the bees by uncovering them. A brood-comb can be put under, or Good candy in any dish, wooden or earthen; and if the candy is too soft it can make no trouble below as it can on top. "There isn't room below?" With a 2-inch bottom-board there's plenty of room, and you ought to have nothing less than 2 inches under bottom-bars for other purposes. But in any case, can't you make room below as well as above. [Your idea of putting the food under is good, in so far as it would eliminate the possibility of the food daubing the bees.

For outdoor feeding the position would be bad, but all right for the cellar.—ED.]

WM. M. WHITNEY, p. 1594, says the case of the bee-keeper is not parallel with that of the stock-raiser. That's just it, Bro. Whitney, and I'd like to see the bee-keeper have the same show as the stock-raiser. As it is now, it's all a gamble whether he may occupy a certain territory undisturbed, or be crowded out by others. I'd be willing to pay good money to be as sure of my ground as the stock-raiser is of his.

So you think, Bro. Whitney, you might grant me control if I'd hopple or clip my bees. How about fish? They're neither hopped nor clipped, no one even pretends to own them as bees are owned, and yet legislation clearly defines territory upon which one may not encroach in catching them. Very likely you are with the large majority, but "the world do move." Many years ago I rashly advocated legal control of bee territory, and called down wrath upon my head. So far as I know I was entirely alone; at least if any one agreed with me he never said so. Now I'm not alone. Not only do many good men agree with me, but in some places sole control of bee-territory is an accomplished fact, made so by legal enactment. If it doesn't come here it's only because we are not so progressive as the people on the opposite side of the globe.

READING what is said on p. 1557, the beginner is likely to think that he should use split sections. Does GLEANINGS really advise this? [Every man has his own ideas regarding fixtures, but from the standpoint of dollars and cents, we can not see that it would pay any bee-keeper to throw away good supers, section-holders, and other appliances to adopt the split-section plan. We are not even sure that it would pay a beginner to start out with the split sections.

After the split sections are purchased, and every thing is in readiness, foundation may be put into four at once, very rapidly. But this saving of time does not mean much of a saving of money, for such work is usually done when time is not very valuable. A better grade of comb-honey is produced if foundation is held on all four sides, but we do not believe that the split-section plan has any merit as far as the appearance is concerned over the melted-wax plan for instance, for fastening full sheets on all four sides of any style of section. The latter plan has the further advantage that no special section is needed.

Split sections cost 50 cents a thousand extra. Or, if the bee-keeper has his own foot-power saw, he may reduce this extra cost a trifle by doing his own splitting, but not enough to be worth mentioning. Now a helper's time in the winter would not ordinarily be worth 10 cents an hour. But figuring the labor at 10 cents an hour, nevertheless, we have found that the cost of putting full sheets, fastened on all four sides, in the unsplit section, is not far from 50 cents per thousand, for it takes about five hours. It will be seen that this cost is practically the same as the extra first cost of the split

sections. This means that the labor in putting foundation into split sections is an expense that may be eliminated by adopting the plan of putting full sheets in ordinary sections by means of hot wax from the wax-tube. The wax used would not cost any more than the extra wax in the larger amount of foundation needed for the split-section plan.

Finally, we have learned that there are many who object to the appearance of the split sections. Just how serious this objection would be, we can not say.—H. H. R.]

A BIG FIELD FOR BOTTLING HONEY.

A RECENT canvass made in one of our large cities showed that little or nothing was being done with the bottling trade for extracted honey. While comb honey was fairly well represented in the retail groceries they had no liquid honey to speak of. We are in a position to know that the same condition exists in many of our other large cities. It only goes to show that much more of extracted might be disposed of, and what a field there is for individual bee-keepers to bottle their own honey, especially if they are near a large city or town! This would have the effect of increasing enormously the consumption of extracted, and at the same time have a tendency to advance prices.

It is not because *good* bottled honey would not sell, but because none is offered. Before the new National pure-food law went into effect the market was injured and practically killed by adulterated goods masquerading under the name of "Pure Honey," or "Farm Honey."

Mr. Selser, of Philadelphia, Mr. Weber, of Cincinnati, Mr. Pouder, of Indianapolis, and some others, have demonstrated that pure goods will sell, and bring fairly remunerative prices. What these men have done for their respective cities others can do. There was never a better time to develop the bottling trade than now.

Always put up a fine table honey, well ripened, and then be careful not to spoil a good trade, once worked up, by putting out inferior honey. We know of one case where a bottler having a fine trade practically ruined it by putting out an off grade of pure honey. It was off in body and color, and now he can not sell honey that is first-class.

CLIPPING QUEENS VS. QUEEN-TRAPS.

It takes considerable courage to run directly counter to orthodoxy. For example,

especially in bee culture, it is generally considered the correct practice to clip queens' wings in either a comb or extracted honey-producing apiary. The argument in its favor has been mainly that it saves climbing tall trees, chasing after swarms that may run away with their queens, and last, but not least, a large amount of labor in the hiving of the swarm, because it hives itself.

Mr. R. L. Taylor, who dissents somewhat from this, recently made the statement that "clipped queens are an unmitigated nuisance in swarming time." In the *Bee-keepers' Review* for December he defends the statement on the ground that queens are liable to be superseded at any time for any cause without the knowledge of the apiarist. Where a supersedure has taken place in a hive with such queen, a swarm will issue with the new queen, and the apiarist, supposing that it will return, finds out too late that his swarm has left for parts unknown. Then he adds:

Swarms issuing with a clipped queen conduct themselves in quite a different manner from that of those having a perfect one—the latter clustering quickly and completely, as a rule, and if another swarm is out and clustered, are not liable to discover and cluster with it; consequently, they may be secured and promptly hived, while the former, in their search for their queen, hunt the premises over, and if there be a swarm out are sure to find and unite with it, and by their dilatoriness give abundance of time for other swarms to issue and unite with them. Often they will not cluster at all; and if there has already been any swarming that day, they generally make persistent efforts to adopt the hive of the former swarm; and if there have been several previous swarms the same day, only the most skillful and rapid management can prevent a general mix-up. The bees are not only persistent in their attempts to enter strange hives, but, in spite of all, are more or less successful; so that often when one, by the use of sheets and smoke, imagines he has done a good job in his efforts to defeat their attempts, he finds later that one-half or two-thirds of the swarm has circumvented him.

Concluding, he believes that the queen-trap has advantages over the clipping method because it will catch any or all queens in the hive, virgin or laying, whether supersedure took place or not. While it will not prevent the mixing of the swarms, he says it will greatly mitigate it. The trap also has the advantage that the apiarist can see from which hive a swarm may have issued by looking into the trap.

Mr. Taylor might have added that the trap saves some long hunts for queens and the delicate process of clipping. A trap can be clapped on a hive in a few seconds, while it sometimes takes many minutes, if the colony be strong, to find the queen.

The only objection to the trap is the expense and the fact that it may hinder to some extent the passage of bees laden with honey going into the hive; but this latter difficulty has been overcome almost entirely in the modern trap.

THE DANGER OF GLUCOSE SUGARS.

THE *Louisiana Planter*, of November 30, very properly calls attention to the dangers of starch sugar, or what is known to the American trade as "grape sugar," but which might with greater propriety be called glucose sugar. For evidence, our contemporary calls attention to an article in the *Journal of*

the *American Medical Association* which gives a very able summary of all the data available on the question of the suitability of this sugar for human beings. The article goes to show that starch sugar is undeniably dangerous, and that it is practically impossible to have it free from injurious sulphites when manufactured on a large scale. On a small scale it would not pay, for a substance must be cheap when it is to be used for the purposes of adulteration. The author of the article in question, a Mr. Lippman, does not hesitate to condemn this so-called grape sugar in no uncertain words.—W. K. M.

SOME NEW BEE TERRITORY IN PROSPECT IN WYOMING.

WE have received from the State Board of Immigration, Cheyenne, Wyoming, a very handsomely gotten-up book on the resources of Wyoming. It comprises over 140 pages of reading-matter, tastefully embellished with a number of excellent illustrations in "half-tone." As the book is compiled by the regular government officials of the State, there is no doubt the statements are reliable and accurate. Particulars of all government and semi-government projects are given, with the address of those in control. Naturally Wyoming is one of the most favored and most picturesque regions on the earth, with resources that are practically boundless, and a climate which is almost perfect from the white man's standpoint. As a honey State it will probably rival Colorado, Texas, Utah, or California, at no distant date. Any of our readers who are actually seeking a new location in the West, where they can grow up with the country, can send to the above address and get this book.—W. K. M.

GLUCOSE, AGAIN; IS IT POISONOUS TO THE HUMAN STOMACH?

It might be supposed, from the tenor of its articles, that GLEANINGS is rather against the glucose industry, and that no one else is so prejudiced as we are. As a matter of fact, this antipathy is quite common—so much so that the company making this stuff changed its name from the American Glucose Co. to the American Corn Products Co. in deference to widespread popular opinion. The *Louisiana Planter*, the leading journal of the cane-sugar industry, in a recent issue sets forth the situation in this wise:

It is now announced in Chicago that the Corn Products Manufacturing Company contemplate the immediate erection in that city of another great glucose manufacturing and refining plant, the estimated cost of which will be five millions of dollars. The land for this great establishment has already been secured on the line of the Chicago drainage canal, and it is said the expected capacity of the works will be a loaded car movement of 125 cars per day in and out, which will mean the employment of 750 people.

Incidentally it is stated that from 5 to 6 million gallons of water will be needed for the daily use of the establishment, and borings have been made satisfying the management that they can secure an adequate water supply of excellent quality at a depth of some 1600 feet, which will be done with artesian wells. A storage and transfer elevator of a million and a quarter bushels capacity will be erected, and the interior is to be of tile laid in concrete.

A rather novel point is brought out in this connection; and that is, that the woodwork is to be done away with in this new factory, for the reason that the life of a glucose factory is admitted by its builders not to exceed ten years, because of the deterioration of wood as affected by the processes in use. If the manufacture of glucose from corn starch and sulphuric acid destroys the buildings in which the materials are manipulated, what can we expect that this same combination will do to the human anatomy that is now called upon to take in this country some 1500 tons of it per day—an amount far in excess of the Louisiana cane-sugar crop, and about equal in weight to the present beet-sugar crop?

Again, the following on the same subject appears in *Louisiana Planter* for Dec. 14:

The appeal of the producers of glucose to be permitted to call it "corn syrup" is causing considerable interest in food circles. The extraordinary way in which modern glucose is made by boiling starch in an attenuated solution of sulphuric acid, is a chemical process that seems to have a bad name because of its objectionable origin in the process of its conversion from corn starch to the liquid or solid glucose. The Corn Products Co. have changed their own title from the American Glucose Co., of years back, and are now desirous of labeling their goods "corn syrup," which is essentially a misnomer, as the production of this kind of corn syrup is not possible by the ordinary presence of evaporation, which produces sugar-cane syrup, sugar-beet syrup, sorghum syrup, and maple syrup.

The use of injurious (and, in fact, of dangerous) chemicals in the manufacture of food stuffs was practiced more than half a century ago. It is well known that the sugar of lead is probably the best clarifying agent for refining sugar. Dr. Evans refers to it in his "Sugar Planter's Manual," published about 1845, and says that it became necessary to prohibit by law the use of lead in sugar-refining, owing to the dangers to human health and life incident to that process. In the earlier history of the glucose industry it was a notable fact that one of the chief difficulties connected with it was that of entirely eliminating the free sulphuric acid in the concentrated syrups. In order to do this it was necessary to use considerable lime; and this, combining with the free sulphuric acid, produced gypsum, or land plaster, which floated like clouds throughout the liquid mass, and was very difficult of removal, even by filter-press filtration. Liquid glucose manufactured from corn starch by the sulphuric-acid process is now turned out apparently as clear as crystal; but the central fact remains; that is, its manufacture with that very dangerous agent, sulphuric acid, and that free sulphuric acid has very frequently been present in samples of glucose offered for sale. The word "corn," if utilized in labeling glucose, will be so utilized in order to conceal some of the features of its objectionable origin. The label should properly read, "corn and sulphuric acid for table use."

W. K. M.

BEE-TALKS BEFORE SCHOOL-CHILDREN.

SOME time ago Mr. E. W. Pease, of Chicago, wrote us concerning a talk on bees which he had given before one of the primary schools of that city. To give some idea of the interest shown, he obtained and sent to us the essays written on the subject by the children the day following. All of these showed that the most careful attention had been given, and that, in most cases, every part had been clearly understood. This is all the more remarkable since the children were in only the third grade, and were, therefore, not over nine or ten years old.

From about twenty-five papers we have selected four to place before our readers—not because they are the best, particularly, but because they more nearly represent the average.

BEEES.

The queen bee is a little larger than the others. A man by the name of Mr. Pease has an apiary. The father bee is called the drone. There are three differ-

ent kinds of bees in each hive. They are the queen, drone, and worker. If a bee ever gets into the wrong hive the other bees will kill him. There are about forty or sixty thousand bees in each hive. The queen lays her eggs in the cells. The bees put the honey in the cells. The honey-comb is made of pure wax. The bees go to some flowers and get nectar and put it in their honey bag. The bees take hold of the corner of the cell and pull the wax out. When you want to have an apiary you number the hives. There is only one queen in each hive. If there is two one will kill the other. A bee has two pair of wings. The queen bee looks nearly the same as the rest except that she is larger. If the honey-comb is not pure wax the bees will not touch it. A bee will not sting if you will not hurt it. When the bees swarm the queen is always with them. When they swarm you take a dishpan and hit the twig and they will fall into the pan and then you put them in the hive. When a bee stings you it will die.

ARTHUR FRIBERG.

MR. PEASE AND HIS BEES.

Thursday Mr. Pease said he would tell us a story about his bees. First he talked to us a long time about bees, and then showed us some bees he had in a case. It was very interesting. There was a swarm of bees, and with them there was a queen. Mr. Pease said that the bees would not hurt us unless we hurt them. Mr. Pease said the bees and the queen-bees are very nice when they are not angry. There are thousands of bees in one hive.

Did you ever know that bees are mailed to other countries?

They are put in a box, and sent away. One bee must stay at least two or three thousand eggs a day. He said he was going to give us some cheese and honey.

ADENA HALBERG.

MR. PEASE AND HIS BEE-FARM.

Mr. Pease owns a bee-farm. He is a very nice man. He told us that there were forty to sixty thousand in a hive. Mr. Pease's office is on the corner of Winnetmac Ave. and N. Robey Street. He has a nice office. A bee never stings when he comes back from the honey-field. He is full of honey, and is too stiff to sting then.

You have to put a veil over your face or else you will be stung. There is only one queen bee in each hive. I like bees because they give honey. But I would not like it if I should get stung by one. The queen should make two to three thousand eggs a day, or else they would not think much of them.

EVERETT LINDSTROM.

BEEES.

Across the street from our school is an apiary. A man named Mr. Pease owns the farm. Yesterday he was in our room and told us about bees. He said "Bees will not sting when going to the honey-field or coming back, because when going to the field they are too anxious to get the honey, and when coming back they can not curve the abdomen. Bees will sting under only two circumstances; that is, when they are hurt and when excited. The queen is supposed to lay two or three thousand eggs a day. Bees almost always swarm."

ALLEN TRIMBLE.

A study of the papers as a whole reveals the fact that certain parts were remembered rather better than others, showing that children appreciate the wonderful revelations in nature. For instance, nearly every pupil remembered that a good queen should lay from two to three thousand eggs in a day; that the queen is larger than the workers; that there are three different kinds of bees in a colony, etc. Children have wonderful memories; and if they are told such things in an interesting way they almost never forget them. The bees in the observatory hive doubtless helped to impress the lesson on their minds.

It is an oft-repeated statement, but one which is, nevertheless, true, that it pays a bee-keeper to educate the public. Giving a simple and interesting lecture before school-children is one way of doing this, and there are many others.

INJURIOUS EFFECTS OF SULPHITES IN SYRUP AND MOLASSES.

FROM time to time GLEANINGS has furnished its readers with considerable data concerning the injurious effects of sulphites and sulphurous acid when combined with human foods and used as such. Some may have thought we were stretching the truth so as to get a case against syrup, molasses, and glucose. Our ideas on the subject were obtained from reading the reports of physiological experiments made in Germany, and from talks with men well versed in the techniques of sugar manufacture. Now comes a bulletin just issued by the United States Department of Agriculture which more than confirms all we have said. Sulphites and sulphurous acid have been found guilty on all counts. Every bee-keeper who sells honey locally ought to send for this bulletin, which we think is free to all. It was issued Nov. 22. As the report is founded on practical experiments made in Washington we will give the summary of results verbatim so that there need be no misunderstanding anywhere.—W. K. M.

These data clearly show that the administration of sulphites and of sulphurous acid in a free state in the quantities employed produces harmful effects. A tendency is manifested in practically every case to produce headache and digestive disturbances. In some cases these symptoms are not clearly marked, while in others they are extremely well defined. In many cases uneasy sensations and even pain were developed in the stomach and intestines, and there were complaints of "heartburn." The occurrence of this class of symptoms during the administration of the preservative and their gradual disappearance during the after-period seem to be conclusive evidence that they could have been due only to the effect of the preservative itself. There were also in some cases attacks of dizziness, and palpitation of the heart. In a few cases nausea was developed to the extent of vomiting.

It was recognized, as in previous experiments, that the mental attitude of the subject might play some part in producing these symptoms, or at least might affect the description of them by the man himself. That this, however, does not exercise a dominant influence was more than established by the remarkable effects of the administration of salicylic acid, where, with the same opportunities for mental effects of a depressing character, there was manifested, on the contrary, a persistent demand for more food, the salicylic acid apparently serving as a stimulant. There is no doubt, therefore, of the fact that the symptoms which are described in the medical history are those actually experienced by the young men, any tendency to exaggeration in the reporting of these symptoms having been carefully considered at the time.

In the case of the men who received sodium sulphite the conclusion is inevitable that the administration of this preservative in the great majority of cases causes headache, sensations of dizziness and occasional nausea, indigestion, pains in the stomach, and other unfavorable symptoms. With the men who received sulphurous acid in an uncombined state, headache was very common, there was a slight tendency to dizziness, accompanied in some cases by nausea, and a feeling of exhaustion and weakness.

In general, it may be said that the most prominent symptom was that of headache, which could hardly have been caused by the imagination. This symptom was very commonly and very persistently experienced at some time during the preservative period.

BODY WEIGHT.

The administration of the sodium sulphite was accompanied by a slight average loss of weight during the preservative period, but the full effect of the preservative in diminishing the weight of the body was shown only toward the end of the preservative period, and there was a continued loss in weight during the after-period.

It appears, therefore, that the administration of sulphurous acid in the form of sulphite tends to reduce the weight of the body slowly, and that this tendency

is continued for a considerable time after the withdrawal of the preservative. There was a very slight increase in the average weight of the body under the administration of the sulphurous acid in the uncombined form, which increase continued in the after-period. The final average effect upon weight for the eleven men shows no change in the preservative period and a slight decrease in the after-period.

THE NATIONAL CONVENTION AT HARRISBURG; A MARK OF APPRECIATION SHOWN TO GENERAL-MANAGER N. E. FRANCE.

OWING to one thing and another we have been unable to continue our report as given on page 1430, Nov. 15th issue. We now take it up where we left off.

We listened to a very interesting address by the Rev. N. E. Cleaver, on the subject "Is it practicable and profitable for the average bee-keeper to rear queens for market?" As we published an article from him on that subject on page 1445, in which he gives some of the main points of his paper, we will not go into a discussion of it here; but the address taking the negative side of the proposition was listened to with marked attention, drawing forth a great deal of interesting discussion.

We next listened to an interesting paper, although somewhat technical, on the insect enemies of the honey-bee, by Assistant State Zoologist Satterthwait, of Harrisburg. The main points were as follows:

The bee-moth (*Galleria melonella*); the wax-moth (*Achroea grisella*), Fab; bee-killer (*Promachus Fitchii*); bee-louse (*Braulta ceca*); oil beetle (*Meloe angusticollis*); fly (*Phora incrassata*); meal-moth and the bee-beetle (*Trichoides apiarius*). Of less importance are predaceous wolf-flies, dragon-flies, wasps, hornets, ambush and assassin bugs, ants, and sphinx moths. Aristotle, Virgil, Columella, and other ancient writers mention the bee-moth as a formidable enemy of bees. It was first mentioned in this country by the *Boston Patriot* as having made its appearance near that city in the spring of 1806. It was noted at Mercer, Pa., in 1826, and by 1826 had overrun Ohio. At the present time probably every apiarian knows the work of the moth, and that it can not be successfully controlled in the old-fashioned box hives. Its life history is as follows:

The moth, from head to the end of the folded wing, is $\frac{3}{4}$ to $\frac{1}{2}$ of an inch; the expanse is $1\frac{1}{10}$ to $1\frac{1}{10}$ inches. The females average much larger than the males. The palpi of the females form a prominent "beak." The palpi of the male are not so conspicuous. The adults fly normally after dusk, about May for the first brood, and August for the second brood. When the moth is at rest the legs are naturally concealed. The wings closely overlap on the back, when folded, and are drawn down at the sides. The outer margin, thus folded, suggests the outline of the tail of a fowl.

When the moth is disturbed it moves with a jump and a flit, making it hard to catch. The eggs are inserted by the telescoping ovipositor into any available crevice of the hive, the number sometimes exceeding 200.

The adult moths are very agile, their speed of flight exceeding the flight of bees.

The bee-killer, or wolf-fly (*Promachus bastardi*) was first reported from Nebraska in July, 1864, as a pronounced enemy of the honey-bee. Dr. Fitch describes these flies as inhuman murderers—the savages of the insect world. They take their prey to some extent, perhaps generally, on the wing, and even seize dragon-flies, bumble-bees, and tiger-beetles. The pain of a common horse-fly's bite is generally understood to be maddening in its sharpness; but the wolf-fly proboscis lacks all softness, and when inserted into the victim it is held there by stiff bristles, and the fly sucks out, not a little blood, but the whole mass of the internal organs! Dr. Riley watched a number of these bee-killers for a while, and observed that, although many other insects were present, it gave exclusive attention during this observation to the selection of honey-bees. The sting of the bee seems not to affect them except to make them tighten their grasp on their doomed victims. The bee-killer is in the adult stage during June and July.

The bee-louse is found living parasitically on the honey-bees in Europe. It is from $\frac{1}{4}$ to $\frac{3}{8}$ of a line long. It is a body parasite, one or two occurring on the body of the bee, though sometimes they greatly multiply, and are very troublesome to the bees.

The blister-beetle (*Meloe Americanus*) seems to be the only member of its family in Pennsylvania. Its life history is varied from that of most insects, even from other coleoptera, in having, instead of egg, larval, pupa, and adult stage, larval (the breeding stage), the second larval, the third larval stage, pupa, and adult. This insect hatches from the eggs, which are laid in the ground, and gets a foothold on a bee at the first opportunity. These are body parasites. Lack of time prevented Mr. Sattlewait from dealing with other insect enemies of bees such as wasps, hornets, millipedes, and spiders.

The remedy was, to keep the colony strong, and the bees will usually be their own best protectors, thousands of bees being ready to die in the defense of their home.

MR. FRANCE REMEMBERED.

This was followed by the question-box, which, for lack of space we will not here reproduce. But there was one very pretty incident that occurred, during which Mr. W. Z. Hutchinson sprang a pleasant surprise. The session was about to adjourn when he begged a few moments of time in which he might bring up a matter that he thought would be interesting to all. He then proceeded to tell how he had sent out a circular letter to the members of the National Beekeepers' Association in which he called attention to the splendid services performed by General Manager N. E. France to the National, and how he had worked long and faithfully, as every one knew, for a very small salary. He suggested that those who felt that the General Manager's services were worthy of a lasting recognition, and who would be willing to contribute a small amount

toward the purchase of a gold watch and chain, to be presented at the Harrisburg convention, should send in their contributions. There were many responses to this, the majority of remittances being in ten-cent pieces; but there were quite a number of others, ranging all the way from two to five dollars each, the aggregate of which was \$75.00. But the most pleasing feature, said Mr. Hutchinson, in these responses was that many said they had thought of doing the same thing before, and were now glad of sending this mark of their appreciation. One man in particular had thought for some time that Mr. France should be kept under a close "watch," and added that he should not wonder if he needed to be "chained" too, and inclosed his 25 cents. To make a long story short, Mr. Hutchinson, with the money, purchased a beautiful gold watch with a full-jeweled movement, bearing the following inscription: "A token of appreciation from members of the N. B. K. A. to their manager, N. E. France;" and as he presented this to Mr. France he said:

Bro. France, take this beautiful token of our appreciation; wear it next your heart; and may that heart long beat as faithfully and steadily as the little balance-wheel inside; may your face ever be as bright and shining as this beautiful case; and may your days be as full of "good works."

But there was money enough left to make another present, and a happy thought struck Mr. Hutchinson that the wife who had made it possible for Mr. France to leave home and attend to the exacting duties of the National ought to be remembered; and after tendering the watch Mr. Hutchinson turned again to the General Manager and said:

Bro. France, we have tried to fill your cup of happiness to the brim; now we wish to make it *overflow*. Away in that far western home of yours is a loved one who, with bright brain and nimble fingers, looks well to the ways of her household. And we have been led to believe that, were it not for these nimble fingers and the wise guidance of affairs in your absence, it would be impossible for you to fulfill properly the duties of the office that you now hold. In view of this we esteem it a rare pleasure to remember also that faithful helpmate of yours—your wife. We have, for her, a dozen solid-silver tea-spoons. On the top of the handle, in old English script, we have had engraved the letter F. On the under side of the handle, in smaller script, are the letters N. B. K. A. Take them to Mrs. France, and present them with the compliments of the National Association. Tell her not to "keep them just for company." Have her use them every day, just as you do your watch, and when your hand supports one of these so easily, so lightly, remember that, in a like manner, back of you stands the whole National Association, and that it can and *will* support you just as firmly as your hand can support one of these little spoons.

At the conclusion of this Mr. France was deeply touched, and for the time being was unable to respond. The day's session adjourned, after which he was made the recipient of many hearty handshakes and congratulations.

GLEANINGS believes that the wonderful growth and success of the National has been due very largely to Mr. France's personality; but, more than all else, to the immense amount of hard work which he has bestowed on the organization—a service, which Mr. Hutchinson very properly estimates, could not have been secured by any private corporation for five times the amount he has been paid. (Continued.)

HONEY FROM BASSWOOD.

"I am sending you a few questions which I wish you to answer as they are numbered, if you will accommodate me thus; and I wish them answered through the columns of GLEANINGS. 1. I am thinking of moving my bees, the coming summer, several miles to where there is an abundance of basswood, hoping to secure a greater yield of honey than I at present receive, as I have no basswood near me. What would be your opinion regarding this matter? 2. Are there any seasons when basswood blossoms in profusion without giving a good yield of nectar from those blossoms? 3. Are not the blossom-buds formed on the basswood-trees a few weeks previous to the time of their opening, so that I can know by this whether there is a prospect of honey from that source in time to make preparations for moving? Thanking you in advance for whatever reply you may see fit to make, I am

"Yours truly,
"T. E. Howe, New York."

In answering the first question I would say that I believe basswood to be the greatest honey-producer in the world, and the least likely to fail to yield nectar of any plant or tree; therefore I call the idea of our correspondent a good one, and I see nothing against it except the expense. That basswood is an enormous yielder of nectar was proven years ago, when the late Dr. Gallup, then of Orchard, Iowa, obtained a yield of 20 pounds per day on an average from a single colony, during a period of 30 days; or 600 pounds from a single colony in thirty days. This record has never been beaten, if I am correct, by any single colony, from any one source of nectar supply during the same number of days. I once had a colony which gave a yield of 66 lbs. of basswood honey in three days, and 302 in ten days, and probably might have done nearly as well as Gallup's had the flow of nectar continued as long. From the above I believe if Mr. Howe can move his bees to the basswood and return them at an expense of about one dollar per colony, he would do well, even in a rather poor season, as a yield of ten pounds per colony would nearly if not quite pay for the moving. And should the cost come up to \$1.50 per colony, 15 to 17 pounds would cover that with the present price of honey.

By going back over my account with my bees for the past 30 years I find that, from basswood alone, my yield of honey has been about 55 pounds on an average from each colony, each year. This is the average yield of the apiary, not the yield of an individual

colony. Now, to be on the safe side, suppose we call 50 pounds as the average yield, or what we could expect one year with another, from basswood, and that it will cost 20 pounds of that yield for moving the bees to the basswood, we shall have 30 lbs. per colony left as the profit. This, at 10 cts. per pound, would give us \$3 00 per colony; and if Mr. Howe has 100 colonies his profit above the cost would be \$300 00, which would be an item worth considering.

To his second question, I will say that, up to five years ago, I never knew of an entire failure of nectar from the basswood. That season we had a freeze which formed ice half an inch thick after the basswood commenced to leave out, and for this reason there was not any basswood bloom at all that year, hence an entire failure; then three years ago a freeze killed all the buds on the low ground, but on the hills there was some bloom, but not enough to give any thing like a full yield. Aside from this the shortest flow I ever knew gave a three-days' yield, in which honey was so plentiful that the bees could not prepare room fast enough to store it, with a gradual tapering off of two days more, making five days in all. The longest gave a yield of 25 days, with three of them so cold that the bees could work only a little in the middle of the day. The state of the atmosphere has much to do with the secretion of nectar in the basswood flowers. The most unfavorable weather is a cold, rainy, cloudy spell, with the air or wind in a northerly direction. If basswood bloom came at a time of year when we were likely to have much such weather, there might be some doubt about moving to the basswood being profitable; but, as a rule, we have very little such weather while basswood is in bloom. We are more apt to have showery weather with the air charged with electricity, at which time the nectar will almost drop from the blossoms, providing no rain comes within two or three miles from the apiary. At such times as this I have seen honey sparkling in the bloom after it had fallen to the ground—so much so as to attract my attention in the morning sunshine. Then this nectar is almost or quite honey, not sweetened water, which makes basswood doubly valuable over most of other honey-secreting plants or trees. At times when basswood was yielding its best I have seen fully a bee-load of honey in a single flower, and from one stem of blossoms I have jarred two to three thick drops of nectar into the palm of my hand, enough so it would run from the hand. But, of course, such an extreme has occurred only three or four times in my forty years of apicultural life.

In answering the third question I will say that the fruit-buds and leaflets to all trees with which I am familiar are formed in June and July of the preceding year, so the results of next season's honey yield, so far as buds and flowers are concerned, are already formed in embryo, on the apparently bare and lifeless branches of the basswood-trees, as we behold them these zero days of winter. They

wait only for the warmth of spring, to bring this dormant life into growth. As soon as these buds unfold some time during the coming May, then we can see and know whether to make preparations for moving the bees or not. By examining closely we can find the bunch of buds at the base of each leaf, curled up, looking like the half of a small sweet-pea seed, or perhaps a little fuzzy caterpillar would describe it better. With each week the bunch of buds grows till at the end of about seven weeks from the time the trees begin to show their green in spring they open their flowers filled with nectar, to invite the bees to a sumptuous feast. Of course, a cool season will retard the time of bloom from a week to ten days, and a very hot season advance it nearly as much, but the above is the rule. June 28th is the earliest I ever knew basswood bloom to open in this locality, and July 16th the latest. Thus the practical eye can tell nearly two months in advance as to the promise of a yield of basswood honey.

SELECTING QUEENS.

I read with great interest the article in Nov. 1st issue GLEANINGS from E. W. Alexander, as I always do words from his pen. Two points interested me particularly, as my own experience is strictly in line with his. One of the greatest inventions ever made in this country, or, for that matter, in the world, was the Babcock milk-tester. This simple instrument makes it possible for the dairyman to know just what each cow brings him. He need not leave any thing to chance, but can tell easily, at once, and with no chance for mistake, the exact status of every one of his cows. This makes it possible to weed out the failures, and also the indifferent animals, and soon he has only the best; and as he breeds from those retained, he reaps a double benefit; he has cows that pay, and he gets a renewal in kind for future use. It is said that this simple invention of Prof. Babcock, of the Wisconsin University, which was given to the world, increased the dairy products and profits by one-half in Wisconsin; and if there, then of course it has done equal service in every other State where the dairy interest is prominent.

Mr. Alexander's article suggests that the dairyman is not the only one who practices this weeding-out process. The bee-keeper has no Babcock machine, but he is less in need of one than is the dairyman; for if he has sharp eyes (and these are quite requisite to the successful bee-keeper) he will know his queens from alpha to omega, and will know

the one that fills his hives with industry, honey, and his pocketbook with dollars. But, even with this knowledge, how many practice the keeping of only the best, and breeding from only the *very* best? Here the apiarist has advantage over even the dairyman, for the dairyman will, with a great show of reason, hesitate to kill any of his calves from selected mothers, while the bee-keeper has no good reason for breeding from any one but the very best queen of the apiary. The dairyman can get but one offspring from each cow in a year, while the bee-man can get all his queens from his best queen—an unlimited number; and if he exercises the requisite care, he can get them nearly all mated with drones from his next-best queen. Should not all then follow the advice and example of Mr. Alexander, taking every pains to determine the very best queens, those that breed late in fall, those that are phenomenally prolific, those that give us sweet-tempered workers, and, indeed, workers that are models in every respect? Then let us be unsparing, and mercilessly destroy every one that does not come up to the best, and re-queen from young queens that are reared from the very best queen in the bee-yard. If others have better—they will not have if we practice the above—then we will, if wise, secure from them, that we may breed and possess the very best that are to be had.

Peter Collyer once said that it would be a God-send if lightning would strike half the cows in the State of New York if it would select discreetly. Mr. Wm McEvoy says in the October number of the *Canadian Bee Journal*, that 90 per cent of the queens of Ontario should be destroyed, and young better queens put in their place. We have no reason to think that Ontario is one whit behind any section of the world in the skill and intelligence of her bee-keepers.

The second point made by Mr. Alexander is just as wise and timely as the other. Years ago, as readers of the bee-journals will remember, I tried the effects of stimulative feeding in the spring, and with surprising results. There is no question but judicious feeding, regularly carried on, will do wonders as the colonies are building up in the spring. Mr. Alexander makes another good point which has so much of his customary good sense coupled with it that it must commend itself to every thoughtful experienced bee-keeper. The solid combs of capped honey in the middle of the brood-nest are sure in the way of a prosperous increase. Some one has said that dirt is matter out of place, and, if so, a very short word characterizes the keeping of great frames solid with honey in the brood-chamber in the early season of the year.

There are three decided gains in the recommendation of Mr. Alexander, faithfully carried out: First and least, we often get honey to sell that would otherwise be worse than useless, for a time; second, we remove the great cold barriers in the midst of the brood-nest, that would better be in cellar or storeroom, or, better still, extracted, the hon-

ey sold, and the combs ready for use as needed in the spring; and third, and most important, we would practice that stimulation which would give us very strong colonies and much honey as the season advances. I am sure we all owe Mr. Alexander a most hearty vote of thanks for his meaty article, and you, Mr. Editor, for giving it to us in the pages of your excellent paper.

ENEMIES OF BEES.

One of the interesting facts of nature is that of mimicry for protection. In one case our bees are victims to this law of mimicry. This comes through one of our little bugs, which, in my "Bee-keeper's Guide," I call the "stinging bug." This insect is known to science as *Phymata erosa*. This little bug is a good illustration of this law of mimicry. It is of a dull obscure yellow; and as it hides among the stamens of the goldenrod it is so concealed that it is difficult even for the human eye, sharpened by close scientific observation, to discover it. What wonder, then, that the industrious honey-bee, all unsuspecting, should come fearlessly into the very clutch of this cruel stinging bug? I gave the name "stinging bug" to this little stabber, as it often punctures man himself so as to cause a severe smart.

There is another curious feature about this little murderer that is not specially joyous to the bee-keeper. It has its front legs curiously fashioned so as to grasp with them; and as it lies snugly in its floral retreat it can, as bee or other coveted insect comes to it, grasp its luckless prey with one of these strong leg jaws, and, with the other, hold firmly to the flower, and then with its strong beak can pierce and suck its victim bloodless and lifeless. This phymata is widely distributed in our country, and destroys many thousands of bees annually. It is fortunate that our bees are so prolific, as we know of no way to get rid of these bugs, and we may not suffer very serious loss, for the increase in the hive with a good queen is so striking that the loss from the stinging bug is not greatly felt.

On page 1510 you very wisely endorse what appears to be to you a new idea in comb-honey shipping-cases; viz., a sliding cover. No doubt the idea is original with Mr. Hart, but we have had them in general use in Ontario for fifteen years or more. I simply took the pattern from the old-fashioned wooden match-box.

STIMULATIVE FEEDING IN SPRING.

At the Ontario Bee-keepers' Association convention lately held in Toronto, Messrs. Wm. McEvoy, S. D. House, E. Deckinson, Jr., and R. F. Holtermann were about the only pronounced advocates of stimulative feeding. They carefully qualified the statement by saying it had to be done skillfully and judiciously, and Mr. McEvoy said that, when begun at fruit-bloom time, feeding should be done whenever one day passed without either natural or artificial storing by the bees. For my part I am inclined to think that the four above-named gentlemen displayed remarkably sound judgment in their views and convictions upon the question.

BRANT DISTRICT MEETING.

The Brant District bee-keepers' convention, which has been so great a success for several years, and which last year was honored by the presence of five (and no ordinary five) of our United States bee-keeping fraternity, is to be held this year at Brantford, Jan. 21, 22, 23, beginning at 7:30 P.M. of the first day, probably at the court-house. Mr. L. A. Aspinwall, President National Bee-keepers' Association, Jackson, Mich., has already signified his intention to be present with a non-swarming hive. As old and careful an investigator as is Mr. Aspinwall would be enough of a drawing card; but we expect many more. My bee-cellar will be open for inspection. I should be glad if those coming from the United States or Canada would write the secretary, Mr. W. J. Craig, Brantford, or myself at the same place. New York State is only some 80 miles away, and Michigan is within a reasonable distance.

PLACING BEES EARLIER IN THE CELLAR.

On Nov. 18, Mr. C. Edmansson, President of the Brant Bee-keepers' Association, a thoroughly up-to-date bee-keeper, helped me to put my bees in the cellar. On the 27th of the same month I helped him to cellar his bees. We both made up our minds that the bees had lost by remaining out the other nine days, and, circumstances permitting, the bees will go in even earlier next year.

FOUL BROOD.

No doubt all will be pleased that, when the reports of the latter part of the season and that of the extreme eastern portion of the Province have been added to the early seasons, the percentage of apiaries found diseased of those inspected is 42. This, however, leaves no room for congratulation, particularly when, in some cases, every apiary in the vicinity was inspected. As the result of attending conventions in New York and Michigan I found much disease reported in the Michigan Convention, where, it was said, "We must wipe it out or it will wipe us out." In other diseases of a contagious nature a good wholesome anxiety aroused makes every intelligent person help in the needed work. It appears to me that the bee-journals could and should help in this work. Let every bee-keeper in the country work to see if the dis-

ease is in his and his neighbors' apiaries, and this, with the law in cases needed, will do much to stamp out the disease.

HONEY FOR ROYALTY.

So King Edward, of Great Britain and Ireland, is to be presented with Canadian comb and extracted honey. It is the product of the Province of Ontario, and it was shown at the fruit, flower, and honey show, Toronto. Messrs. D. Anguish, Geo. Laing, H. G. Sibbald, E. Grainger, and J. H. Thomson, certainly had very fine honey there, and I feel sure that, with His Majesty's usual good judgment, the Ontario Bee-keepers' Association (for it presents the goods) will in future be "Purveyors to His Majesty." His peaceful tendencies are already well known; but we expect that, after partaking of this honey, his Majesty's tendencies in that direction will become so active, and his good will to the bee-keeping industry in Ontario will become so great, that he will be instrumental, or at least seek to be instrumental, in calling a truce, or even declare a peace between *Bacillus alvei* and the larvae of *Apis mellifica*; also between whatever factions or differences of opinion there may be in the bee-keeping world.

CARBON DIOXIDE IN WINTERING.

In the *British Medical Journal* of Dec. 22, 1906, appears an interesting article on "Acapnia as a Factor in Shock." The article is by Dr. Henderson, and it may have a very interesting bearing upon the wintering problem. It is just such problems as these, and the impossibility of their accurate solution otherwise, that makes us long for the time when we shall have thoroughly practical yet scientific experiments in charge of apicultural experimental stations equipped for the most delicate of tests and closest observations and the recording of the results. Briefly Dr. Henderson states that it is found that, in the fetus of animals, there is found in their blood a higher percentage of carbon dioxide than in the mature animal; that in breathing our lungs are not entirely emptied of gas, and that, when we draw in fresh air, owing to the admixture of this with the carbon-dioxide-laden air there is a dilution.

This admixture of carbon dioxide and air has a purpose, as has every act in nature. He found that, when we draw sharp quick breaths for several times in succession the carbon dioxide in the lungs is diluted, and, after such action, we naturally want to stop, or at least we much want to curtail breathing for a time. The object thus accomplished by nature is to increase again to normal the percentage of carbon dioxide in the lungs. Dr. Henderson, by careful tests, found that by increasing the amount of oxygen in the lungs, the palpitation of the heart increased, and the amount of blood driven through the veins was affected, and that this may become injurious; in fact, in extreme cases it caused death.

But some may say this is very interesting,

and may even explain to those whose heart-action is weak why they should not exercise violently; but what has that to do with bee-keeping?

Why, I can see that it may be possible that, when bees are at rest, especially during the quiet of winter, it may be a positive advantage for the atmosphere to be diluted with carbon dioxide, that the lack of ventilation, except in a very moderate way, may be injurious, providing the moisture, by means of environments, or the construction of the hive, or can be taken away from the bees. What interesting problems in bee-keeping, problems that we have not yet dreamed of, may we not solve in the future?

HONEY GINGER-BREAD.

Simmer one pound of honey; mix in one pound of rye flour or wheat flour. Stir with a wooden spoon. Beat it well and then allow it to get cold. Add to the batter (dough) half an ounce of carbonate of ammonia, which may be obtained at any drugstore. Thoroughly incorporate the carbonate of ammonia, for on this the proper rising of the bread depends. It should be cooked slowly in the oven. This is said to produce excellent bread, and yet is very easy to make. —*Health and Honey (French)*.

BEE-KEEPING FOSTERED BY THE NEW ZEALAND DEPARTMENT OF AGRICULTURE.

The New Zealand Department of Agriculture has just sent us a copy of a recent bulletin on bee culture which it is now distributing to the bee-keepers of that far-away country. As usual, it is well gotten up, and its teachings are sound and good. Its author is an old-time friend of GLEANINGS, Mr. Isaac Hopkins, who is now government apiarist. The bulletin is mainly written in the interest of beginners and amateurs, and, so far as we know about New Zealand apiculture, the instruction given is excellent.

A NEW WORK ON THE NATURAL HISTORY OF THE HONEY-BEE.

The publishers of the *Illustrierte Monatsblätter fuer Bienenzucht*, published at Klosterneuburg, near Vienna, have sent us a copy of part first of their new book "Contributions to a Natural History of the Honey-bee," by Dr. Fleischman, Professor of Zoology in the University of Erlangen. The editor is the well-known Theodor Weippl, himself quite an author, and also editor of

the Austrian bee-journal from the office of which this book is published. The book is somewhat on the style of Mr. Cowan's, but goes over more ground, and goes deeper into the subject. One of the features of this work are the illustrations drawn by Dr. Fleischman himself. There are nearly sixty in this part alone, which deals with the hair, legs, wings, mouth-parts, and various parts of the body. The cell theory as applied to honey-bees is graphically displayed so as to be readily understood. It will be some time before all the parts are out, as it is being issued from time to time. To those who understand the German language thoroughly, we can highly recommend this book. Each part costs 25 cents; but any one wishing to obtain copies must subscribe for the whole book, which, we understand, will consist of six parts.

THE HONEY-BEARING TREES OF WEST AUSTRALIA; THE EUCALYPTUS.

Mr. John Craigie has kindly furnished me with a list of the principal honey-bearing trees of West Australia, which may be considered a model, and hence it is appended here. It will be noted that the common names of the eucalypti differ in some cases from those in other parts of Australia.

MYRTACEÆ.	SYSTEMATIC NAME.	VERNACULAR N ^o .
Myrtacæ.	Eucalyptus Calophylla.	Red gum.
Myrtacæ.	Eucalyptus Marginata.	Jarrah.—
Myrtacæ.	Eucalyptus Toxophylla.	York gum.
Myrtacæ.	Eucalyptus Redunca.	Wandoo.
Myrtacæ.	Eucalyptus Gomphocephala.	Tuart.
Myrtacæ.	Eucalyptus Patens.	Blackbutt.
Myrtacæ.	Eucalyptus Rostrata.	Flooded gum.
Myrtacæ.	Eucalyptus Rudis.	Flooded gum.
Myrtacæ.	Eucalyptus Megacarpa.	Blue gum.
Myrtacæ.	Eucalyptus Agonis Flexuosa.	Peppermint-tree.
Myrtacæ.	E. Melaleuca Leucadendron.	Paper-bark.
Proteaceæ.	Banksia Verticillata.	River Banksia.
Proteaceæ.	Banksia Littoralis.	Seaside Banksia.
Proteaceæ.	Banksia Attenuata.	Narrow-leaf Ban'a.
Proteaceæ.	Banksia Menziesii.	Menzies Banksia.
Proteaceæ.	Banksia Illiciifolia.	Hollyleaf Banksia.
Proteaceæ.	Banksia Grandis.	Great flowering B.
Proteaceæ.	Banksia Dentata.	Toothed Banksia.
Leguminosæ.	Acacia Saligna.	Wattle bark.
Leguminosæ.	Acacia Acuminata.	Raspberry jam.
Leguminosæ.	Acacia Microbotrya.	Wattle gum.
Læcinthaceæ.	Nuytsia Floribunda.	Christmas-tree.

For good or ill, the eucalyptus-trees are being extensively planted on the Pacific slope, and the more we know about them the better. It is pretty certain that, in many cases, the wrong species has been planted, and an error of this kind is difficult to rectify. For example, the blue gum of Tasmania (*Eucalyptus globulus*) has been quite extensively planted, whereas it is much inferior to some others for the same purpose. Curiously enough, California has great virgin forests of fine redwood and pine trees, and yet it is planting eucalypti by the millions.

THE HONEY FLORA OF SPAIN.

Señor Miguel Pons-Fabregues, of Barcelona, Spain, has sent me a copy of his "Apicultural Flora of Spain," a book of nearly 200 pages. As indicated by its name it deals with the honey-plants of Spain, or, rather, the Iberian peninsula. It enumerates 652 species of plants which the bees frequent.

Of course, these are not all natives, some being exotics; but the fact that some parts of Spain are very cold, while other parts are quite tropical, growing oranges, lemons, dates, etc., accounts for the long list. Señor Pons-Fabregues has made quite a study of the bee flora of Spain, and has succeeded in compiling a very interesting list.

Some of the plants he mentions might with great propriety be introduced into the United States; for example, chick-peas, sulla, esparcette, lentils, St. John's bread, and fenu-greek, all belonging to the order of legumes. In Spain these plants have been regularly cultivated for hundreds of years.

This Spanish writer regards the "sweet clover," or "Bokara clover," of this country, as a sub-species or variety of *Melotus alba*, which he terms *Melotus leucantha*. He mentions, also, *Melotus parviflora*, *M. neapolitana*, *M. macrorrhiza*, and *M. arvensis*. He does not mention the dark-blue or purple sweet clover.

He mentions the hardy yellow alfalfa (*Medicago lupulina*). He says it sometimes bears violet flowers. He also states there are many other species of *Medicago* in Spain.

THE DANDELION IN SPAIN.

In regard to the much maligned dandelion he rightly remarks that it is an excellent salad plant, and that it is an excellent forage plant for cattle. It may interest many to know that heather grows well on the mountain tablelands of old Spain. He quietly remarks, however, that, while the quantity of the honey obtained from it is very great, the quality is inferior. If he ever goes to Germany or Scotland he stands a chance of being lynched.

He mentions the olive-tree as a honey-plant, in deference, probably, to the opinion of some other bee-keepers who have reported it as such. He seems inclined to doubt it. I have observed olives for years, and, so far, have yet to see a bee near its flowers. Possibly it yields honey-dew. He mentions the grape in his list, for the reason that, after other insects have bitten open the skin, the bees manage to get a quantity of sweet nectar therefrom. Altogether the book is a very creditable production, more particularly as it emanates from a country which some are inclined to regard as behind the age. It is very well printed on good paper, and sells for 50 cents.

BEE-KEEPING IN SPAIN; A COMPARISON OF PRICES ON HONEY IN THE VARIOUS EUROPEAN COUNTRIES, FROM EL COLMENERO ESPAÑOL.

On various occasions we have shown how abundantly blessed is our native country with appropriate conditions for successful apiculture—a benign climate, and a rich and abundant flora rendering it possible to se-

cure yields which may seem impossible to those who do not follow the movable system of bee-keeping. Modern apiculturists who devote study and knowledge to effect a complete understanding of the problems surrounding the collection of honey are just as anxious to secure a price for their honey from merchants equal to its actual value, or the system in which it is held, and according to the class to which it belongs. In this part of Spain it is somewhat difficult to realize on our honey for want of a depot or honey-selling agency.

Our honey, especially that proceeding from orange-flowers, in the kingdom of Valencia, Murcia, and Andalusia, also that from the rosemary, is always appreciated, as also that gathered from the flowers of the wild thyme, and other mint flowers having an exquisite aroma, and which are proper to the Mediterranean region and the coast of Spain. These have to come in competition with honey derived from clover, sainfoin, alfalfa, rape, and other kinds of various origins, which are more abundant in outside regions, but which we are certain are not superior to our Spanish honeys. We propose, then, to compare the prices obtained in other countries with those in our own, as a guide to our bee-keepers.

Berlin.—The price of extracted honey there is always firm enough; $\frac{1}{2}$ kilo (a little more than 1 lb.) extracted honey, 30 cts.; $\frac{3}{4}$ kilo (a pound section) comb honey, 37 $\frac{1}{2}$ cts.; 1 kilo (2 $\frac{1}{2}$ lbs.), 59 cts.

Bremen.—Honey (in sections) per lb., 30 cts.; honey (extracted) per lb., 27 $\frac{1}{2}$ cts.; honey (strained), per lb., 20 cts.

At Reichenberg, Bohemia, Austria, the price of honey in the market is approximately as follows: $\frac{1}{2}$ lb., 20 cts.; 1 lb., 36 cts.; 1 $\frac{1}{2}$ lbs., 56 cts.; 2 $\frac{1}{2}$ lbs., \$1.00.

It should be understood this is for honey which is new, and put up in a jar.

Germany.—Already we have quoted the prices obtained for honey in the capital city of the nation, giving the figures obtained at the end of last October. These prices make a very suggestive comparison when put alongside the prices obtained for Spanish honey, and it is certain the quality is in no wise superior to ours. The sale of honey at these prices is very considerable, and may be indicated as never under 30 cents nor over 37 $\frac{1}{2}$ per lb. (17 oz.). It is understood, of course, the honey is in glass. For basswood, locust, and similar kinds, which are considered very good, but which are certainly not superior to orange blossom or wild thyme, a price of 50 cts. per lb. is obtained.

In Denmark the best honey is sold by the producer directly to the consumer, and the average price obtained is in the vicinity of 28 cts. per lb. in the bottle.

In France the course of prices for honey in Paris is almost stationary, and for light-colored high-class honey the stores never seem to have enough.

In Switzerland the honey is generally very good, and as much as 60 cts. per lb. (in jars) is often paid for it.

Now we have some sort of data on which to base the future production and sale of honey in Spain, with respect to the chances of exporting our honey to foreign countries, more particularly as we have noted the large importations of honey from South America into Hamburg, Germany, which would indicate there is always a remunerative sale for good honey elsewhere.

But, on the other hand, here in Spain all kinds of good honey which can be guaranteed as the pure nectar of the flowers, and which the intelligent buyer knows to have been extracted by centrifugal force, and produced by the movable-frame system, can generally be sold with facility. In addition to this there is this about this system, and it is a very important feature, that, provided there is no other bee-keeper in your locality, it is quite possible to secure from an apiary 25,000 lbs. of honey—a superb result.

It is important that much study be devoted to apiculture, for our country is lamentably deficient in this respect, and clings to the old-fashioned plan. Our present limited production is simply due to superior natural advantages only. Our system of production is faulty, and so also is our system of selling to foreign countries, for the superior quality of our honey ought to insure for it a ready sale in foreign markets. In our November number it may have been noticed that, through the medium of the government and the department of agriculture, it had been officially determined that apiculture would receive more attention in future from the Grand Institute of Agriculture, and also in the schools of practical agriculture, so that the true system of apiculture, theoretical and practical, will be taught.

PEDRO VILLUENDAS HERRERO.

A BELGIAN BEE-KEEPERS' SOCIETY AND ITS DOINGS.

One of the most active and energetic bee-keepers' society in all Europe is that of Bourg-Leopold, in Belgium. During the season just passed it held a number of meetings which, in some cases, were held at the apiaries of members. For the year 1908 the committee of management have decided on a program that, to say the least, is praiseworthy.

1. To change the race of bees in the country, and to substitute Americans, Italians, and their crosses.

2. As far as practical, to increase the bee pasturage.

3. To maintain hives on scales so the value of the various localities for bees may be determined with certainty.

4. Official participation in all bee-exhibitions, agricultural fairs, food expositions, etc., with the view of popularizing the honey of the Campine.

5. To maintain a committee whose business shall be to promote the sale of honey belonging to members.

6. To study the bee flora of the Campine and to propagate plants which yield honey.

7. To gather a collection of home and foreign honey.

8. To study every thing bearing on the improvement of the industry.

The first item ought to interest the Germans just over the border, for they have severely condemned our American bees. Was it prejudice?

LATE FALL FEEDING.

Its Advantages; How 200 Colonies were Fed a Sufficient Amount of Warm Syrup to Last them Through the Winter; Why Sugar Syrup Should be Substituted for Honey.

BY E. W. ALEXANDER.

It is only a few years since the necessity of feeding bees in the fall was looked upon as the result of inexcusable negligence in the management. But time and experience are changing many methods, and we are fast learning that bee-keeping to-day is a very different business from that of years ago.

Last winter, while visiting one of the most extensive honey-producers of New York, he told me that he and his father had for several years fed every one of the 1500 or 2000 colonies they had, just before putting them away for winter. They gave each one about 20 lbs. of sugar syrup without regard to the amount of honey the hives contained. This syrup was made from granulated sugar in the proportion of 2 lbs. of sugar to 1 of water. This was boiled until well dissolved, when about $\frac{1}{4}$ lb. of tartaric acid was added to every 100 lbs. of sugar. From their extensive experience in feeding tons of sugar to thousands of colonies they told me it was a much safer and a better winter food than any honey their bees had ever gathered.

The principal fault with all honey that I am acquainted with, except basswood, is that it contains some pollen that is carried into the honey-cups of the flowers by the wind or by insects, and then it is taken out with the nectar and becomes mixed with the honey, where it has a very injurious effect on the bees during the winter. This pollen is very noticeable in our large honey-tanks when they are nearly full of extracted honey, as it rises to the top, forming a scum sometimes two inches thick. This, when mixed with the winter stores, is quite likely to cause dysentery before the bees are taken from their winter quarters in the spring.

Now, with sugar syrup, since there is no

foreign substance it is practically all digested, and the bees come from their winter quarters dry and clean, leaving no marks on the snow or their hives after their long confinement. This one advantage derived from sugar syrup, of itself alone, would far more than pay for the trouble of late fall feeding.

But there is another advantage gained by substituting sugar syrup in the place of honey. If it requires about 20 lbs. of honey to winter a colony, this additional surplus would be worth at wholesale about \$1.50. Now, in its place, if we use 14 lbs. of sugar to make about 21 lbs. of very thick syrup, costing about 75 cents, or half the amount the honey will bring, there is a saving of over \$400 in an apiary of 600 colonies. Besides the bees are given a much safer and better winter food.

We have been so well pleased with our experience along this line, and the experience of these noted bee-keepers, that we are now wintering some 200 colonies almost wholly on sugar syrup.

As many readers of GLEANINGS would like to know how we feed such a large amount of syrup in cool weather I will briefly state how it was done.

The first important part is a convenient feeder, one that will hold at one time all the feed necessary for one colony. This we made by taking 50 of our outside telescope caps, having a rim 2 inches deep all around. The inside of these we gave a good coating of hot paraffine wax, which prevents the syrup from penetrating into the wood, and also stops leaking. These caps are $\frac{1}{4}$ inch larger each way inside than the hive is outside.

We put in a suitable float to prevent the bees from drowning in the warm syrup, and also put two cleats across inside the feeder for the hive to rest on; then about sundown we took these 50 cap feeders and set one properly leveled up near each hive we wanted to feed. With the syrup as hot as the bees could stand we poured into the feeder the amount we thought the colony required, then, carefully lifting the hive from its bottom-board, we set it inside the feeder directly over the warm syrup, and the job was done. The bees at once went down into the feeder and removed all the syrup long before morning; so the next day all we had to do was to set the hives back on their bottom-boards and place the 50 feeders ready to feed 50 more colonies the following night. After we had the syrup ready it required only about half an hour for my son and myself to feed 50 colonies. In four evenings, between sundown and dark, we had the 200 colonies all fed, and not a spoonful of syrup was wasted nor a handful of bees lost.

This feeding was done on quite cold frosty nights about Oct. 25.

Now, if we were feeding in early fall for the purpose of brood-rearing it would be necessary to feed much thinner syrup, and only two or three pounds a day, about the same as we would feed in the spring in order to stimulate brood-rearing.

DR. BIGELOW GIVING A DEMONSTRATION BEFORE A CLASS OF TEACHERS FROM THE SUMMER SCHOOL AT BUTLER UNIVERSITY, INDIANA.—SEE PAGE 34.

Dr. Bigelow, the nature-study man, in the middle foreground, is the one who, two years ago, brought to the home apiary of the publishers a large company of schoolteachers to study bees and their methods of management. Our older subscribers will recall half-tones on these pages showing how at this time he not only tamed the bees but the schoolma'ns as well. In the picture he has again demonstrated his ability to bring together in perfect harmony the honey-makers and the honey-eaters. He has done much to introduce bee culture as a department of nature-study in our public schools, and in a general way to popularize honey.—Ed.

Every year's experience convinces me more and more of the importance of feeding our bees at certain times of the year. We as honey-producers have sadly neglected this important part of our business.

There are many of us who neglect to do certain things both useful and necessary for the welfare of ourselves and bees, simply because we have no convenient and quick way to do the work. In feeding these 200 colonies I have just mentioned, if we had been obliged to feed them in our small spring feeders holding only about 2 lbs. each, we should have had an elephant on our hands; and the feeding, if done at all, would have required two weeks or more, as the bees would hardly have entered a small feeder so late in the season.

The principal advantage in late fall feeding is to have the bees store the syrup in and around the cluster where they have removed the honey during the last of their breeding in the fall; then this is first consumed by the bees during the winter; and by the time they commence to use their honey they are out of the cellar, and can frequently fly; so if their honey contains pollen, or is otherwise of poor quality, it can do them no harm.

I think the time is near at hand when the successful honey-producer will substitute sugar syrup for honey as a winter food wherever bees require a cellar for winter protection. In order to compete successfully with many that are now well established in the production of honey, it is necessary for us to be ever ready to take advantage of any thing that will add to our income, even though it may require the investing of some money at first.

We must certainly sow before we can expect to reap. This applies as truly to bee-keeping as to any other line of business.

Delanson, N. Y., Dec. 6.

[It is the usual rule nowadays to feed sugar syrup early in the fall before cold weather sets in, making the proportions half sugar and half water, either by weight or by measure. While this does not make a syrup by any means as thin as nectar, yet a thin syrup the bees will invert better than a thick one; that is to say, they partially digest it, making it more suitable for a food. Such a syrup, when evaporated in the hive, will never granulate or revert back to sugar; nor is it ever necessary to use any acid to prevent such granulation. But in feeding late in the fall, after cool or cold weather has set in, it is necessary to feed as our correspondent advises, with a syrup two parts of sugar and one part of water, and perhaps it may be advisable to use an acid.]

There is an advantage in feeding late, and all at one feed, thick syrup. The bees store it quickly, and in the mean time there is no tendency to induce brood-rearing, because there is not time for it, and because it is too cold. The thick syrup does not require evaporation like the thinner one, and consequently does not cause the bees to set in motion their little chemical laboratories to in-

vert the syrup. Possibly there is an advantage in this. At all events, we have a number of times in late fall, when it was too cold for the bees to fly, fed a thick syrup, and in each case the bees came out in fine condition in the spring. Whether this was due to *other* favorable conditions, or whether it is an actual advantage to have an uninverted syrup, we can not say.

This is an interesting field for experiment and discussion, and we should be glad to hear from others of our subscribers who may have any thing to offer on this subject.—Ed.]

FRANK RAUCHFUSS' HOME IN COLORADO.

BY FRED W. MUTH.

Mr. Frank Rauchfuss lives in a pretty little home in the suburb of Aurora, on the outskirts of Denver. Standing before his house, in the middle of the road, one can see, at night, Pike's Peak, 95 miles distant, and from the front porch can be seen the beautiful, picturesque, snow-capped mountains some sixty miles away.

Mr. Rauchfuss needs no introduction to the bee-keeping world, as he is one of the best bee-men who ever lived, and is the manager of the Colorado Honey-producers' Association. He conducts a bee-supply and honey store at 1440 Market Street, Denver, where he disposes of many carloads of bee-

FRANK RAUCHFUSS AND FAMILY OF AURORA, COLORADO.

supplies during the honey season, and sells the product of the members of his association.

Mr. Rauchfuss and his good wife speak German at their home, which pleased me more than I can tell, for it reminded me of days of yore in my dear old home.

It would certainly make any farmer's wife envious to see Mrs. Rauchfuss' garden next to their house. Never before have I seen a

home garden under such high culture. It is, indeed, a real picture.

Cincinnati, Ohio.

DEMONSTRATION-CAGES.

A Simple Handy Collapsible Wire-cloth Cage for Public Demonstration of Bee-handling or for Work in a Bee-yard.

BY E. R. ROOT.

Perhaps some of our readers know that I have been giving talks on bees with practical demonstrations in the handling of them, before church and Y. M. C. A. organizations, at various points in this State, and it has occurred to me that there might be some who will be called upon to do the same thing, and would, therefore, like to know how I do it.

In order to handle bees before a public audience, especially at night, where the lights might draw flying bees, it is necessary to have a portable cage of suitable dimensions, and yet one which can quickly be put in a knock-down condition, to be shipped in a trunk or wooden case.

The subjoined illustration shows the cage which I have used in various public demonstrations. It consists of four wire-cloth panels, one of them containing a door, and a top covered with muslin. Each panel is made of a wooden frame stiffened by three corner-pieces secured at the intersections, and covered with wire cloth. Four of these panels are placed up against each other, and securely fastened by means of Van Deusen hive-clamps, as shown. Contrary to what one might expect, these Van Deusen fasteners make a very solid and strong cage, and yet one can, in the space of two minutes, put the whole thing in the knock-down by loosening the clamps and slipping the panels into a large flat oblong box.

After having tried this cage, and carried it over the country to various points, it occurred to me that something of this kind would be very serviceable in an ordinary bee-yard, especially where queens are reared. While one can make up a solid non-collapsible cage, yet in the winter time its dimensions will not admit of its going into any door. For that reason it is desirable to have a structure that can be put in the knockdown and stored away during winter or during that time of year when it is not needed; for it is only during the robbing season that it would be actually required. For the purpose of grafting cells, or performing any extend-

ed manipulation over a colony, it is almost indispensable, for one can work securely free from robbers, with any degree of comfort.

If one were to do a large amount of transferring, he would find a cage of this kind very convenient. There are many bee-keepers who make a business of transferring in a given locality. With an outfit of this sort one can collapse it, put it into a wagon, and, on arriving at destination, set it up, and transfer hour after hour, without any danger from robbers.

We have been using the non-take-down cages in our yard, but, unfortunately, unless secured they will be blown all about the yard. On one or two occasions a gust of wind has caught them, smashing them completely. We have been compelled to fasten them to

A NEW COLLAPSIBLE CAGE FOR MAKING PUBLIC DEMONSTRATIONS OF BEE-HANDLING.

ed trees or some stable object; but in that case they are exposed to the weather, and in one season are of but little value, as they begin to pull apart. This collapsible cage, with its Van Deusen clamps, permits one to put it out of the weather and into a building just as soon as its use is not required.

The cage here shown is 30x38 inches, and 6 ft. tall. Any good mechanic can make it out of pine strips $\frac{7}{8}$ inch square, and a few yards of screen wire cloth and 16 Van Deusen hive-clamps. It will pay for itself in one season in almost any yard.

BEE DEMONSTRATIONS OF FAR-REACHING VALUE.

Dr. Bigelow in Indianapolis. See p. 30

BY WALTER S. POWDER.

There never was a time when the people were so disposed to rate the bee industry at its true value as now. The honey-bee as a subject for a nature-study is, perhaps, one of the most interesting things in all the world, and no one can study its wonderful nature without becoming greatly interested. This being true, the bee-keeper finds his business the easiest to advertise of almost any line, because of the eagerness of the public to learn.

The present year will long be remembered as one of the poorest honey seasons; but it will also be remembered as the beginning of the era of pure foods and the end of the old story about manufactured comb honey. All in all I have never seen the bee fraternity more encouraged as to the future than today, because of the better markets, better understanding of the industry, and the increased demand for the output of the apiary. Why, it has not been many years since there was very little demand for extracted honey because it was not at all understood. Today the demand for it exceeds that for comb honey, and the demand for granulated extracted honey is increasing each day.

The public is anxious to learn, and those who are so located that they can give demonstrations with a few colonies of bees occasionally will be surprised at the great interest taken. A queen-bee in a mailing-cage on my desk, waiting for the postman, often attracts attention and starts some one to investigating. A helper placing foundation starters in sections has attracted so much attention that at times it has seemed almost annoying.

Perhaps the most interesting demonstration ever given in Indianapolis or in this State was given here recently by Prof. Edward F. Bigelow, of Stamford, Conn. Professor Bigelow was on a lecture-tour, and brought a class of 45 teachers who were taking the summer course at Butler University. His ability in this line of work can not be excelled, and I doubt if it can be equaled; and surely a class never enjoyed a more interesting discourse. He began by mounting a pedestal and first explaining the old straw skep, then the modern hive, comb foundation, comb-building, extracting, rendering wax, etc., and explaining each detail in such a manner that even a child could have understood. Then all went to the lawn where the bees are kept, and here he showed his skill by manipulating the hives and combs of brood, handing each a comb of brood and adhering bees which were accepted with some timidity at first;

but he soon had their confidence, and veils were all laid aside. The duties of the queen, brood in all stages, comb-building, etc., were never better explained, and a happier lot of people never left this honey-store. It would be interesting to know just how many times this meeting has been talked over by those who were fortunate enough to be one of the party.

One of the very prettiest little hives for convenient demonstrations is the little Pearl Agnes hive, invented by Professor Bigelow. I have such a hive in my dooryard at home, and I find it to be quite an attraction for my near neighbors. Observatory hives made to contain a single Pearl Agnes frame are the neatest device in all the world for loaning to teachers at public schools, and I am planning to place several as soon as schools begin. The honey-bee is always admired if properly introduced.

Indianapolis, Aug. 22.

SOME PECULIARITIES IN COMB-BUILDING.

BY DR. C. C. MILLER.

Bees generally attach their combs at the top, and build downward. But it is not a very difficult thing to get them to build in the opposite direction. I have known them to do so many times. Take a good colony at the beginning of the honey-flow, and place over its hive an empty hive-body, and it will pretty surely build from the top-bars upward. A peculiarity of combs thus built is that they

COMB BUILT WITH NO SUPPORT EXCEPT THE WIRES.

are less inclined to be straight than other combs. If one were to allow reasoning to the little creatures, it would be as if they should say, "When we build from the top down, we can build straight flat sheets, merely corrugating them a little; but if we should make a flat sheet when building upward it would tumble over of its own weight;" so these upward-built combs, instead of following the direction of the top-bars, or being built across them, twist in all directions, some of them forming almost a circle with a

diameter of 4 inches or more. Pictures of such buildings have already appeared in GLEANINGS, but I think nothing like the present illustration has been shown. Indeed, it is the only case of the kind I ever saw; for you will see at the central part, under the top-bar, that the bees seem to be building in mid-air. In reality that isolated piece of comb is supported by wires, which do not show in the picture because too fine.

A very old comb in very bad condition had been given in an upper story, and incidentally the lesson is taught that, although bees will clean up a very bad job, there is a limit; and if the comb is too bad they will proceed to tear it down. In the present case you will see that nearly half the comb was gnawed down. But at the part under discussion there was left a piece of the septum about as large as a silver quarter-dollar, and upon this they built. This bit of old septum is in the lower part, so most of the building was done upward. You will notice on the under side of the top-bar, directly over the floating comb, that the bees have begun a deposit of white wax, and the sharp point at the upper end of the floating piece shows that the bees would soon have united the two together.

Notice at the right of our floating comb that the bees are building upward upon the old comb.

Marengo, Ill.

[This is an odd specimen of comb-building, and, taken in connection with Dr. Miller's comments, makes a very interesting study. We should be glad to get photos of these interesting or grotesque comb curios and pay for them. While some of them are of only scientific interest others may lead to some practical results.—Ed.]

THE PLURAL-QUEEN SYSTEM.

Why it is More Practicable with a Divisible Brood-chamber than with an Ordinary Full-depth Hive.

BY J. E. HAND.

I notice that Mr. Titoff, in an article on p. 1328, asks for information about the two-queen system, and then says that he doubts whether the plan as a whole will ever prove to be a success. I will only endeavor to add what little information I have gained from a limited experience in the use of a plurality of queens in the same hive, although in separate brood-apartments. In the first place I would respectfully refer my doubting friend to an article on page 1330, from his own State, by Howard Davenes. I believe that the only advantages claimed for this system are in building up weak colonies for an early honey-flow and in the prevention of swarming when working for comb honey. It should be remembered that this system like the Stachelhausen plan of shook swarming loses its force when used in connection with the full-depth-frame hive. This fact should be evident to even a casual observer.

I wish to go on record as saying that there is but one system of contraction that is at all practical when we take into consideration the amount of labor involved and the results to be gained by such contraction, and that is horizontal contraction by means of shallow sectional hives. All other methods are but makeshifts that, by the amount of labor involved, are both expensive and inadequate.

This same statement will also apply to the two-queen system, as any one can see who will use a little sober judgment that it would be the height of folly to add to a colony of bees in early spring another full-depth hive with a queen, and only a small cluster of bees, and viewing the matter from the standpoint of the full-depth-frame hive. I can agree with pretty nearly all that Mr. Titoff has to say regarding the matter.

However, with the sectional hive it is far different, and a shallow brood-chamber containing a queen and a small cluster of bees, and some brood, if simply placed upon a strong colony of bees as soon in spring as the weather will permit, will soon build up to a rousing colony of bees. Another section of brood-chamber may be added if desired, after the first has become well stocked with brood and bees. Of course, a queen-excluder is used to keep the queens apart. These colonies, after becoming strong enough, may be separated, or kept together up to or even through the honey-flow according to the time of said flow.

For instance, if the honey-flow comes late in the season it may be desirable to separate the two-queen colonies as soon as they become strong enough, and I believe this is the method adopted by Mr. Alexander, who secures a great part of his surplus from buckwheat. In a location where the main honey-flow comes from clover and basswood it is far more desirable to keep the bees together up to the beginning of the honey-flow. Further than this, there should be no iron-clad rules governing the case, as the further disposition of the colony is a matter to be decided by the operator according to the probable duration of the honey-flow and the consequent liability of the bees to swarm.

If no swarming is desired, and the prospect is good for a fair flow of nectar, I know of no better method for the average bee-keeper, under ordinary circumstances, than the following, which is the Stachelhausen plan of shook swarming, only in our case there is no handling of combs except by hives.

A MODIFIED PLAN OF SHOOK SWARMING ADAPTABLE FOR BEGINNERS WITH THE DIVISIBLE HIVE.

First we will begin at the top of the two-queen hive by blowing a little smoke down between the brood-combs, and fanning it down with a Coggs hall bee-brush. We drive most of the bees down and out when we remove this section of brood-chamber, giving it a quick jerk to dislodge the bees, and place it on a bottom-board. We proceed in like manner with the next, which is placed upon the other. The queen in the upper

part will be either on the honey-board or in one of the sections of brood-chamber treated, and should go with this hive, which is now placed upon a new stand.

We now have the bees of the two hives in one hive with the other queen; and if left in this condition when working for comb honey they will soon cast a swarm, so we will proceed with this hive exactly as with the other, except that in this case all the bees as well as the queen are driven into an empty hive consisting of two sections of brood-chambers with frames filled full of foundation. This hive, having been previously placed below and on the bottom-board previously occupied by the colony treated, it will remain there. The hives containing combs of brood and honey, but no bees, may be tiered up seven or eight high to be drawn on when desired.

In 48 hours after treating, a queen-excluding honey-board is placed upon the hive containing the driven swarm, and upon this a super of sections filled with foundation: after which the bottom section of brood-chamber is removed, and the bees shaken out in front of the hive.

Our object in hiving the bees in the first place in two sections of brood-chamber was to prevent them from swarming out the next day, as they are almost certain to do if hived directly into a contracted hive; and our object in removing the bottom section of brood-chamber after the bees have settled down to work, and given up the idea of swarming, is to contract the brood-chamber so as to force the bees to begin work in the sections at once; and as soon as the work has well begun in the sections, more room may be given by adding another section of brood-chamber containing either combs of honey or combs of brood from the piles that were tiered up, or frames of foundation, at the discretion of the operator; and, according to the probable duration of the honey-flow, such should in every case be placed at the bottom, and directly upon the bottom-board, and in no case should more than two sections of brood-chamber be given with one queen during the honey-flow.

If the honey-flow be of long duration it may become necessary, in order to prevent swarming, to remove one of the sections of the brood-chamber, giving in its stead one containing frames filled with foundation. In this case the empty brood-section should always be placed at the top of the brood-chamber. The queen-excluding honey-board should be removed as soon as the brood-nest is well established and work has well begun in the sections.

We have found that, with a honey-flow lasting four weeks, these extra strong colonies will often make preparations to swarm again unless room is given in the brood-chamber by exchanging frames of brood and honey for empty frames, as stated above. This is on account of the top section of the brood-chamber becoming somewhat clogged with honey. Colonies treated as above will, during a good honey-flow, roll up an amount of comb honey that will astonish some of the

oldtimers who can see no advantages either in contraction or in the two-queen system. "Where ignorance is bliss, 'tis folly to be wise."

I would especially recommend the system, as outlined in this article, for beginners, and especially in locations having a fair to good honey-flow, in preference to the one outlined in my season's work with the sectional hive, which, being somewhat complicated, is better suited for the expert honey-producer, and in locations where it is not possible to secure a crop of comb honey by the usual methods.

The descriptions of these hive manipulations are, of necessity, somewhat tedious in order to make every thing plain, although the manipulations themselves are very rapid.

This article is already long, and yet the subject is not finished. With the editor's permission I will finish it in the next issue.

THE PLURAL-QUEEN SYSTEM.

A Protest Against the Plan; Time and Money Should be Spent in Breeding Better Queens Rather than in Striving to Make a Lot of Poor Queens Live Together.

BY WM. M. WHITNEY.

Mr. Editor:—The discovery of plurality of queens in the same hive seems to be attracting attention, and causing no small degree of surprise, even among old and experienced bee-keepers. It seems somewhat strange that this should be so, as it is a well-known fact that other than mother and daughter have been found in the same hive living peaceably together. If I'm not mistaken, I have read somewhere of an exhibition at some fair in Europe of a hive of bees with four queens living in harmony together. Also, in the third edition of Langstroth by Dadant, on page 222, there is a very interesting account of five colonies occupying one hive, and the same account is repeated in the last revision. It may be said that these colonies occupied different portions of the hive, and acted entirely independently of each other; but the fact remains that they must have had the same scent, and the bees must have mingled, or were likely to have mingled more or less together during the time of their occupancy of the hive, and must have had an opportunity to destroy either of these queens.

In 1898 I thought to experiment along this line, and for the purpose made what is known as a jumbo hive, two stories and double-walled, to contain 16 frames in the brood-chamber, with perforated zinc division-board in the center. With this arrangement I thought to secure, if two queens could be made to live in peace, a large amount of surplus comb honey. After two failures I succeeded in securing queens that the bees tolerated, but not a section of honey did I get from that hive, notwithstanding the sea-

son was a fairly good one, and other colonies produced a fair crop of section honey.

In the following spring I found one of my queens missing. It occurred to me that there were virtually two hives in one, with all the danger of losing a good queen at any time, as well as that of disturbing both colonies in handling one, and the other disadvantages that presented themselves to me caused me to abandon the experiment, with the thought that the game was not worth the powder.

The idea that it is a good thing to have two or more queens in one hive in early spring for the purpose of building up strong colonies does not appeal to me. If, with my management, it required two or more queens to give me good working force for honey-gathering at the proper time, those queens, young or old, would be condemned and executed. I'd give very much more for one good queen than for half a dozen poor ones at any time of year. I should hesitate to buy queens from any breeder who thought it necessary thus to build up strong colonies in the spring, for fear that I'd get the most common sort of layers in time if the practice were continued. Adopt the practice of using only large and well-developed queens; let the management be such that the colony shall be kept warm in early spring, and have the right kind of nourishing food, and plenty of it, then one queen will soon fill the brood-chamber to overflowing with ambitious workers when there is any thing to be done. Such will be found to be a colony in normal condition, and nothing better could be reasonably hoped for.

If I may be permitted, I'd like to illustrate what I mean by giving an example from my own yard. My apiary is pretty well known as having strong colonies in the spring. For example, let us examine No. 25, which is a fair sample of hives in the apiary, so far as numbers are concerned—a two-story double-walled hive with 9 Hoffman frames in the brood-chamber and 10 in the second story. On June 5 this colony swarmed. I captured the queen and put the cage containing her in my pocket and awaited the return of the bees. In the mean time I prepared three hives for use in dividing the colony. When the swarm had returned, and become quiet, I removed the cover and found not only the hive proper but the two-inch air-space outside of the super literally filled with bees. Selecting a frame of brood containing one or more nearly ripe queen-cells for each of the three hives, I proceeded to remove the ten frames of brood and bees from the super to the center of these hives, making as nearly an equal division as possible; then I shook bees from some of the frames of the brood-chamber into each hive; filled them at the sides with empty combs, when they looked, for all the world, like fairly strong colonies. Then I filled the super of the parent colony with ten more frames of comb, and released the queen. These newly made colonies at the time of swarming may be placed immediately anywhere in

the yard without danger of bees returning to the parent hive, which is not the case at any other time; but, to return to the parent colony.

On the 5th of July, the record shows, I examined it and found the super fairly well filled, and considerable of the comb capped. I put a section-case on top of the super, but this was done too late; for on the 13th another swarm emerged. I took off the super, cut out the queen-cells, and added two more section-cases, hoping to secure comb honey; but the season immediately changed, so that only about one case was secured. I extracted about 50 lbs. from this hive—40 from one of the new colonies; 30 from another, and took two-thirds of a case of comb honey from the other; besides, each put in stores enough for the winter.

Now, the point is this: What would any one want of two or more such queens in one hive? I do not know what I'd do with half a dozen of Root's \$25.00 queens in one hive. Can you tell? But such queens are just such as I want, and I'll have no other if they can be obtained.

I forgot to say that, at the last cutting of queen-cells, three hatched at the operation, which I used for requeening. They are from the stock of that old queen I have thought so much of, and have tried to perpetuate in my apiary.

Lake Geneva, Wis.

[The Root \$25.00 queens are very scarce with us; that is to say, we seldom find one good enough to bring that price. If we could get plenty of such queens there would be no need of discussing this plural-queen system, as there would be nothing in it. To go a little further, could we stock a whole apiary with even three or five dollar queens? It *can* be done at considerable labor and expense in weeding out stock below this grade; but how could we *know* the first season, and before the honey-flow, that *any* queen would be a good one? As that does not seem practicable, is it not advisable to run two queens to the hive, and then, if one of them should prove to be of little value, the other, according to the law of chance, would make up for the deficiency of the other? By having two or more queens to the hive we reduce the chance of failure of a whole hive, and at the same time make more sure of getting something for the labor expended.]

Then, moreover, if at any time we run short of queens we can draw from a colony that has one to spare. At all events, after the honey-flow the chances are that the colony will cut down its queen force to one.

If we run the yard on the two-queen plan, by all means strive to make the two just as good as if we were rearing only one to the hive. This would give us two queens, one of which ought to be a good one, even if the other were not.

It is not wise just yet to predict the ultimate success and general adoption of the two-queen system. Candidly, we don't know what the future is to be.—Ed.]

SOME SWISS COMMENTS UPON AMERICAN STATEMENTS.

A Translation of a Letter from Dr. K. Bruennich.

BY DR. C. C. MILLER.

I have received from Dr. K. Bruennich, the Swiss authority, an interesting letter in which are some comments upon things Swiss and American that I am sure will be of general interest. I'm too poor a German scholar to give a literal translation, but will take the liberty of giving a very free translation, begging the good doctor's pardon if in any way I misinterpret him.

"Americans are apt to depreciate our hives (which are mostly handled from behind instead of above), but unjustly. They forget that the high price of land here forbids spreading out hives of the American pattern, and so we are driven to the use of the pavilion, which allows colonies to be tiered up. This plan is not without advantages. In the pavilion there is the mutual conservation of heat, and practical operations may be carried on under cover, without any fear of robbers—two very important advantages."

Yes, I've no doubt, doctor, that some of our leaders would view things quite differently if they should for a time take up their abode in Switzerland; and possibly a sojourn in this country would also change some Swiss views. There's a good deal in the way one is brought up; a good deal in fashion. For example, in this country we have an outlandishly absurd way of spelling; but when President Roosevelt, who has pretty much his own way in every thing, attempted to spell a few words in a decenter manner, it raised such a hubbub that for once he had to back down and give up to the fashion.

"Referring to GLEANINGS, p 822, I must say that, with all due respect to you, I am not yet convinced that a pure strain of blacks, as we cultivate them here, would not be the best for you, even under *your* conditions."

I wonder upon just exactly what you base that belief, doctor. Perhaps upon the fact that the great majority of Swiss bee-keepers have found that the native blacks in their purity give better results than any other race or mixture of races. But facts all run the other way here. In hundreds and hundreds of cases Italians side by side with the blacks have shown their superiority over the blacks so plainly that there can be no question left; and when I can get 10, 20, or 50 per cent more honey from Italians, or from a cross containing Italian blood, do you blame me for not wanting pure blacks?

I think you Swiss put considerable stress on the matter of *native* stock as being better adapted to the country. Please remember that blacks are no more native than Italians in this country, all bees being imported. Perhaps, too, we Americans are too new a nation to have very much reverence for things old and established. At any rate, the word "imported" has quite a charm for us.

I sometimes pay double price for a pound of Swiss cheese, and I suspect that just a little of its superior flavor is due to that magic word "imported." Perhaps it would not be a bad thing to "import" from Switzerland some of the best black stock and see if it might not be an improvement. Almost certainly it would be an improvement over the black stock we have had, if not over the Italian.

Dr. Bruennich wonders that so excellent a journal as GLEANINGS should publish what he does not hesitate to call "blooming nonsense" on p. 831, under the heading "An Improved Strain of Bees." There is a "blend" of three different kinds: "Cyprians for their get-up and get; Carniolans for gentleness and white cappings of comb honey, and Italians for compact brood-nest, non-swarming disposition, and color."

Well, doctor, an ignorant German Swiss like you can not understand such things. It takes those Texans. They say some magic words, and from each variety comes its specially good virtue and none of its faults. Now if *you* should try the thing over in Switzerland, without the magic words, it might turn out something like this: "Cyprians for their vile temper, Carniolans for swarming, and Italians for any bad trait they happen to have."

Seriously, in this country we pay too little attention to theory, and among those of us who have been working the hardest to get crops of honey there is very little known about breeding bees in anything like a scientific way.

"Page 895 needs a correction, where it is said that Switzerland is the homeland of the leather-colored Italians. These bees never appear across the Alps from Tessin, and so are quite isolated in that canton from Switzerland in general, where we cultivate black bees and will have nothing to do with the yellow bees, which have absolutely not stood the test with us, and are far outstripped by the blacks."

"Among the names of prominent scientific men connected with the bee industry in Switzerland, as given on page 895, Kramer should have taken first rank, who by his colossal labors has accomplished more than all others. He it is who established our apistical stations, sifted and collocated their results; he it is who established our 'beleg-stations,' drone-proof places where virgins are sent for fertilization; and he yearly assembles more than a hundred queen-breeders for a conference regarding matters connected with queen-rearing and improvement of stock. A great mass of valuable discussions and investigations come from his pen. Prof. Burri is no bee-keeper—only a bacteriologist, but a fine one.

"Page 1018 also has its errors. The movable frame was invented by Berlepsch (in some unaccountable manner no biography of Berlepsch occurs in the A B C), next to Huber the most important investigator in the realms of bee culture."

Whatever Berlepsch may or may not have

done—and I fully accord to him great credit—unless I am entirely misinformed, Langstroth invented the movable frame without any knowledge of what was done by Berlepsch, and I think that, in point of time, the invention of Langstroth was prior to that of Berlepsch. And from whatever source bee-keepers across the water may have first got the movable frame, it is a fact that I think you ought to be willing to recognize, *that American bee-keepers got the movable frame in its present usable form, not indirectly but directly from Langstroth.* From personal acquaintance with Langstroth, I am convinced that, if he had had the slightest hint of any thing done by Berlepsch looking toward the invention of the movable frame, he would have been the first man in the world to acknowledge it.

"On page 1018 the first grafting method of rearing queens is given at about 1874. More than 100 years ago Huber transferred larvæ from one cell to another. The works of Huber should be read by every bee-keeper, containing as they do a fullness of interesting experiments almost totally forgotten, which deserve again to be brought to light.

"The last remark of W. K. M., page 1018, again shows plainly the attitude of certain Americans, from whom you are excepted."

Certainly we ought to be a little slow about calling a people slow from whom we have received so much that is valuable, and least of all the Germans in Switzerland, who are in the front line in more than one regard. When it comes to the matter of scientific queen-rearing, Switzerland leads the world, and in their presence we are as babes before giants. But we have a young man in Washington, Dr. E. F. Phillips, of whom we are very proud, and we are looking to him to give us a start on the road to overtake the Swiss, so that queen-rearing may rest upon a more scientific basis.

The time has come when I am glad to say that the peoples on the two sides of the big pond are beginning to stop making faces at each other, and trying to get all the mutual help they can; and it is to be hoped, Dr. Bruennich, that you will keep whacking away whenever you see any of our faults to whack at, and at least some of us will take it in good part, with the cordial feeling "We be brethren." *Ja, wir sind Brueder.*

Marengo, Ill.

[I shall attempt to answer in as few words as possible. Southern Switzerland, particularly the region of Bellinzona, is certainly the place from which many leather-colored Italians came. The old files of the *American Bee Journal* (see advertising pages) bear abundant proof of this. For example see last page of the May issue, 1872, *A. B. J.*; also page 231 for 1873 of the same journal, an article by the late Charles Dadant. Moreover, I quoted figures quite recently to show the Swiss are by no means unanimous in favoring the native black bee. By their own figures (see *GLEANINGS*, page 1135, Sept. 1), they regard hybrids very highly, and a number prefer Italians (Swiss Italians).

As to the assertion that Berlepsch invented the movable frame, there is no ground for it. He brought out his hanging frame in 1855, four years *after* Langstroth. Huber invented movable-comb frames in 1789, before Berlepsch was born. At the present time the Germans are rapidly adopting the Langstroth system. They are now imitating our hives to the smallest detail, long after the British, French, Belgian, Italian, Spanish, Australian, Russian, and American bee-keepers. It is true, Huber did transpose bee larvæ, but he was no German; on the contrary, they were about the last to accept his teachings. If we owe anything to Berlepsch we should like to know what it is. The *A B C* does not contain his biography, it is true; but it also does not contain any thing about Swammerdam or Reaumur—two giants whose names will live long after Berlepsch is forgotten. When the Germans come to this country, in a few years they soon adopt American ways; and I doubt not they greatly excel the Germans left in the fatherland. Look at Wagner, Grimm, Stachelhausen, Hoffman, and Greiner. They joined on German "theory" and American inventiveness.

I admit too many of our "scientists" have turned out to be "nature fakirs." Europe is not altogether free from the same trouble. Science is popular now, and all sorts of people masquerade as "scientists." America has no monopoly of this either. This is the reason why our bee-keepers are so skeptical about "theory." They do not know when they meet a real *savant*. We are not alone. France is not one whit behind Germany in scientific research, and yet it does not accept German ideas any more than we do. Neither does England.

Burri is undoubtedly a great investigator in his chosen field, and the University of Zurich is second to none. More than a year ago I sent to President Kramer for his photo for a write-up, but thus far we have not had the opportunity to place him before a *GLEANINGS* audience. I agree with you we owe all our progress to scientific men, and we Americans worship money-making "practical" men far too much. We are not alone in that either.—W. K. M.]

TRANSPARENT PAPER WRAPPERS FOR SECTIONS OF COMB HONEY.

Transparent Paper Bags Suggested; These to be Made Just the Size of the Section; the Opinion of a Prominent Commission Man on the Subject.

BY R. A. BURNETT.

Mr. Root:—We have just read Mr. Sackett's article in your issue of Dec. 1, also your comments thereon. We are inclined to agree with both your conclusions and his. The wood strips in the bottom of cases, when fastened in and made to fit exactly with the sections, help very much where there is only a little leakage from unsealed cells; but where

one or more combs are jarred from the wood they are of very little service. This idea would be practically the carton, with the advantage of being transparent (which is a most desirable thing). The extra cost of preparing the case, such as the no-drip case, would, in our opinion, offset the cost of papering the sections after the fashion described, as they would then be put in a perfectly plain case; and if even half of the sections should be broken from the frames the remainder would be uninjured where the paper itself was not broken. It occurs to us that the paper could be made as a bag is made, and the sections slipped into them and then secured with mucilage or some form of paste.

To-day we were going through some honey that came in carriers, containing eight cases. Some of the comb had broken out of the frames, and had leaked sufficiently to fill more than the space between the strips, thus necessitating new papers in the bottom where the strips could be removed. In this instance the nails used were cleated, and this made it difficult and in some instances impossible to put the case again in good order. It would seem as though before another season different experiments could be made with this idea, and a heavier weight of paper secured than has been tried. At any rate, it is one of the devices that appeal very strongly to us, and we hope by your January or February issues sufficient progress will have been made with the idea already demonstrated as practical, that will insure its coming into use next season with those who have to order supplies.

Chicago, Ill.

WHITE ITALIAN CLOVER TRIED TWO YEARS
AGO, AND ALMOST A FAILURE BOTH
FOR HAY AND HONEY.

Two years ago I bought some seed of white-blooming and some of the old standard kind of crimson clover from the firm mentioned on page 1385, and sowed them side by side at the same time, and on land prepared the same way. The regular crimson clover made a good crop.

The white-blooming was so late in starting in the spring that the weeds got ahead of it, and it was almost a failure. I did not feel that I had any ground of complaint against the introducers, as at that time about all the difference they claimed for it was that it was later and had white blossoms. Since reading the article by W. K. Morrison I have looked up their latest catalog and am quite surprised at the claims they are making for it.

As to its honey-producing qualities, I can not remember that I took any notice of it. I have never known bees to fail to work the regular kind very freely as much as or more than any plant I know.

Barboursville, Va. A. R. LOCKHART.

THE BEST TIME TO REQUEEN; J. E. HAND RE-
CONSIDERS.

Upon further experimenting with a view to determine when is the best time to requeen an apiary I am led to change my views as expressed in my article on page 1586, Dec. 15; and with my present light upon the subject I now consider the latter part of the season, and after the close of the honey-flow from basswood, which, in my location, is about July 20, to be the best time to requeen an apiary. One reason for this is we have found that queens reared at this time will keep up brood-rearing late in the season, and will have stronger colonies the next spring; and the other reason is, that the time of our cell-building colonies is not worth any thing at this time, and therefore it costs less to rear queens, since we are out only a very little labor.

ACID FOR DISINFECTING FOUL-BROODY
COMBS.

One of your readers at this place writes to ask if it is not practical to dip foul-broody combs, where it is dried to a scale, or nearly so, into a bath of diluted acid or other liquid disinfectant. He adds that, if he is correctly informed, a weak kerosene emulsion will effectually kill the San José scale, and that gasoline is sure death to germs of almost any kind; and as wax is in no way injured by acid he does not know why some agent of this kind could not be employed to aid in the battle with foul brood. Will some accommodating expert grasp a foul-brood germ by the hind legs and jam his head into a bottle of muriatic acid, then examine him in his microscope, and give us the result?

Jamul, Cal.

BEN BIDDLE.

[We hardly think the acid bath for diseased combs would be effective. Better by far melt them up.—Ed.]

THE RAT PROBLEM.

A year ago we moved on to this place, and it was the worst-infested place one can imagine, and has been for the last 24 years that we have been acquainted with it. We were fully determined to get rid of the rats. We got four different kinds of traps, and then tried every thing we could hear of; and when you said "rat biscuit" my husband laid in a supply at once; but they were like all the rest—just seemed to act like a tonic, and still the rats came. At last one of our hired boys told me he had seen a sure cure for rats, in a paper. I told him to tell me quick, as we were at the point of collapse. He said, pour syrup, or any thing the rats are fond of, on to a board and sprinkle with

dry concentrated lye. As I had found the rats preferred nice firm ripe tomatoes to anything else I had on hand, I sliced up several about $\frac{3}{4}$ inch thick, and placed in different parts of the house. In the morning they had eaten all I put out. The second night they ate half as much. The third night only a few pieces were gone. The fourth night they did not touch the tomatoes nor any thing else, and we have not seen or heard of a rat or mouse in the house since, about six weeks ago. A couple of weeks afterward Mr. Shank said there were as many as ever in his barn and granary, and he thought I had only driven them out to the corn; so I fixed the tomatoes the same as before, with the same effect. The third night was the last. We think it is truly wonderful to be without the horrible things, so we just concluded to let you tell others.

Just sprinkle the dry concentrated lye (I use the Banner, as it is so handy) on the top of the tomatoes. Other articles may do as well.

MRS. L. B. SHANK.

Jenny Lind, Cal.

BENT NAILS FOR FRAME-SPACERS.

What do you think of this idea for spacing-nails?

L. E. SCHERER.

Jersey Shore, Pa., May 29.

[The arrangement here shown, if properly applied, is excellent; but in the first place it is difficult to bend the nails, and, in the second place, it would be more difficult still to bend them all with *exactly the same curve*, for it would be important to have the bee-spaces alike. In the third place, one would have to bore a hole in order to drive them into the frame, for the reason that the hammer-head would strike one side of the line of penetration of the wood, bending the nail over. Taking it all in all, the ordinary staple is much easier to insert, and far cheaper.—ED.]

MEETING OF THE MASSACHUSETTS SOCIETY OF BEE-KEEPERS.

The Massachusetts Society of Bee-keepers held its second meeting in the Ford Building, Ashburton Place, Saturday evening, Decem-

ber 7. President Farmer president. There were thirty present on this occasion, and all seemed to enjoy hearing the different speakers. After the routine business, the meeting was given into the hands of the members.

Mr. Barret, of Hyde Park, spoke first on the duty of the bee to the flower in the transferring of the pollen, referring especially to such plants as have male and female flowers on different individuals. Mr. J. S. Chase, of Malden, the veteran fruit-grower, followed in the same line, speaking particularly of the work of the bees with reference to grapes, of which fruit he has been a grower for thirty-five years. He laid stress upon the fact that species do not come true from seed, and illustrated his point by his own experience with seeds of Delaware grapes from which he had obtained many varieties of grapes of all colors, but never a Delaware. His fruit has several times taken the first prize at the Massachusetts Horticultural Society.

Mr. Chase showed a model of a storm-door for his hives for winter, in which all felt great interest. Mr. Chase spoke of his new bee-feeder that consisted of a box 25 inches by 15, and 5 inches high, made to cover the frames. A piece of glass was fitted over this diagonally from the bottom of one edge to the top of the opposite side. Over this was the cushion. Thus he was enabled to lift the cushion and observe the condition of his feeder without cooling off the bees.

Mr. Adams, of Byfield, Mass., and Mr. Richardson, of W. Medford, two vice-presidents, were chosen at this meeting; then after an informal recess, during which we all enjoyed ice cream and cake furnished by our president, F. H. Farmer, Mr. Hawkins, of Everett, described the Atwater method of transferring by use of a tube from one hive to another as given in the *Bee-keepers' Review*.

Mr. Richardson also told of his experience of four years.

Our next regular meeting will be the first Saturday in January, 1908, in the afternoon. As there are only four more meetings we hope for a good attendance.

Belmont, Mass.

X. A. REED.

CAGE THE QUEENS WHEN SHAKING BEES ON TO NEW COMBS.

It has not been clearly stated in the journals that it is necessary to cage the queen when the bees are shaken on to new combs. One of our bee-men of Tulare, a Mr. Gambel, had 78 colonies shaken on to frames of foundation for foul brood, and none of the queens were caged; 75 out of the 78 swarmed, and went to the woods.

Tulare, Cal.

T. J. BARRINGER

COVERING CRACKS IN HIVE-COVERS.

I use muslin bats for putting over joints on covers for hives. Get heavy bleached muslin and cut the length needed, and 3 inches wide. Cut in lengths long enough to lap over the edges; lay this in paint, and, when put on, give a good coat of paint. I

have used this kind for over 15 years, and would have no other. Try this and be convinced.

C. H. McFADDEN.

Clarksburg, Mo.

[One or two others of our correspondents have described this same thing and pronounced it good; so we must conclude that this method of protecting hive-covers is not only practicable but easy of application.—Ed.]

MORE THAN ONE QUEEN WINTERED IN THE SAME HIVE.

Friend Root:—In regard to plural queens wintering in the same hive, perhaps I can throw a little light upon the subject without waiting until next spring. While I am not a plural-queen bee-keeper, for the past three winters I have had two queens winter in one hive.

I always clip my queens in the spring, long before there are any queens hatched or drones to fertilize them if queens were hatched.

In the spring of 1905, when clipping, I found a clipped queen and an unclipped queen in the same hive (apparently mother and daughter), and both were busily depositing eggs on the same comb and on the same side of it. I left the young one without clipping, and opened the hive frequently, only to find both busily engaged as before; but along about the middle of the summer I could see the old one was failing, and continued to grow weaker, and finally disappeared. Then I clipped the young one. This was at an outyard.

The spring of 1906 I was clipping the home yard the latter part of April, and I found two unclipped queens in one hive (apparently sisters, as they looked exactly alike), both busily engaged in depositing eggs on one comb, though on opposite sides. I clipped both and removed one to supersede an old one. Both did good work all summer, and again the past summer, and I think they are both still alive.

Last spring, when clipping in the home yard I found one clipped and one unclipped in one hive—apparently mother and daughter—both depositing eggs; but the old one seemed somewhat feeble, and did not live to exceed a month. Some skeptic may say this was accidental, and the young queen came from some other hive after they were removed from the cellar; but, not so; and, even were it probable, how would they explain or account for the two *young* ones in the same hive? I had no deserting or swarming out, and cases were exactly as stated. I mention this merely to refute any such argument as might be advanced.

ELIAS FOX.

Hillsboro, Wis.

[The cases that you cite, of mother and daughter both doing service at the same time in a hive, are so common as to excite hardly even a passing comment. It would not be at all strange if a pair of such would get along peaceably in the same hive over winter; but it is remarkable that two daughters after the old queen disappeared, while they

were virgins, should not have had a battle royal, with the result that one of them was killed. Apparently in the case given there was no conflict, but, rather, they both went to work laying eggs, and would probably have continued to do so as long as the colony prospered. But during a dearth of honey, probably one of them would disappear if not removed by the apiarist.—Ed.]

BEEES CHOOSE A LOCATION BEFORE SWARMING.

I am pleased with GLEANINGS, and do not know how I could do without it. In the Dec. 1st issue, page 1507, is a statement by Mr. G. C. Greiner which seems to me the most correct of any I have yet read concerning runaway swarms. I have known a prime swarm to issue, leave without clustering, and enter a tree. The owner, being a swift runner, followed the swarm to the tree, about half a mile distant, and cut the tree. In less than two hours after, bees entered. He found combs six or eight inches long. Did the bees not prepare a home and build some comb? They were new, and had just been built. The old queen as a rule gives warning by a piping the same as a young virgin does in after-swarms.

Carbon Black, Pa.

WM. F. EBERT.

[Swarms will very often leave without first clustering. It may be in such cases that the scouts have located the tree, and lead the swarm to it direct.—Ed.]

CAUCASIANS NOT AS GOOD HONEY-GATHERERS AS THE ITALIANS.

I have two colonies of Caucasians from Washington that seem so energetic in plastering with propolis every opening about the fences, sections, and frames, that they do not gather as much honey as the Italians and hybrids. I now have enough Caucasians. I will Italianize my apiary a little later.

Pickel, Tenn.

F. R. C. CAMPBELL.

KING BIRDS.

Mr. Doolittle, in the Jan. 15th number, talks of the king birds. His experience tallies with mine, except that I never saw them bother the bees only when there was a drone flight on, and so far as I could see (and I have watched pretty closely) they caught only drones or queens. A shotgun is the only effectual remedy that I know of.

Sheridan, Can.

W. I. DEVLIN.

[We have seen them actually catch *bees*.—Ed.]

DUCKS IN AN APIARY.

How would it do to keep ducks in the apiary for keeping the grass down? Would they eat the bees?

B. F. MILLER.

Memphis, Tenn.

[We hardly think so, as we had ducks in our bee-yard all last season, and experienced no trouble.—Ed.]

OUR HOMES

by A. I. ROOT

The wrath of man shall praise thee. — PSALM 76: 10.

On page 1216, Sept. 15, I quoted from the Pabst beer advertisements that the United States Department of Agriculture "Officially declares beer is the purest and best of all foods and drinks," and I lamented that the Department of Agriculture declared we had no laws to prevent the use of a statement that it did not make. As this same advertisement was accepted by a great number of papers I feared many good people might be misled by it. Well, their statement has done good after all in bringing out strong protests and denials from both the clergy and able physicians and surgeons. See the following:

Dr. S. H. Burgen, a distinguished surgeon of very long practice in Toledo, O., says: "Beer-drinkers are absolutely the most dangerous class of subjects a surgeon can operate on. Insignificant scratches are liable to develop a long train of dangerous troubles. Sometimes delirium tremens results from a small hurt. It is dangerous for a beer-drinker even to cut his finger. All surgeons hesitate to perform operations on a beer-drinker that they would undertake with the greatest confidence on any one else.

Now read this also, from the Cleveland Plain Dealer:

Temperate drinking, and the moderate use of beer, especially, were strongly condemned last night by Rev. Charles Bayard Mitchell, pastor of the First Methodist Church, in a sermon on "The Devil's Popular Bait."

"Nothing is more harmful to good health," he said, "than the so-called temperate use of beer. It is the most dangerous form of intemperance. A prominent physician affirms that forty-nine out of fifty cases of Bright's disease under his care were cases of beer-drinkers.

"The Northwestern Life Insurance Co., with its home office in Milwaukee, whose beer has made it famous, will not grant a policy to the lager-beer brewers, their clerks, book-keepers, or anybody else employed about the factory. They say, 'Our statistics show that our business has been injured by the shortened lives of those who drink beer.'

"It is known to all intelligent men that beer-drinking clogs up the liver, rots the kidneys, decays the heart and arteries, stupefies the brain, chokes the lungs, and loads the body down with dropsical fat.

"Intemperance is the strongest besetting sin of young men to-day. More young men are being ruined in body, mind, and soul by this insidious evil than by any other agency of hell. This is due to the fact that the business is so profitable.

"Intemperance stands in the way of your business prospects. It will ruin you socially. It will destroy your character. If you haven't touched liquor, don't. There is no such thing as moderate drinking."

After reading the above two statements, what do you think of the Pabst people, and their statements in regard to their various concoctions besides their "famous" beer?

WHAT HAVE YOU TO BE THANKFUL FOR?

In the issue of the *Sunday School Times* just before Thanksgiving day, the editor gave the replies of *thirty-one* men and women of national reputation to the question, "What have you to be thankful for?" I should like to give a lot of them, but can take space for only one, which see above:

From Bocker T. Washington, LL.D., Principal of Tuskegee Normal and Industrial Institute.

First, for the opportunity to work. Work is the greatest blessing that a good Providence has conferred upon the human race. Any one who has learned to love work for its own sake can not fail to be supremely happy. The man who has something to do is to be envied; the man who has nothing to do is to be pitied. Again, for the opportunity of exerting some influence in the world for the uplift of humanity. Thirdly, I am thankful for a serious and great problem to engage my attention and my activities.

Perhaps the above does not strike everybody as it does my particular self, but I believe it to be true that, during all my life thus far, I am happy only when I am busy. It is always a punishment for me to be obliged to sit still and wait for something or for somebody. Of course, I like to rest when I am tired; but I can't get a real good *restful* rest unless I have something to read—that is, something elevating and profitable; and I also want sleep when my physical machinery gives notice it is not in shape to do its best; and I dearly love the sleep that puts me in "good repair" for work once more. When I feel unable to do hard work I enjoy getting hold of my light hoe or a hammer and saw—any thing to "keep busy," for Satan always does "find some mischief for idle hands to do."

TURNING ON THE LIGHT.

I sincerely hope some of you have been induced to subscribe for the *Sunday School Times* just because of the frequent extracts I make from it. Here is another:

There is no answering the straight answer that President Roosevelt makes to those who, writhing in the toils their own hands have wrought, savagely accuse him of causing their disaster, when he says, "I was responsible for turning on the light, but I was not responsible for what the light revealed." Let us remember this in all our choices. We, and we alone, are responsible for the wretched harvest that is sure to follow the seed-sowing of sin.

I believe it is true that quite a few, and some very good people, have felt that our President has sometimes been a little too abrupt; that he might, perhaps, have averted the panic, and "stringency," that have been so much discussed, if he had let on the light a little more gradually; and this reminds me of reading about a father who came into the parlor one evening and suddenly turned on the electric lights, and found his daughter and a young man both occupying the same chair. Was it the father's duty, do you suggest, to find out if any one was in the room before he went in thus suddenly? *Not at all.* Nothing should ever be going on, in *any* home, that would cause embarrassment by turning on the lights; and, furthermore, nothing should be going on in our *whole great nation* that would bring consternation to bankers, politicians, or anybody else, if our President should take a sudden notion to turn on even the *search-light*.

THE \$10.00 SECRET AND THE \$1.00 SECRET
FOR SELECTING THE LAYING HENS.

I have succeeded in getting both the above secrets without signing any contract not to divulge, and without giving any promise

whatever. It is true I did have some correspondence with Walter Hogan, and I sent him \$10.00, telling him I could not sign any contract. He returned the money, told me of his misfortunes in disposing of his invention, etc., and said he would like to have me test his discovery. I then gave him my promise not to divulge any thing he might submit to me. He has, however, at this date, Dec. 18, never submitted any thing; but one of our subscribers sent me some time ago Hogan's seven-page (\$10.00) pamphlet which he purchased for one dollar, and that, too, without any promise to keep the secret. I have given you the above particulars lest any one may accuse me of getting the "secrets" by any dishonorable means. I procured the \$1.00 "Potter secret of selecting the laying hens" by simply sending \$1.00 for the little pamphlet of 32 pages. I did not sign any contract not to "divulge," but *they* wrote my name in the contract with a *typewriter*. Had they put my name in with pen and ink it would have been forgery.

Now, friends, what do you think of this whole business—taking \$10.00 for a seven-page printed pamphlet, and \$1.00 for a 32-page printed pamphlet, and extorting a "promise not to tell"? According to their printed claims they have taken *hundreds* if not *thousands* of dollars from poor hard-working poultry men (and *women*), for these celebrated secrets. Is it honorable, and is it in keeping with the spirit of the times, with the usual mode, let us say, of giving and receiving knowledge?

THE GREAT SECRETS.

I say secrets, for both are one and the same thing, and I have no means of knowing who is the real inventor—Hogan or the Potter folks. More than 50 years ago, when a boy, I discovered I could tell by taking my "pet biddies" off the roost, the night before, which hens would lay an egg next day, by placing my fingers between the pelvic bones. The egg is often, if not always, so near perfect that it can be plainly felt, and these pelvic bones are at such times more or less widely separated. All Hogan or Potter claims to have discovered is that all great layers have space enough between these pelvic bones to allow three fingers to drop into the space.

All moderate layers will permit only two fingers; and where there is space for only one finger, the hen or pullet is not laying at all, and sometimes has never laid an egg, and probably never will. In a flock of 70 hens, three or four were found, we are told, that never *had* and never *would* lay an egg. The stupid farmer (and, very likely, poultryman, that *thought* he was up-to-date) bought grain for such hens, and kept them year after year, while he just *threw* away his money, or his corn and wheat, which amounts to the same thing. One large establishment in New York State, that I visited, tested their hens, by putting four in a pen. If they got four eggs a day, of course all four were laying hens. Trap-nests sort out the consumers and producers, to be sure, and make a *sure thing* of

it; but Hogan and Potter claim their secret does in a few hours what would require days and weeks of hard work. No doubt these inventions are valuable; but why in the world have we not, among all our poultry-journals, one with enough enterprise to get hold of this whole business, and discuss it openly, instead of letting these fellows parade and "peddle" their secrets as they have been doing year after year since 1904? There is a lot of other similar work *still* going on in the poultry business; for instance, asking enough money to buy a good-sized poultry *book*, for something printed on a slip of paper but little larger than a postal, or possibly a two or four page leaflet.

The beautiful catalogs now being sent out by the manufacturers of incubators and brooders contain a vast deal more information, free of charge, than you get from these chaps that take fifty cents or a dollar for a printed leaflet that costs them only a fraction of a cent. Of course, it is right and proper to get something for your inventions; but when you ask and take a dollar, give in return a decent-sized book that gives a lot of other valuable information.

CHICKENS WITHOUT A BROODER; NOT ONLY IN FLORIDA BUT AWAY UP IN NEW HAMPSHIRE.

Mr. A. I. Root:—I have read your Home paper in GLEANINGS for March 15, and I am going to offer you a suggestion from my long experience with poultry. I have raised hundreds of chickens with no other brooder than a common stone jug filled with hot water. I put the jug in an ordinary shoe-case, which I can buy for 10 cents here; put sand in the bottom of the box, and cover over the box a thickness of burlap, usually a bran-sack ripped open. Such a brooder will mother about 25 to 30 chicks. Sometimes I wrap burlap or old flannel around the jug and use the water a little hotter if the night is cold.

Our incubator holds 360 eggs, and this is the only brooder I ever use. I think it would beat a flatiron, even in Osprey, Fla. MRS. SUSIE A. HYDE.
Canaan, N. H.

MY STRAIN OF WHITE LEGHORNS $\frac{1}{4}$ GAME.

Friend Root:—You will notice (in the lot of poultry we are sending you) one old hen clucking. She *would* slip into the house and lay behind the front door; then she wanted to sit, and begged *so hard* that "Em" says, "Old lady, if you *will* sit, I want you to spread yourself," and gave her 20 eggs, and she hatched 20 chicks, 19 white. They are about like half-grown quails, rather small to wean. I send you 21 young hens and one young rooster besides the six old ones. Osprey, Tex., Nov. 20. I. T. SHUMARD.

The above report is from friend Shumard, as he sent my chickens up here to Braidentown. If they continue to hatch 20 chickens from 20 eggs I shall be very glad.

A REMEDY FOR "GRIP;" GOD'S MEDICINES, ETC.

Mr. A. I. Root:—I have often thought of writing you a personal letter when reading your Home talks, as I enjoy them so much.

I have all my life worked outdoors, and have slept in one of those log cabins where it was ventilated in spite of us. I have had very small doctor's bills. I believe ten dollars would pay every particle of doctor and drug bills for the past ten years. I generally trap in winter, and have often waded the stream when the ground was covered with snow. It's better for grip than hot tea or ginger stew and whiskey.

Rocky Mount, Va.

J. B. OVERFELT.

Clearing Sale!

**SPECIAL PRICES ON ROOT'S GOODS,
Such as have Never been Offered Before.**

In place of a New Year's gift to our friends and patrons we are going to offer something special which we have hitherto never been able to offer.

We have an immense stock—a warehouse 40x250 feet filled with The A. I. Root Co.'s make of bee-keepers' supplies of every description, and on many articles we are overstocked. A number of articles have advanced in price; but we bought this stock before the advance, and are going to offer some, on which we are overstocked, at remarkably low prices for cash with order. This offer will be good only until January 15, or so long as the stock lasts. The following is a list of the special prices. At the left you will find the designation as given in our catalog. Orders must be given in lots of 5, 10, or multiples thereof.

2P 8-frame supers with plain section-holders, fences, bevel cleats, and springs for 4¼-in. plain sections, 33c each.
2P 10-frame with plain section-holders, fences, bevel cleats and springs for 4¼-in. plain sections, 37c each.
4P 8-frame plain section-holders, fences, bevel cleats, and springs with 4¼-in. plain sections and foundation starters, 49c each.
4P 10-frame shallow supers with plain section-holders, bevel cleats and springs with 4¼-in., 54c each.
2M 8-frame Danz. supers with hanger-cleats, Danz. section-holders, M fences, springs, cleats, and wedges for 4½-in. plain sections, at 46c each.
2M 10-frame Danz. supers with hanger-cleats, Danz. section-holders, M fences, springs, cleats, and wedges for 4½-in. plain sections, at 49c each.
Shallow frames for supers holding 4¼x4¼-in., \$1.60 per 100.
Shallow frames 5¼-in., for Ideal supers holding 4x5 sections, at \$1.60 per 100.
2I 8-frame deep or Ideal supers with slat and T fences, 33c each.
4I 8-frame deep or Ideal super, with sections and foundation starters, 49c.
4S 8-frame shallow supers with beeway sections, 4¼x4¼x1½, and foundation-starters, 49c each.
Danzonbaker brood-frames, \$2.25 per 100.
2S 8-frame supers with section-holders, separators, followers, and springs, for 4¼-in. beeway sections, 33c each.
2S 10-frame supers with section-holders, separators, followers, and spring, for 4¼-in. beeway sections, 37c each.
2L 10-frame deep supers with slats and I fences, at 37c.
4S 10-frame shallow supers with beeway sections 4¼x4¼x1½, and foundation starters, 54c each.
Dadant uncapping-cans, \$7.55 each.
No. 4 Novice extractors, \$7.55 each.

German wax-press, \$11.00 each.
2I 10-frame deep or Ideal supers, with slats and I fences, 37c each.
4M 10-frame supers with hanger-cleats, Danz. section-holders, M fences, springs, cleats, wedges, sections, and foundation starters, 66c each.
10-frame empty Danz. bodies, at 31c each.
Sections, No. 2 plain, 3¼x5x1½ in., \$3.35 per M.
Sections, No. 2 plain, 4x5x1½ in., \$3.25 per M.
Sections, No. 1 plain, 4x5x1½ in., \$4.00 per M.
J5 10-frame Jumbo bodies, with frames, 71c each.
Alley queen and drone trap, 40c each.
12-in., 4 row shipping-cases with 3-in. glass, \$17 per 100.
9¼-in., 4-row shipping-cases with 3-in. glass, at \$15 per 100.
10-in., 2-row shipping-cases with 3-in. glass, at \$9.35 per 100.
6¼-in., 3-row shipping-cases with 3-in. glass, at \$9.80 per 100.
7½-in., 3-row shipping-cases with 3 in. glass, at \$10.70 per 100.
Hubbard section-presses, \$2.00 each.
No. 17 Cowan reversible extractor, \$11.75 each.
A B C of Bee Culture, 1905 edition, by express or freight, 85c each; same by mail, \$1.10.
C 10-frame combination bottom-board with hive-stand, 23c each.
C 8-frame combination bottom-board with hive-stand, 21c each.
Besides the above we offer second-hand hives and supers taken as pay from a bee-keeper who overbought, most of the supers having been set on the hives only a short time. All are well painted, clean, and in good condition.
8 10-frame shallow supers with frames nailed and painted, 40c each.
Ae5 10-frame one-story hives with body, bottom-boards, covers, and frames, nailed and painted, \$1.10.

In ordering these goods mention Gleanings.

We have a complete line of the Weed New-process comb-foundation machinery, and are prepared to work up wax by the pound, or exchange foundation for beeswax. Our foundation is as good and perfect as money can buy, and rates are reasonable. Write for rates, stating the amount of wax you have. We also buy honey and beeswax in any quantity for cash.

Remember we have the largest and most complete foundation-factory and stock of bee-supplies in the South, and our prompt and careful attention is not excelled anywhere. We have been in the bee and supply business all our lives, and know the needs of the bee-keepers, so why not send your orders to us?

We want to secure a live hustling representative in every county in Texas, where we are not now represented. We prefer a bee-keeper centrally located, and one able to pay cash down for the goods he will order and carry in stock. To those who mean business we offer good inducements.

UDO & MAX TOEPPERWEIN

ORDER NOW—PRICES MAY GO HIGHER

LUMBER IS DEARER, AND LABOR HAS NEVER BEEN SO HIGH

WE offer you PRICE INSURANCE on BEE-SUPPLIES. Our plan does not cost you a cent; it may save you dollars. On all orders received before February 1, 1908, we will guarantee present prices (or less) to you, notwithstanding a contemplated advance in prices all along the line of bee-supplies. Shipments may be delayed until you want the goods. You can not lose. Write to-day. We make and keep in stock—Dove tailed Hives, Sections, Section-holders, Separators, Brood-frames, Foundations. Everything for the Bees—

YOUR MONEY BACK if not PERFECTLY SATISFIED.

Largest distributing center for raw materials, and best shipping facilities. Write for catalog.

MINNESOTA BEE-KEEPERS' SUPPLY COMPANY
21 NICOLLET ISLAND. (JOHN DOLL & SON, Props.) MINNEAPOLIS, MINN.

TO THE BEE - KEEPERS OF CANADA.

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the QUALITY. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, The best is cheapest."

**IRON AGE**

Get the FREE BOOK "EASY DIGGING" today and learn about the wonderful fast-digging Iwan Post Auger that bores right into the hardest clay or gumbo. Works equally well in dry or wet soil. Easiest Auger to unload. Saves cost in two days. Makes post setting a snap.

**THE IWAN AUGER**

is made on the only successful, scientific principle. Has sharp double blades of hardest steel. Digs twice as fast as any other Auger. Money back if it doesn't "make good." Write this very day for "Easy Digging" to  
**IWAN BROS., Dept. R, STREATOR, ILL.**

# We Sell You Doors 80¢ ALL HIGH GRADE AND AT HALF YOUR LOCAL DEALER'S PRICES

# Windows 66¢

If you have any use for Doors, Windows, Screens, Sash, Stair Posts, Mouldings, Porch Brackets, Columns or any kind of Millwork for your own buildings or as a contractor, don't buy elsewhere until you write us for our illustrated catalog. It quotes you at least 50 per cent lower prices than your local dealer or any retailer or "mail-order" house possibly could, as we have the Largest Building Material Plant in the World.

We sell our Millwork only direct to the user. We ship anywhere in the United States and guarantee to make you a clean saving, freight included, of from 25 to 60 per cent on anything you order.

Just send us a postal with your name and address and we'll promptly send, postpaid,

Grand Building Catalog **FREE**

showing everything in the latest styles of High Grade Millwork at lower prices than you have ever thought possible.

You can get an idea by the few illustrations and prices in this small space of what a saving you can make by buying from our catalog, but you must see the catalog to fully appreciate this selling plan of ours direct to you.

Do not think of buying until you get our estimate.

Our work is all Guaranteed strictly up to the Official Grades adopted by the

Sash, Door and Blind Manufacturers' Association of the Northwest, and if not exactly as represented in every particular, you can ship your order back at our expense.

Our lumber is first air-dried and then put through a scientific drying process. Joints are made with heavy hardwood dowel pins, glued with imported glue, pressed together by heavy steam-power press. There is no "come apart" to our work.

Remember, you save 50 per cent, freight included, on your Local Dealer's prices.

We operate the largest plant in the world—123,000 feet of floor space (four acres)—have been in business since 1865—own our timber lands, saw-mills and lumber yards.

We carry a large stock and can therefore ship promptly.

We have no traveling men—sell only for cash. We are the only large manufacturers of sash, doors and blinds selling direct to the consumer. Our prices will astonish you. Don't buy anything in our line until you get our catalog, the grandest woodwork catalog published.

Your banker, or any banker in Davenport, Iowa, your home, will satisfy you that we are thoroughly responsible. Our catalog will explain everything to you. Write for it today. You will receive it by return mail, postpaid.

## HARDY EVERGREENS **FREE** BLIZZARD BELT KIND

To prove that our EVERGREENS are HEALTHY, HARDY and Vigorous, we offer to send SIX fine two-year-old trees, entirely FREE OF CHARGE, to every property owner who will answer this advertisement. Mailing expense 5 cts., which send or not, as you please. A postal will bring them and our catalogue which contains many COLORED PLATES of our BLIZZARD BELT FRUITS; SPECIAL BARGAINS and a mine of valuable information for fruit growers. We want to become acquainted with you, and it will pay you to get into touch with our HARDY "BLIZZARD BELT" stock and our liberal manner of doing business. THIRTY-EIGHT years' experience in growing HARDY "BLIZZARD BELT" trees. Write to-day.

THE GARDNER NURSERY COMPANY,

Drawer 26.

Osage, Iowa.

## TWO MONEY MAKERS

**SCARFF'S SMALL FRUITS**  
 and bees are an ideal combination for bee-keepers or farmers. Order early and plant a generous quantity of these fruits. The bees pollinize them, making them produce in luxurious abundance, and at the same time increase amount and value of honey.

**3 Blackberry Bushes Free.** I want to prove how well-rooted, strong and vigorous my plants are. I will send free 3 fine blackberry plants, if you write for my new 1908 free catalog. Some of my customers are making over \$350 an acre with my plants. With bees you can increase that profit considerably. I sell a large variety of nursery stock, grown on an 800 acre farm. Write me to-day.

W. N. SCARFF, New Carlisle, Ohio

## The tools that increase results

No other farm or garden tools do such good work or so much work in so short a time, as Planet Jrs.

Strong and easy-running. Practical and lasting, and thoroughly guaranteed.

No. 25 Planet Jr Combined Hill and Drill Seeder, Double Wheel Hoe, Cultivator and Plow opens the furrow, sows the seed accurately in drills or hills, covers, rolls, and marks out next row in one operation. A perfect Double Wheel Hoe, Cultivator and Plow.

No. 8 Planet Jr Horse Hoe and Cultivator will do more things in more ways than any other horse hoe made. Flows to or from the row. A splendid hiller; no equal as a cultivator.

Write today for our new illustrated catalogue of 1908 Planet Jrs—45 kinds—a tool for every gardener's need.

S L Allen & Co    Box 11065    Philadelphia Pa

# PLANET JR.

## MORE EGGS—LESS FEED

By feeding green bone you can save enough money to buy a **Green Bone and Vegetable Cutter** besides doubling your egg yield. It's the only open hopper bone-cutter; simplest made; only three working parts; nothing to get out of order; no springs to adjust. Sold on a positive guarantee to cut more bone, in less time, with less labor and in better shape than any other bone cutter, or your money back.

**Free Trial** if you want it. Send to-day for handsome poultry book. Address,  
**HUMPHREY, Mine St., Factory, JOLIET, ILL.**

The HUMPHREY RAPID CLOVER CUTTER cuts more rapidly, more easily and finer than any other. Ask about it.

## DOUBLE YOUR EGG YIELD

Fresh, raw, green bone contains over four times as much "protein" and other egg-making materials, as grain. It takes the place of worms and bugs in fowls' diet; that's why it gives more eggs—greater fertility—stronger chicks—earlier broilers and layers—larger-market fowls, and bigger profits. You can cut it most easily, rapidly and best with **Mann's Latest Model BONE CUTTER**. Automatically adapts cutting to your strength. Never clogs. Cuts all adhering meat and gristle. We send it on **10 DAYS FREE TRIAL**. No money in advance. Catalogue free.

F. W. MANN CO., Box 37, Millford, Mass.

## Get Johnson's Old Trusty

Incubator Book; save money on your incubator and be sure of success. Simplest, most automatic incubator made. Runs itself and pays for itself. Takes less oil. 75 per cent hatches guaranteed.

**Sold on 40, 60 or 90 Days Trial**

Freight prepaid. More than 100,000 in use. Send today for big free book. It will help you. 176 pages—every page a poultry sermon, 300 pictures. Write today for Johnson's prices and guarantee.

**H. H. JEPSON,**  
182 Friend St. Phone Haymarket 1489-1

**W. H. Laws says,** If there is a queen-breeder who can boast of better stock let him trot out the proof. Testimonials enough to fill this book. Will give you only one. Mr. J. C. King, Washington, D. C., writes, "For two years I have had one of your queens in my apiary. Each season she has given me over 200 lbs. comb honey; last season she actually stored while other colonies starved. I have over twenty strains in my three apiaries, but yours is the best."

Now is the time to get a fine breeding queen; stock up this fall and double your crop of honey the coming season. Single queen, \$1.00; 6 for \$5.00. Extra select breeders, \$5.00. Safe arrival and satisfaction guaranteed.

**W H LAWS, Beeville, Bee Co., Texas.**

## PORTER BEE-ESCAPES

### HIVE ESCAPE

When taking off surplus this is the greatest saving device. It does away with the shaking of the heavy supers, the cruelty of excessive smoking which causes the bees to uncup their honey and start robbing. You can as well afford to be without a smoker as without the Porter Bee-escape.

PRICES—Each, 20c; dozen, \$2.25; postpaid. With board, 35c; 10, \$3.25; by express or freight.

### HOUSE ESCAPE

To be used over the doors and windows in the extracting-house, or any place you wish to clear of bees. Some bee-keepers make a practice of taking off the filled supers and stacking seven or eight in a pile. The Porter Honey-house mounted on a board makes the best kind of escape.

PRICES—Each, 25c; dozen, \$2.75; postpaid.

**For Sale by Dealers Everywhere!**

## How to Keep Bees

By Anna Botsford Comstock

228 pages. 32 pages of illustrations.

A charmingly written manual describing clearly and in detail the outfit, first steps, and methods. The author's well-known literary ability has combined with her enthusiasm for a subject to produce a very unusual volume. It is a handbook for those who keep bees for happiness and honey, and incidentally for money. It serves as well as an introduction to the more extended manuals already in the field. "Finally with all due deference to the authors of the excellent books on bee culture which we have already, my opinion is that this new book, 'How to Keep Bees,' is the best one for a beginner, or one who does not wish or expect to keep more than a dozen colonies, that has yet come before the world."—A. I. Root, in *Gleanings*, July 1, 1906.

Chap. 1, "Why Keep Bees," urges honey, perhaps money, recreation, love of nature study, and the need of bees in "a perfect garden," as good reasons for keeping bees. The second chapter tells "how to begin" in a small way, and we may get all the necessary detailed information for management from later chapters, arranged in order of demand for information.

Price \$1.00. Postage 10 cents extra.

Money refunded to any dissatisfied purchaser.

**The A. I. Root Co., Medina, O.**

# "Root Quality"

This phrase means that for selection of material, excellence in workmanship, and up-to-date methods, Root's goods are unequalled. Bee-keepers are learning the advantage of using first-class goods only, and that poor stock is dear at any price.

## MUELLER & YOUNG GRAIN CO

SUCCESSORS TO H. MUELLER &amp; CO.

SPECIALTIES: BARLEY AND OATS

TEL. HARRISON 2795

A. I. Root Co.  
Medina Ohio.

Chicago June 12<sup>th</sup> 06.

Gentlemen, I have just finished unpacking the last box of supplies and must say they are very satisfactory. The frames especially are extra fine, and I am just wondering how I was so foolish as buy the thousands I already have from that other firm. After seeing yours I have made up my mind that I would much rather buy yours than take theirs for a gift. This is no jolly but the simple truth.

Very truly Yours

James Tough  
1013 Clarence Ave  
Oak Park  
Ill.

This stands for  
Root Quality.

Mr. Tough's opinion of the Root-Hoffman frames is a representative opinion of thousands of bee-keepers all over the world who have used with profit and satisfaction Root's goods which have been on the market for more than thirty years.

"Root Quality" embraces a full line of Bee-keepers' Supplies, including hives, section honey-boxes, Weed-process comb foundation, Root and Cowan honey-extractors, Root smokers, perforated zinc, comb-foundation machines—in fact, every item required in the bee-yard or honey-house.

For full particulars regarding prices, stocks carried, or any other matter relating thereto, address the Root agents, branch offices, or the manufacturers.

THE A. I. ROOT COMPANY, ❖ ❖

MEDINA, OHIO

QUIRIN-THE QUEEN-BREDER, Bellevue, O

ANGEL'S GOLDEN BEAUTIES and his bright three-banded Italian Queens have but few equals and no superiors. A fine large queen of either strain for \$1.00; an extra select breeder for \$2.50. I have had 12 years' experience at queen-breeding. Address

SAMUEL M. ANGEL, Route 1, Evansville, Ind.

To those who may not care to make up a wire cloth cage, as shown on page 33 of this issue, we would state that we are prepared to furnish it in a neat shipping-case, with lid and hasps all complete, for \$12.00.

A line received too late for insertion in their full-page advertisement (see page 45) from Udo and Max Toepferwein requests our Texas subscribers to watch their advertisement in Jan. 15 GLEANINGS for the announcement of an introducing comb foundation sale.

#### NEW HONEY-JAR.

We have found a new honey-jar which is not only neat in appearance, and seals tight, but is lower in price than any of the jars listed in catalog. We shall have it in ½-lb. and 1-lb. size. The mold for the 1-lb. size is not yet ready, and we shall not have the jars in stock for some weeks. We have a few of the ½-lb. size. We can mail a sample for 15 cts. to pay packing and postage.

#### SECOND-HAND FOUNDATION-MILLS.

We have to offer the following second-hand foundation-mills in good condition. We shall be pleased to hear from any one interested. To such we can send a small sample of comb foundation representing the kind of work produced by the particular machine you enquire about.

No. 078.—6x2¼-inch hex. cell thin-super mill, in very good condition. Price \$12.00.

No. 079.—6x2¼-inch hex. cell thin-super mill, in very good condition. Price \$12.00.

No. 088.—6x2¼-inch hex. cell thin-super mill, in good condition. Price \$12.00.

No. 088.—6x2¼-inch hex. cell extra-thin-super mill, in good condition. Price \$12.00.

No. 088.—12x2¼-inch round-cell heavy-brood mill, in fair condition. Price \$12.00.

No. 082.—10x2¼-inch round-cell medium-brood mill, in very good condition. Price \$15.00.

No. 090.—10x2-inch round-cell medium-brood mill, in fine condition. Price \$15.00.

No. 091.—10x2-inch hex. cell, medium or light brood mill, in good condition. Price \$15.00.

#### GERMAN EDITION OF THE A B C OF BEE CULTURE.

We find when we get all our figures together that the production of the A B C in German is a bigger expense than we anticipated, and that \$2.00 each for the paper-bound edition does not cover first cost to us, even if we could sell every copy for cash at the full retail price. Compared with other works of like size and nature of contents the price ought to be \$5.00 per volume; but we know very well that very few would buy at that price. To make the price reasonable, and at the same time bring us somewhere near first cost, we will ask \$2.50 postpaid for the cloth-bound edition and \$2.00 for the paper-bound. When shipped with

other goods by freight or express, 20 cents may be deducted, if any of our readers know of German friends who do not read English readily, and would like to read the A B C in their native tongue secure their order for the book at the above prices, and for 50 cts. additional we will send GLEANINGS one year to your address or any other to which you may prefer to have it sent.

#### EARLY-ORDER CASH DISCOUNT.

We have been obliged to cut down the early-order cash discount below that offered in former years; but it is still sufficiently liberal to pay transportation charges quite a distance, or to pay liberal interest on the money invested in supplies early, and should attract those forehanded people who know pretty well what they want for the coming season.

The following is the schedule of discounts for early cash orders for bee-keepers' supplies, subject to the conditions below:

|                                  |              |
|----------------------------------|--------------|
| For cash sent in January, deduct | 3½ per cent. |
| " " " February, "                | 3 "          |
| " " " March, "                   | 2½ "         |
| " " " April, "                   | 2 "          |

The discount is only for cash sent before the expiration of the months named, and is intended to apply to hives, sections, frames, foundation, extractors, smokers, shipping-cases, cartons, and other miscellaneous bee-keepers' supplies. It will not apply on the following articles exclusively; but where these form no more than about one-tenth of the whole order the early-order discount may be taken from the entire bill: Tinned wire, paint, Bingham smokers, Porter bee-escapes, glass and tin honey-packages, scales, bees and queens, bee-books and papers, labels, and other printed matter, bushel boxes, seeds, and other specialties not listed in our general catalog.

#### Convention Notices.

The Wisconsin State Bee-keepers' convention will be held at the Capitol, Madison, Wis., Feb. 5 and 6. President N. E. France promises several good papers and an abundance of questions. The special features of the Wisconsin convention have always been the friendly and social intercourse among its members, and the profitable and instructive questions and answers of special interest to bee-keepers. Everybody is cordially invited to be with us.

GUS. DITTMER, Secretary.

The New Jersey State Bee-keepers' Association will meet in annual session at the State House, Trenton, N. J., on Saturday, January 11.

#### PROGRAM.

10:00 A. M.—Roll-call and business session.  
10:15.—Address by the President.—Bees and blossoms.

# These Two Business Brain-Partners

**FREE  
to  
You**

**If You Want To Know How To**  
advertise—prepare business letters—read  
proof—buy office supplies—manage a fac-  
tory—handle accounts—employ labor—  
dress windows—sell by mail—form a part-  
nership—draw up hole-proof contracts—  
**If You Want—**  
postal information—shipping rates—busi-  
ness formulas—tables of interest—patent  
laws—copyright laws—Wall Street terms.  
If you want to know anything about  
business, consult these two books.

A set of these books on your desk is almost equivalent to a corps of business experts on your payroll.

—to counsel you in every business move

—to give facts, statistics, working data, legal information and past experience on every plan or project

And to give you all this without a penny of cost

No man need go wrong on a legal matter, a sales plan, the selection of employees, machinery, paper stock, printing inks, business supplies, if he has this set of books at hand. It contains, in all, 9,408 useful and important facts on business, covering every branch, department and man in a retail, wholesale, manufacturing, banking or specialty concern. It tells how to ship goods at the lowest rates, how to read proof, write advertising copy, and install an inquiry follow-up.

It tells how to be your own attorney and settle your own legal tangles without paying an attorney's fat fee. It contains condensed correspondence courses on a full baker's dozen of vital business subjects such as window dressing, show-card writing, salesmanship, business law, bookkeeping, systematizing—really the boiled down essence of the best stuff on business ever written—condensed into "meaty" little chapters for your leisure study and ready reference. A complete and simple index.

## SYSTEM THE MAGAZINE OF BUSINESS

forth for your benefit the start a new business, how to keep down expenses, stop losses. Better, SYSTEM will show you how to make more in your present daily work. SYSTEM has 300,000 readers. It has helped many of them to better salaries, bigger profits, that would have been impossible, undreamed of without SYSTEM. Both proprietor and clerk can learn more and earn more through SYSTEM.

From a leading New York merchant:

"System is essential to business success and so is SYSTEM the magazine. No business can succeed without system—no business man can get along without SYSTEM the business magazine."

Samuel Brill, of Brill Brothers

From a Chicago Manufacturer.

"The value of SYSTEM can never be accurately estimated. By direct instruction, by timely suggestion it turns many a life and business man into better, more profitable channels."

Alexander H. Revell, of A. H. Revell & Co.

**Special Offer:** Merely send \$2 with the coupon. We will enter your name for a year's subscription to SYSTEM and will send you free of all cost a handsome two-volume set of the Business Man's Encyclopedia bound in substantial red vellum cloth. Or better still include a dollar extra—\$3 in all—and we will bind the volumes in the finest flexible English Morocco—and gold the edges. There is no leather so handsome, so strong, so dignified and so satisfactory as the genuine English Oxford Morocco. This leather will stand the wear and tear of years.

**SYSTEM** I enclose \$\_\_\_\_\_

for which please enter my name for one year's subscription to SYSTEM, beginning with the current number and send me without extra charge, all transportation charges prepaid, a set of the Business Man's Brain Partners bound as per your offer.

# DEEN LOOM

**QUICK PROFITS**

## Flying Shuttle

**W**HY not put your spare moments to work bringing in extra cash? Some people in your town are waiting for some one to make up their rags into carpets, rugs and portieres.

It's genteel, honest work that any man or woman can do and make good profit at it. Just to prove it, here are the names and addresses of fifteen out of hundreds of people who have woven carpets and rugs at a good profit. They use a Deen Loom.

### Good Profits Made At Home

Mrs. C. R. Stover, Bradford, Ohio  
Oma Cooper, Dale, Indiana  
R. P. McGowan, Piedmont, W. Va.  
Mrs. Rob. Record, Seymore, Illinois  
Mrs. Henry Clark, St. Anthony, Iowa  
Mrs. A. L. Clark, Central Square, N. Y.  
Mrs. H. C. Blahnet, New Lathrop, Mich.  
Mrs. T. E. Alley, Sylvan Grove, Kansas  
Mrs. O. E. Albin, Kearney, Nebraska  
Mrs. H. Goebel, West Point, Iowa  
Mrs. J. S. Gilbert, Milton Junction, Wis.  
Mrs. L. E. Foster, Bedford, Indiana  
Mrs. Salanda Gunckel, Osgood, Ohio  
Mrs. D. E. Williams, Pickering, Missouri  
M. H. Vining, Waterloo, Iowa

Remember these are only fifteen of scores and hundreds who at this moment are hustling out work and getting good money for it.

### You Who Read This

Haven't you often wished for a useful employment by which to make money in your spare hours? No doubt you know of people who would gladly pay you for weaving their rags into carpets and rugs.

It's not only the poorer people that have hand-woven carpets and rugs on their floors, but well-to-do people of city, village and country-side appreciate the handsome and useful products of home-weavers.

By canvassing among your friends you can work up a good business. Profitable, too. Besides, it's done at home with the children, where you can have an eye on everything in house and yard.

### It's Not Hard Work

Weaving with a Deen Loom is soon learned. The Loom itself is a simple affair, easily handled, and soon understood. May Vitum, Barclay, Kansas, says:

"I can weave almost twice as much as I could with the old loom. I would not go back to the old one for anything. The new one is faster, easier, and does the best work."

Having a steel frame well-braced, and rigid, it resists the shock and stroke of the shuttle mechanism, remaining solid for years without repairs.

It will accomodate any size rug or carpet demanded.

### What May Be Woven

Any design can be made in any number of colors that taste and fancy may dictate. You can weave rugs, hammocks, all kinds of hand-weaves, carpets, portieres, etc. The materials to use are common carpet warp which can be purchased of any dry goods store; carpet rags, old clothes of any kind, old ingrain and brussels carpets, blankets, or nearly any kind of fabric. Your customers furnish you all material; you do the weaving and get good pay for it.

### A Few Prominent Reasons for Buying

- 1.—You can make from \$2 to \$3 a day if you weave 8 hours daily.
- 2.—You can make from \$4 to \$10 a week using only part of your time—say evenings after work and an hour in the morning.
- 3.—We help you personally by letter if you wish. But this is seldom necessary, because we send you simple, detailed instructions with pictures of the loom and its parts. This book makes everything plain. You have no real difficulty in handling the loom.
- 4.—The Fly-Shuttle is easily filled, quick to handle, doesn't bother.
- 5.—The Winding Mechanism and Feed-Governor are new improvements. The latter keeps the warp and weft mechanism within control. It saves much material and prevents hours of thrown-away time used by old-style looms.
- 6.—It takes up much less room than many other styles. It requires a room but 10 feet square for a complete weaving shop.
- 7.—We send you everything with the Loom. You can go right to weaving as soon as you get warp and rags.

### You Needn't Pay All At Once

Pay something down. As Loom brings in profits send balance by easy installments. Fill in the coupon and mail. We'll send our free catalog and a letter about our easy-pay plan.

Mrs. D. E. Williams, Pickering, Missouri  
M. H. Vining, Waterloo, Iowa

Remember these are only fifteen of scores and hundreds who at this moment are hustling out work and getting good money for it.

### You Who Read This

Haven't you often wished for a useful employment by which to make money in your spare hours? No doubt you know of people who would gladly pay you for weaving their rags into carpets and rugs.

It's not only the poorer people that have hand-woven carpets and rugs on their floors, but well-to-do people of city, village and country-side appreciate the handsome and useful products of home-weavers.

By canvassing among your friends you can work up a good business. Profitable, too. Besides, it's done at home with the children, where you can have an eye on everything in house and yard.

### It's Not Hard Work

Weaving with a Deen Loom is soon learned. The Loom itself is a simple affair, easily handled, and soon understood. May Vitum, Barclay, Kansas, says:

"I can weave almost twice as much as I could with the old loom. I would not go back to the old one for anything. The new one is faster, easier, and does the best work."

Having a steel frame well-braced, and rigid, it resists the shock and stroke of the shuttle mechanism, remaining solid for years without repairs.

It will accomodate any size rug or carpet demanded.

### What May Be Woven

Any design can be made in any number of colors that taste and fancy may dictate. You can weave rugs, hammocks, all kinds of hand-weaves, carpets, portieres, etc. The materials to use are common carpet warp which can be purchased of any dry goods store; carpet rags, old clothes of any kind, old ingrain and brussels carpets, blankets, or nearly any kind of fabric. Your customers furnish you all material; you do the weaving and get good pay for it.

### A Few Prominent Reasons for Buying

- 1.—You can make from \$2 to \$3 a day if you weave 8 hours daily.
- 2.—You can make from \$4 to \$10 a week using only part of your time—say evenings after work and an hour in the morning.
- 3.—We help you personally by letter if you wish. But this is seldom necessary, because we send you simple, detailed instructions with pictures of the loom and its parts. This book makes everything plain. You have no real difficulty in handling the loom.
- 4.—The Fly-Shuttle is easily filled, quick to handle, doesn't bother.
- 5.—The Winding Mechanism and Feed-Governor are new improvements. The latter keeps the warp and weft mechanism within control. It saves much material and prevents hours of thrown-away time used by old-style looms.
- 6.—It takes up much less room than many other styles. It requires a room but 10 feet square for a complete weaving shop.
- 7.—We send you everything with the Loom. You can go right to weaving as soon as you get warp and rags.

### You Needn't Pay All At Once

Pay something down. As Loom brings in profits send balance by easy installments. Fill in the coupon and mail. We'll send our free catalog and a letter about our easy-pay plan.

## Honey Markets.

### GRADING RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**A No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

The prices listed below are intended to represent as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct, to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent) cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

**CHICAGO.**—Within the last few days an unexpected amount of comb honey has come on this market in addition to small consignments from adjacent territory that became quite frequent in December. Three carloads of Western comb have come on consignment, part of it to firms that do not make a specialty of honey, so that, when a buyer appears, he is able to get concessions that are chiefly limited to what he will pay. On choice white grades, 16 cts. is asked, with little demand for any of the off lots, which are difficult to sell at from 1 to 5 cts. per lb. less. Extracted, white, 8 to 9; ambers and dark, 6 to 7. Beeswax, 28.  
R. A. BURNETT & CO.,  
Chicago, Ill.

**INDIANAPOLIS.**—Demand for best grades of extracted honey is good, while the demand for comb honey is not so brisk. Very little honey is being offered by producers at present. Jobbers are offering the following prices, delivered here. No. 1 and fancy comb, 16 to 17, net weight; extracted white clover, 9 to 10. Beeswax, 28 cash or 30 in exchange for merchandise.  
Jan. 4. WALTER S. POWDER, Indianapolis, Ind.

**CINCINNATI.**—The market on comb honey is very slow and quiet. No. 1 is selling, in a retail way, white clover from 16 to 17, Colorado alfalfa from \$3.75 to \$4.00. Water-white extracted honey, sage and clover, good demand, ranging from 9 to 10; amber extracted in barrels, slow from 6 to 6½. Beeswax is selling slow at 32.  
C. H. W. WEBER,  
Cincinnati, O.

Dec. 31.

**CINCINNATI.**—Owing to the unsettled condition of finance throughout the country, causing much uneasiness and anxiety among the buyers, we look forward to seeing honey reach lower values in the very near future. We are at a loss to say what prices we will ask in 10 days hence, but at this writing we are quoting extracted amber honey in barrels at 6 to 7½ cts.; fancy white extracted in 60 lb. cans, at 10; and strictly fancy white comb honey (which is moving slowly), at 16½ to 18, according to the quantity purchased. For choice yellow beeswax, free from dirt, we are paying 30 cts. per lb., delivered here.

Jan. 4.

THE FRED W. MUTH CO.,  
51 Walnut St., Cincinnati, O.

**ZANESVILLE.**—This market is still well stocked with honey, especially alfalfa. An occasional shipment of clover comb comes in from eastern and north-central States. The demand for honey, both comb and extracted, is still light, though it has toned up slightly since last report. No. 1 to fancy white comb would bring, first-hand, 15 to 16 cts. wholesale at about 17½ to 18. Extracted, in 60-lb. cans, is quoted at 11 to 12½, wholesale. Beeswax quiet. Would pay 30 cts. in exchange for bee-supplies f. o. b. here.

Jan. 7.

EDMUND W. PEIRCE,  
136 W. Main St., Zanesville, O.

**BUFFALO.**—The demand is improving a little for white comb honey. Not very much in dealers' hands here. Extra good demand for white extracted, quick sale on arrival. No. 1 fancy white clover comb, 16 to 17; No. 2, 13 to 15; No. 1 buckwheat, 11 to 12½; No. 2, 10 to 11. White clover extracted, 9 to 11; amber, 8 to 8½; dark, 7 to 8. Beeswax, 30 to 32.

Jan. 11.

W. C. TOWNSEND  
Buffalo, N. Y.

**ST. LOUIS.**—The honey market has been slow on extracted and comb honey, and is freely offered at the following reduced prices: Fancy white, 15 to 16; No. 1, 14 to 15; amber, 13 to 15, according to quality and condition. Broken and defective honey sells at considerably less. Extracted white, in cans, nominal, at 8 to 8½; amber, in cans, 7½ to 8; in barrels and half-barrels, ½ to 1c per lb. less. Granulated honey sells at about ½ cent per lb. less than liquid. Beeswax, 28c for choice pure. All impure and inferior, less.

Jan. 10.

R. HARTMANN PRODUCE CO.,  
St. Louis, Mo.

**KANSAS CITY.**—The receipts of comb honey are more liberal, and prices lower. The demand is light for both comb and extracted. We quote No. 1 white comb, 24-section cases, \$3.00 to \$3.10; No. 2 white and amber, \$2.75. Extracted, white, per lb., 8 to 8½ cts.; amber, 7 to 7½. Beeswax, 25 cts.

Jan. 10.

C. C. CLEMONS & Co.,  
Kansas City, Mo.

**SAN FRANCISCO.**—Honey moves very slowly at present, as high prices have curtailed the demand. With light offerings and few arrivals of new stock, prices are firmly maintained. Light amber, extracted, 7 to 7½; water-white comb, 16 to 17; white comb, 15; water white, extracted, 8 to 8½.—*Pacific Rural Press.*

# WHAT HAS MUTH GOT NOW?

Genuine  
Orange-blossom Honey.

Genuine  
Black-sage Honey.

Genuine  
White-clover Honey.

(All in crates of two 60-lb. cans each.)

and Fancy Comb Honey in 24-section cases, averaging 22 lbs. to the case.

You better write for prices; this honey is too good to stay long on our hands.

# THE JANUARY

*Bee-keepers' Review* comes as near being a "health number" as any issue yet printed, or that probably will be published. Health is

## The Foundation of All Success,

and two important points are covered in this issue. Many of our ills come from imperfect digestion, and C. W. Dayton, who has studied medicine as well as bee-keeping, points out a great cause of imperfect digestion and faulty assimilation, and tells how to make and use a drink, with honey as a basis, that will almost prove a cure-all for headaches, colds, neuralgia, and the many ills that result from indigestion.

Then there is an article from the pen of T. B. Terry, the potato-specialist, telling how he

## Cured Himself of Rheumatism,

without medicine—simply by changing his ways of living. Then, to make sure there was no mistake, he

went deliberately back to the old habits. The rheumatism returned, only to be cured again when he "reformed." Mr. Terry says that no one needs to have rheumatism if he lives right—and he tells how.

Then there are the usual practical, helpful, bee-keeping articles from such men as Atwater, Townsend, Bingham, and J. E. Hand. Yes, and Mr. Doolittle tells how to produce a crop of the most

## Fancy of Fancy Comb Honey

with no danger whatever from swarming.

There are still a few sets left of the back numbers for 1907 that will be

## Sent Free

if you send \$1.00 for the *Review* for 1908. For \$2.00 you can get these back numbers for 1907, the *Review* for 1908, and a copy of the book, *Advanced Bee Culture*. Book alone, \$1.20.

**W. Z. HUTCHINSON, :: :: :: FLINT, MICH.**

## At Just Half Price!

The *American Bee Journal*, which is now a 32-page monthly, in its 48th year, is the oldest bee-paper in America. It is only 50 cents, but you can have it at just half price (for 25 cents) when taken with any one of the following list of standard bee-books:

Dr. Miller's "Forty Years Among the Bees".....\$1.00  
"Langstroth on the Honey-bee".....1.20  
Cook's "Bee-keeper's Guide".....1.20  
"A B C and X Y Z of Bee Culture".....1.50  
"Amerikanische Bienenzucht" (German).....1.00  
"Bees and Honey" (Newman)......50  
Doolittle's "Scientific Queen-rearing"......50  
(Leatherette Binding.)  
"Honey-Money Stories" (68-page pamphlet) .25

Just add 25 cents to any of the above prices, and we will mail you both the book and the *Bee Journal* for one year. Sample copy of *Journal* free.

### FARM AND GARDEN LABOR-SAVERS.

The daily work of farmers, truckers, and market-gardeners isn't as hard as it used to be. The labor has been lessened, and at the same time results have been increased. A man can get more bushels of grain or truck from an acre of ground to-day than

he could a few years ago, and he doesn't have to work so hard to do it. The adoption of up-to-date methods in which the federal government with its experiment stations is aiding him, and the use of up-to-date tools, which the agricultural-implement makers have put on the market, combine to take away the greater part of the drudgery that was formerly a necessary part of agricultural effort. Along this line nothing has contributed

so much as the tools known as the "Planet Jr." These implements not only lighten and lessen farm work, but they save seed, time, and money.

The Planet Jr. tools for farm and garden have an established reputation for quality as well as efficiency, and they are popular everywhere. They are used as successfully in Egypt and other foreign countries as they are in all sections of our own land. They represent the most advanced thought and ideas in farm-implement making, and hardly a year passes without the introduction of some new device or improvement to increase their usefulness to the man who tills the soil.

S. L. Allen & Co., of Philadelphia, make the Planet Jr. tools, and they issue a handsome catalog describing them. You ought to have one of these catalogs, whether you think you need more tools or not. The book is generously illustrated with photo-

graphic scenes showing modern methods of farming and gardening as it is actually being done with the Planet Jr. tools. If you will drop a postal to S. L. Allen & Co., box 1106S, Philadelphia they will be pleased to send you one of these catalogs.

### Poultry Experts Show How to Make Money with Poultry and Incubators.

Every farmer and farmer's wife in this country should consider the great ready cash profits of raising poultry in the easiest and most economical, time-saving way, with incubators and brooders which have for 10 years demonstrated their superiority over the hen.

Poultry experts are absolutely agreed that the Cyphers Incubator Company's patented machines are the world's standard. Beginners—Experts and the Agricultural Experiment Stations are using Cyphers machines successfully and recommend them.

It will pay every reader of this paper to get the latest reliable facts on the poultry subject, by writing for the Cyphers Free 212-Page Catalog (8x11 in., larger than a magazine), which is most interesting in the decision of the subject of "How to Make Money with Poultry and Incubators."

The catalog contains hundreds of illustrations, and describes the full line of Cyphers Supplies—everything for the poultry raiser. This, the biggest and best book of its kind, is free to you if you name this paper and send name and address of two acquaintances interested in poultry. Address

Cyphers Incubator Company, Buffalo, New York, Boston, Chicago, Kansas City, Oakland, Cal., or London.

# \$500.00 ACCIDENT INSURANCE POLICY FREE!

## FARMERS' INSURANCE THAT REALLY INSURES.

You may have had other chances to buy accident insurance that would protect you in elevators, on steamboats, and automobiles, but this is the *first chance you have ever had* to get real protection in your ordinary work. This NEW \$500.00 POLICY was secured from the North American Accident Insurance Company, of Chicago, Ill., (Surplus \$331,498.66) the largest company in America handling this class of policies, after long negotiations. It took three months to induce the company to write the special features that were required to make it valuable for rural people. By buying the policies outright in very large quantities, it is now possible to offer it FREE with this remarkable practical combination of magazines.

GLEANINGS IN BEE CULTURE, \$1.00  
the bee-keepers' favorite paper,

FARM JOURNAL (five years), .75  
the standard farm paper of the world,

GARDEN MAGAZINE—FARMING, 1.00  
a most beautiful, practical horticultural magazine.

INSURANCE POLICY . . . 1.00  

---

\$3.75

## All for \$2.

These magazines, if paid for separately, would cost you \$2.75, but we can sell ALL THREE MAGAZINES with the NEW INSURANCE POLICY for ONLY \$2.00. This is because the three publishers have combined for a subscription campaign. If each one sent you a separate letter it would cost us just three times as much as where we offer all three together. **THE SAVING GOES TO YOU.**

If the policy is not wanted we can substitute any of the following: "Designer," "Housekeeper," "Ladies' World," "McCall's Magazine," "Mother's Magazine," or the Garden and Farm Almanac.

## WHY SHOULD YOU HAVE THESE PAPERS?

**BECAUSE** GLEANINGS IN BEE CULTURE is the great paper in America devoted to bees and honey. If you have bees, or are going to get them (and everybody who lives in or near the country should have bees), you need the most reliable and latest information, and you want at the same time the simplest directions possible. You want the bee business in a nutshell, and that is what GLEANINGS will give you. For the beginner or the most expert it is equally valuable.

**BECAUSE** FARM JOURNAL is far and away the foremost farm-paper in the world, a boiled-down, practical, helpful, entertaining monthly, built to make the rural homes of America more happy, prosperous, and contented, and already doing it for more than 500,000 homes. For farmers, villagers, or suburbanites.

**BECAUSE** the most beautiful garden and horticultural publication in the world is the GARDEN MAGAZINE, full of sound sense, beautiful engravings from photographs, and fine printing. It has ten issues at 15 cents each and two at 25 cents each, per year, and the subscriber gets his money's worth twice over. It is a delightful magazine, useful, stimulating, and ornamental.

## WHY SHOULD YOU HAVE THIS INSURANCE?

Because you are in danger, every moment, of an accident which may cripple you for weeks, months, or for life; because the loss of an eye, a hand, or a foot, may mean destitution for yourself and your family; because this protection, for a full year costs you nothing whatever.

### WHAT THE POLICY PAYS:

|                                                                                                      |          |
|------------------------------------------------------------------------------------------------------|----------|
| For Loss of Life                                                                                     | \$500.00 |
| For Loss of Both Eyes, meaning entire and permanent loss of the sight of both eyes.                  | 500.00   |
| For Loss of Both Hands, by actual and complete severance at or above the wrist.                      | 500.00   |
| For Loss of Both Feet, by actual and complete severance at or above the ankle.                       | 500.00   |
| For Loss of One Hand and One Foot, by actual and complete severance at or above the wrist and ankle. | 500.00   |
| For Loss of One Hand, by actual and complete severance at or above the wrist.                        | 125.00   |
| For Loss of One Foot, by actual and complete severance at or above the ankle.                        | 125.00   |
| For Loss of One Eye, meaning entire and permanent loss of the sight of one eye.                      | 50.00    |

Provided such loss shall result within thirty days from date of accident, from accidental bodily injuries, solely and independently of all other causes, and covers accidents as follows:

Being thrown from a mower by horses.  
Being knocked down in the road by a wagon or automobile.  
Being hurt in a bicycle accident or collision.  
Being hurt while operating corn-sheller, fodder-cutter, etc.  
Being caught in a burning building, house, or barn.

Being hurt in an elevator or any public conveyance—train, trolley, boat, etc.  
Being injured in a runaway.  
Being frozen or frostbitten.  
Being injured by robbers or burglars.

Should the Assured obtain injuries in the manner specified above, which shall not prove fatal, but which shall immediately, continuously, and wholly disable and prevent the assured from performing each and every duty pertaining to any business or occupation, the Company will pay the Assured FIVE DOLLARS PER WEEK during the time of such disablement, but not exceeding six consecutive weeks for any one accident.

## NO DELAY OR EXAMINATION.

The insurance goes into effect as soon as you receive the policy and mail back the coupon attached to it. There are no dues, taxes, premiums, or assessments of any kind whatever to be paid by you. We have paid everything in full.

The three papers will begin at once, and will come to you each month till the time expires. **THEN THEY WILL STOP**, unless you order them renewed.

Send us \$2.00 by registered mail, or postoffice or express money-order-to-day. Money refunded to any dissatisfied subscriber. Address

GLEANINGS IN BEE CULTURE, MEDINA, O.

## INDEX TO ADVERTISEMENTS.

|                                    |                                       |                                       |                                        |

*The A. I. Root Co.*:—Please take out my ad't. The machine is sold. Thanks for your kindness.

Crawfordsville, Ind., Jan. 10. W. H. KERR.

WANTED.—To exchange Cypher's incubator.

W. H. KERR, Crawfordsville, Ind.

Hundreds of our subscribers have articles, implements, etc., for which they have use no longer, which could easily be disposed of by a little adv't in our classified columns. Rates, 25 cts. per line per issue.

On page 74 appears the advertisement of a new firm located at Bangor, Maine. They handle Root bee-supplies and sell at factory prices, allowing all quantity and early-order discounts. They have fine shipping facilities and would be pleased to handle a trial order from you. Give special attention to their offer for the coming year concerning bee literature. Catalog and circulars will be mailed free upon request by Geo. S. Graffam & Bro., Bangor, Maine.

#### AN OLD RELIABLE SEED FIRM.

We have just received the annual catalog of that old reliable seed-house, D. M. Ferry & Co., Detroit, Mich. The cover pages are handsome color illustrations of scenes in Belle Isle Park, in Detroit. The firm of Ferry is so well known to all gardeners and farmers that it is almost a work of supererogation to make any remarks about them. Their trade extends from the Atlantic to the Pacific, and from Hudson's Bay to the Gulf of Mexico—and, in fact, further, for they send seeds to the islands of the sea. They do a large business in farmers' seeds for the vegetable-garden. In addition the farmers' wives also buy considerable quantities of flower-seeds for the proper adornment of the rural home. Some good housewives will have none but Ferry's seeds. When you send for their catalog, mention this journal.

#### THE "OLD TRUSTY" INCUBATORS.

One of the most reliable poultry concerns we know of is the M. M. Johnson Co., of Clay Center, Neb., who manufacture the well known Old Trusty incubators. One of the important features of these incubators is the California redwood of which they are made. This is one of the best furniture woods

known, having the striking advantage of not expanding with the wet atmosphere nor contracting with a dry one. It is, furthermore, a wood of great durability and beauty, being much used by piano-makers. Another valuable feature of this machine is the absence of the lever arm on top, which generally happens to be in the way, more especially when some person throws his overcoat or hat down on the incubator. It is also out of the sight of meddlesome children who are generally interested in incubators. These two features alone are surely sufficient to show that Mr. Johnson is no "chicken" at the chicken business, and that he is in earnest in trying to furnish his customers the very best machine that money can buy. He issues a nice catalog which is free for the asking. When you send for it, kindly mention GLEANINGS.

#### THE DETROIT DISC HARROW.

Disc machines are the order of the day in the farming world. Plows and harrows of this type are carrying all before them. Among the very best is the Detroit tongueless disc harrow advertised on back cover page. It certainly has features which appeal strongly to the practical man who is looking for something which will do his work with the least expenditure of force, time, and money. One of the prominent features of the Detroit is that it is tongueless. For this reason it is easier to handle and is less troublesome to the horses.

Another valuable feature is that the discs can be lifted up out of the way very readily and easily. This prevents dulling the discs when the machine is on the road going from one field to another, or to and from the barn and the land to be cultivated. Having no tongue it is easily handled among fruit-trees—something of a boon to fruit-growers. It is unnecessary for us to explain all the features of this harrow, because the manufacturers send free a book which fully explains all the main points of superiority. It is worth sending for.

The makers, The American Harrow Co., 468 Hastings St., Detroit, Mich., have branch-houses through which they ship to save freight. They also sell on the installment plan to suit the views of some patrons. Some of our foreign readers would probably find a perusal of their catalog very interesting. Send for a catalog and mention GLEANINGS.

# WE OFFER

**THE FOLLOWING LIST OF GOODS AT THE EXCEED-  
INGLY LOW PRICES TO CLOSE OUT OUR STOCK:**

80 Danz. 10-frame nailless covers, flat, and metal-bound at ends to prevent warping, at 15 cts. each.

### TO THE BEE - KEEPERS OF CANADA.

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the QUALITY. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, The best is cheapest."

## WE DO NOT SELL ROOT'S SUPPLIES

So many advertisers in GLEANINGS IN BEE CULTURE sell supplies bought from the Root Co. that to explain away a false impression we are compelled to state that we are not jobbers, but *manufacturers*. We make all the Bee-supplies we sell. Minneapolis is the largest lumber-distributing point in America. We buy lumber to advantage; we manufacture by water-power; we have lowest freight rates, and we sell on manufacturer's profit basis. **Let us quote you prices.**

### GOLD MEDALS

St. Louis Exposition, 1904  
Jamestown Exposition, 1907

IS THE BEST,  
STRONGEST,  
COOLEST,  
CLEANEST,  
CHEAPEST,  
AND LARGEST  
SMOKER SOLD  
FOR A DOLLAR

The perforated side grate seen above holds a removable, metal, asbestos-backed fire shell, preventing burning the tin off the outer case, and deflects the air at right angles, preventing back draft to the valveless bellows. The air, passing to the back and over the top, cools and expels the smoke, fanning the burning fuel at top or side till all consumed, giving cool smoke for hours from one filling. It can't clog. No top-heavy cap to choke with soot; no valve to fall; no holes shedding sparks or hot ashes.

Four years' sales prove its success beyond a doubt, expensive dies making it uniformly perfect as possible to devise. We confidently guarantee full satisfaction or refund the price.

Price, \$1.00; 3 for \$2.50; by mail, add 25c. each

Send address of yourself and Bee friends for 8-page leaflet on "Smoker," and facts about Bees and Queens, 80 pages, free.

## Nothing "halfway" but the Place= or, what is in a name, anyhow?

*By the Bee Crank.*

Not "halfway" satisfactory, but entirely satisfactory, and from a prosperous little town in Missouri, the State where folks have to be shown. I find, though, that there are bee-men in other States who are in need of being shown as well as those in Missouri. Try placing a trial order here, regardless of distance, and let me show you what I can do by way of accuracy, promptness, and finest quality of goods. The following whole-souled letter from Mr. Taft speaks for itself:

Halfway, Mo.  
*Mr. Walter S. Pouder:*—The goods are here, and every thing is all right—not a blemish on any thing. I never saw goods packed better. I am more than pleased, and the freight from Indianapolis to Bolivar was less than I expected. The honey and wax extractors are simply fine; and when I want more goods I know where to send.  
Truly yours, J. M. TAFT.

Incidentally, Mr. Taft's letter conveys a very strong suggestion to other bee-men regarding the place to order their supplies. Packing goods carefully and getting them to my customers in perfect condition is a matter of temperament with me. If there was any thing wrong it would worry me more than it did the consignee. I handle all sorts of bee-supplies, sell Root's goods at Root's prices, and it's only "halfway" as far from me to you as it is from any other point in the universe where you could buy your supplies.

I pay highest cash and trade prices for beeswax. Send it along by freight or express according to size of package.

Finest white-clover extracted honey in any quantity. Write for quotations. My illustrated catalog is free.

Vol. XXXVI.

JANUARY 15, 1908.

No. 2

A TABLESPOONFUL of honey, even measure, weighs  $\frac{3}{4}$  of an ounce — 24 spoonfuls to the pound.—*American Bee Journal*, 747.

POSSIBLY dividing a swarm into two or more parts at time of swarming, as given by Wm. M. Whitney, p. 37, has been given before; but I don't remember seeing it. Looks good.

J. E. HAND has the endorsement of the bees as to the best time to requeen an apiary, page 40; for, if I am not mistaken, nearly all their superseding is done about the close of the honey-flow.

A PROFIT of \$300 is figured for Mr. Howe for moving 100 colonies to the basswoods, p. 23. That's right, if absolutely nothing is stored in the home apiary during the time of removal. Otherwise the home surplus must be deducted from the \$300. [Here is a chance for a nice little conflag between Dr. Miller and G. M. Doolittle. If we knew how to egg on the fight we would do it. GLEANINGS will furnish the arena.—ED.]

SPLIT-TOP SECTIONS are mentioned, page 1557. When sections were first introduced they were all 4-piece, and did they not all have split-tops? Certainly I never saw any others for some time. The tops were not split in two entirely; a saw-kerf was cut in the under side, and then they were bent apart to receive the foundation. [You are correct that split tops were used with four-piece sections, but not exclusively. They were made both ways.—ED.]

"A SYRUP two parts of sugar and one part of water" for late feeding, p. 32. Wouldn't you rather have it just a bit heavier? All the syrup I ever fed late was  $2\frac{1}{2}$  parts sugar

to one of water, and it never seemed too thick. It may be well to remember that many excellent authorities in Germany strongly insist that continued sugar-feeding is at the expense of the stamina of the bees. [Possibly you are right, doctor, that a thick syrup given all in one feed should be two and a half to one. We shall be glad to get results of experiments on this point from our subscribers. See discussion by J. L. Byer on this subject in this issue.—ED.]

A CORRESPONDENT whose bees are now in the cellar wants to change the location of his apiary in the spring about half its length, leaving the east half on its old stands, and moving the west half east of this. He wants to know whether there will be any trouble from bees returning to their old location when thus placed in the spring. I think not; and, what's more, he will have no trouble if he puts each colony just where he likes when taken from the cellar, with no reference to its former location, as I have tried it a number of times.

STATE'S ATTORNEY HEALY, of Chicago, whose office has 15,000 or 20,000 criminal cases a year, says, "When you put the lid down hard on the liquor-traffic, or wipe it out altogether, then you can close half of your courts." [And he was quite within the limit of facts. Whenever the lid is put on hard, there is not much doing in the criminal courts. Only recently the lid has been screwed down on Sunday in Cleveland, and the newspapers have been commenting on the fact that the usual bums and toughs that come up before the criminal courts on Monday are conspicuous by their absence.—ED.]

ENDORING what Prof. Cook says, page 24, let me add that, if the bees of this country are ever brought to their highest development, it will not be so much because a few of the queen-breeders have done conscientious work, but because the rank and file all over the land have done what Prof. Cook commends. What John Smith, with ten colonies, ten miles distant, does with his bees may not seem of any interest to me, and yet in time it has its influence on the character

of my bees. A drop of water dropped in Lake Michigan at Chicago doesn't raise the level of the lake much ten miles distant, but it does raise it.

In 1880 Frank R. Cheshire was engaged as lecturer of the National Temperance League, and up to the time of his death he had delivered 2100 lectures in metropolitan schools, which were valued by the young people to whom they were addressed. — *British Bee Journal*, Oct. 11, 1894.

A friend calls my attention to the foregoing; and in these days, when such a wave of prohibition is sweeping over our land and other lands, it is pleasant to recall that one so prominent in the rank of bee-keepers should have used such an influence among the young folks who are now voters in the old country. I wonder, now, whether a greater proportion of prohibitionists may not be found among bee-keepers than among any other class, not even excepting ministers.

"WHEN THE MOTH is disturbed it moves with a jump and a flit, making it hard to catch," p. 21. Yes, hard to catch after it gets to jumping and flitting, but very easy before. Move the fingers slowly till within an inch or so of where the moth is sitting, then quickly make a dab, and you have it. Now something interesting to the youngsters. When you catch a moth, pull off its head; and if it is a female—nine times out of ten it will be one—it will almost immediately begin feeling around with its ovipositor. Shut together your thumb and finger, and let the ovipositor feel its way into the crack between them, and a very little round white egg will be laid there—perhaps several. [This is an interesting contribution to natural history. We do not remember to have seen it given before.—ED.]

"IN THE WELLS system there was no intermingling of the bees," p. 17. Did not the bees from both parts enter the same super, thus making an entire intermingling? [In most of the cases where the Wells system was illustrated and described in the *British Bee Journal*, the super was divided as well as the brood-nest, so there was no intermingling of bees as suggested by you. In one or two cases of the Wells system, however, the bees in the two divisions in the hive could mingle after they got into the super; but, apparently, the author of the system did not contemplate any intermingling of bees either in the super or brood-nest. We have lately been over the files of the *British Bee Journal*, and we are convinced there is a sharp distinction between the Wells system proper and the two queen system with perforated zinc.—ED.]

W. S. PANGBURN writes: "E. R. Root objects in the A B C to your tent-escape for supers, for the reason that the very young bees are unable to get back to the hive," and perhaps for that reason I find no mention of it in the 1908 edition. Please tell us on what ground you base your objection. [Your tent escape, doctor, was dropped for one embodying the same principle by W. M. Whitney.

As his modification we consider superior to yours, and as our space was cramped, we dropped yours and substituted his. Mr. Whitney's has the advantage that bees will come out of the supers because they do not have to travel from one super to another in order to find daylight. By consulting the Whitney bee-escape in our new A B C book, which escape was illustrated and described by the author on page 1150 for Sept. 1st last year, one will see more clearly why the change was made. With either escape it would be my opinion that some young bees will be lost.—ED.]

SR. PONS-FABREQUES, p 27, is threatened with lynching in Germany or Scotland for saying heather honey is of inferior quality. Certainly in Scotland; but wouldn't he be safe at least in parts of Germany? [At the risk of being lynched ourselves, we will state that a very fine section of heather honey was sent us from "Merrie England." Perhaps our tastes have been educated wrongly in this country; but of all the vile honey we have ever tasted, we should certainly put this at the head of the list. We have since submitted it to guests as well as to connoisseurs of honey; and the verdict of all of them alike was to the effect that it is an ill-flavored honey to say the least. Perhaps some of our British cousins may say this was not a good sample; but the correspondent who sent it said it was something extra fine in heather honey. If we were not familiar with the taste of buckwheat we probably would class it as bad as heather; but the very fact that some residents of the buckwheat country consider buckwheat honey the best honey sold, and that expert connoisseurs in England and Scotland consider heather honey the very finest that is produced, it shows that there is every thing in getting our tastes educated to a certain flavor.—ED.]

RUDOLF HORA, *Deutsche Imker*, 347, is enthusiastic over a half-cold-and-half-warm arrangement. He says the cold arrangement in use in this country (frames running at right angles to the entrance) makes the bees move to the back part to get away from the cold; while the warm arrangement, largely used in Europe, makes the bees cluster toward the entrance to get the air. He com-

promises by making the entrance at one corner, which favors clustering in the center of the brood-chamber. Not hard to do if there is any thing in it. [The arrangement illustrated above is very pretty in theory; but

Rudolf Hora is clearly wrong in his statement when he says that when the frames are at right angles to the entrance the bees will be found clustered in the back of the hive rather than in front. The rule is, in this locality at least, that they will be situated in front directly over the entrance, with occasional exceptions. We have talked with prominent bee-keepers who say they have observed the same thing. If we were to call for a show of hands on this point we would venture to state that 99 per cent—yes, we may say all who have observed the matter at all—will say the bees will be clustered in front. If this be true, then Rudolf Hora's catcornered entrance has nothing in it.—Ed.]

THE scheme of wrapping up sections of honey in transparent paper is going to prove to be a success. If you did not read the article on page 1500, Dec. 1st, you had better do it now.

So far as we can ascertain, the winter thus far has been comparatively mild in most localities. This will augur well for outdoor-wintered bees, and at the same time give the young clovers a chance to grow.

EVERY bee-keeper should read the editorial in this department on the subject of allowing glucose to be called corn syrup. It is very important that every one of our subscribers write at once to Secretary Wilson and to Dr. Harvey W. Wiley, of the Bureau of Chemistry, Washington, D. C.

POSTMASTER-GENERAL MEYER recommends the issue of postal notes to the present session of Congress. A small fee will be charged, and the denominations will be as convenient as possible; namely, 10, 20, 25, 30, 40, 50, 60, 70, 80, 90 cts., \$1.00 and up to \$2.50. Notes payable to the bearer will be issued from 1 to 9 cts., and no fee will be charged. The postoffice comes into closer relationship with the people than any other bureau of the government, and these suggested improvements will make it more so.

LOMPOC, CAL., recently shipped 20 carloads of mustard seed to points in the East. The cars were not small-sized either, for each one held 500 sacks of 80 lbs. each. The trainload represented a value of \$35,000; and in honor of the event it was decorated with flags and bunting. Lompoc Valley is said

to produce about 60,000 sacks a year of both the red and yellow varieties. There are some bee-keepers in that valley who ought to be able to tell us something about the value and production of mustard honey.

W. K. M.

#### PURE-FOOD LAW IN CALIFORNIA.

THE pure-food law of California went into effect January 1. The enforcement of the law has been entrusted to the State Board of Health, with its headquarters and laboratory at the State University, Berkeley. The work is in charge of Professor M. E. Jaffa, a well-known pure-food expert. Under the law the sheriff of each county is the authorized agent of the board for the collection of samples. On complaint the sheriff will collect samples and forward them for examination. Heretofore it has been possible to "doctor" California honey intended for consumption in that State; but the new State and national law will prevent this entirely in the future.

#### SUBSCRIPTIONS ROLLING IN FOR GLEANINGS FOR 1908.

WE are gratified to know that, even during these panicky times, and after two very poor seasons, new subscriptions and renewals, with cash, are rolling in at a pretty good rate. Apparently our efforts to furnish a first-class bee-journal, making an aggregate for the year of 1600 pages for \$1.00, are being appreciated. GLEANINGS for 1908 will be better than ever. It is going in for a campaign for higher prices on honey, and to fight unfair competition from so-called corn syrups.

#### MAKING LABELS STICK TO TIN.

AT the Harrisburg convention, during the question-box discussion Mr. N. E. France said there would be no trouble about making labels stick to tin providing the oil on the surface of the tin is washed off with soda or vinegar; then when dry apply the paste and the label.

Some one else, we can not remember who, said there was something in making the flour paste. Mix the flour and water *cold*, and then cook to a paste. Don't mix the flour with warm or hot water, or the labels won't stick, it was said. This seems worth trying.

#### THE CRISIS IN THE GLUCOSE BUSINESS: "CORN SYRUP" VERSUS "GLUCOSE"; DO IT NOW.

ON page 1557 of our Christmas number we requested our subscribers to register a protest against allowing glucose to be called "corn syrup" in trade advertising, as demanded by the glucose interests. It appears that Dr. Harvey W. Wiley, Chief Chemist of the Department of Agriculture, and Dr. Dunlap and Solicitor McCabe, of the Pure-food Board, have already ruled against the glucose crowd, declaring that it is not permissible to use the term "corn syrup" to cover up and conceal something that won't sell un-

der its old and real name. Aye, there is where the shoe pinches. They wish to get a ruling in favor of "corn syrup" because, apparently, that would carry the impression that corn syrup is a new high-class food product made from the juices of the corn-stalk after the manner that sorghum syrup is made.

Glucose has earned for itself an unsavory reputation; it has a metallic, disagreeable taste—an article that will not sell if the public knows what it is getting. Apparently the glucose people understand this only too well, and, of course, looking to their own interests they do not propose to allow the decision of the pure-food commission to stand; therefore they have appealed to President Roosevelt and to Secretary Wilson, of the Department of Agriculture, asking for a stay of proceedings, during which they can present various arguments to the public and cause it to believe that corn syrup is the real name for a product made by treating *any kind of starch\** with sulphuric or hydrochloric acid.

Dr. Wiley and his associates have stood for pure food, and have all along been strenuous in insisting that all food stuffs be so labeled as to convey no deception. The general public does not know that corn syrup, so called, is glucose; and to allow this change of name would be the grossest kind of deception—a thing that would be entirely out of harmony with the provisions of the national pure-food law under which Dr. Wiley and his associates are working.

The glucose interests are alarmed, and they have good reason to be; for neither President Roosevelt nor Secretary Wilson has intimated that either one of them proposes to reverse the decision of their subordinates. They have simply signified their willingness to hear argument pro and con; and therefore it means that, unless bee-keepers and all producers of honest pure cane syrups and sugars register a mighty protest, *at once*, against making any change, there is danger that the decision of the pure-food commissioners may be reversed.

We are sure that the President, *provided* the full facts are put before him, will rule in the interests of the people and not in favor of private corporations and small retailers whose opinions would be biased by the profits arising from the sale of so-called corn syrups.

We urge every bee-keeper, as soon as he reads this, to write immediately a concise letter to Dr. Harvey W. Wiley, of the Department of Agriculture, Washington; D. C., commending the course he and his associates have taken in ruling against the use of the words "corn syrup" for a product known as glucose. A short but expressive letter should be addressed to Secretary Wilson, Secretary of Agriculture, and to President Roosevelt, Washington, D. C. requesting both to sustain the action of the Pure-food Board in placing a ban on corn syrup.

\* Glucose can be made of *potato* starch, as it is in Germany. Corn is not, therefore, an essential source of glucose, and it should not be called corn syrup.

We have nothing to fear from glucose when it is called by *its right name*. Since the new pure-food law has been in effect it can no more masquerade under the name of "honey," "maple molasses," or New Orleans molasses, etc., but it must be sold for *what it is*. It looks very much as if the glucose interests, seeing that glucose will not sell under its regular name, must disguise and cover it up by calling it by some new name under the pretense that glucose is the product of corn. While that may be true in one sense (as it may also be of whisky), yet to call glucose "corn syrup" is to place legitimate syrups and honeys in unfair competition with glucose embellished with a real nice name.

We hope our readers will not lose a moment of time, but sit right down as soon as they read this, and *do it now*.

#### THE HARRISBURG NATIONAL CONVENTION: THE SECOND DAY'S SESSION; THE GROWTH OF THE NATIONAL BEE-KEEPERS' ASSOCIATION.

GENERAL MANAGER FRANCE, after the appointment of some committees, presented his general report. In making a comparative statement of the growth of the membership during the last two or three years he said:

In 1906 we had 410 members who paid one dollar each. In 1907 we had 416 members who paid one dollar each. In 1908 there were 825 in co-operation with our Association who paid fifty cents each; whereas in 1907 there were 1008 who came in at that rate. The additions for 1906 alone were \$821; and up to the time I left home were \$974 for 1907. Of those, New York State has contributed by single membership 56 at one dollar each; and one county association consolidated, coming in, gave us 21, giving us \$10.50.

He then referred to the statistical crop reports which he had been gathering and sending to members. But this year he had sent out no such statement because he could count on his fingers all who had a crop.

He referred to the fact that the good offices of the National Bee-keepers' Association had been used to further the interests of the national pure-food bill, which has since been enacted into law. He believed this to be one of the grandest things the government has ever done for bee-keepers.

He had something to say about a special honey-label for members of the Association, which he was furnishing; and then he referred to the fact that some member would order only fifty labels notwithstanding it would cost just as much to print fifty as five hundred. He did not see how any one could object to the outlay of a dollar for that number. He thought, therefore, if any one used labels at all he could afford a dollar for 500 special Association labels.

After some discussion we listened to an exceptionally interesting paper by the government representative in charge of apiculture, Dr. E. F. Phillips, on

#### THE CARE OF EXTRACTED HONEY.

It will be remembered that some three or four years ago General Manager France collected a large number of samples of honey

from all portions of the United States, and exhibited the same at the National convention that was held during the St. Louis exposition. These were subsequently turned over to Dr. Phillips, who in turn gave them to the Bureau of Chemistry for analysis. These analyses, Dr. Phillips thought, constituted one of the most complete series that were ever made of American honey. Several things came up during this analytical work which needed some explanation, and he therefore prepared a paper on the care and production of extracted honey with a view of bringing these points out.

He first drew attention to the fact that nectar contains a large percentage of water, which, during the process of ripening, will be reduced down from 20 to 25 per cent in normal honey. Some very ripe samples would have as little as 12 per cent.

The ripening of honey consists not only in the evaporation of a surplus of water, but of the transformation of the sugars of the nectar into the levulose and dextrose of honey in about equal proportions. Unripe honey contains a large proportion of cane sugar; and the longer the honey remains in the hive, the less sucrose (cane sugar) will be found.

While pure honey will contain all the way from zero to 8 to 10 per cent of sucrose, the purest are those that contain the least. The United States standard of pure honey allows no more than 8 per cent. The thorough ripening of honey can not be too strongly recommended, and he favored bee-ripened honey rather than that ripened in tanks.

#### THE CANDYING OF HONEY.

He spoke of the peculiar characteristics of different kinds of honey in reference to the matter of candying, and told of the methods of correcting this by bringing the honey up to a temperature of 160 degrees; but he cautioned not to heat to a higher point. A greater degree of heat, and especially as high as the boiling-point, will change the character of the honey, spoiling its flavor, and from a chemical point of view it could not be considered as true honey. He advised against drawing off the liquid portions of honey from that which has been candied, because what is left will not be honey.

Honey is made up of dextrose and levulose in about equal proportions. The candied or solid portions are largely dextrose, for the levulose probably does not granulate at all. If, then, the liquid portion, consisting largely of levulose, sucrose, and water, be drawn off, then what is left will not be honey. He also emphasizes the necessity of stirring up honey when drawing it off for bottling purposes; for it would be unfortunate to have a bottled honey that does not analyze according to the prescribed standard set by the Bureau of Chemistry. Such honey will have to be classed as adulterated or not honey.

The speaker drew attention to the fact that, in the popular mind, granulation is an indication of adulteration with sugar. This is, of course, untrue. Many bee-keepers, on the other hand, go to the other extreme by

saying that granulation is an absolute test of purity. This statement is also untrue, since invert sugar, one of the adulterants sometimes used, will also crystallize.

He explained how age affects honey greatly. Repeated granulation and liquefaction year after year in some way affect the chemical composition of honey. Some one submitted to the Bureau of Chemistry some honey which was known to be absolutely pure, but which was 35 years old. It had too large a percentage of sucrose or cane sugar.

There is only one condition, Dr. Phillips explained, where it is desirable to heat honey hotter than 160 degrees, and that is to kill the germs of disease. He advised diluting infected honey by using an equal amount of water, and then boiling it thoroughly for at least 30 minutes, or, better, an hour.

#### VARIATIONS IN HONEY.

The speaker called attention to the fact that well-known honeys from different plants vary considerably in taste, color, granulation, etc. While granulation may be considered a property of all honey, yet the fact that some granulate more than others is due to a larger or a lower ratio between dextrose and levulose. The following table will make this clear:

##### NORMAL HONEY (FROM NECTARIES OF FLOWERS).

1. High purity (high in sugars, relatively low in dextrose, gums, and other non-sugars).

*a* Levulose type; *e. g.*, mangrove, tupelo, sage.

*b* Average type.

*a* High in sucrose; *e. g.*, alfalfa.

*b* Low in sucrose; *e. g.*, buckwheat.

2. Low purity (relatively high in dextrose, gums, and other non-sugars; *e. g.*, basswood, sumac, poplar, oak, hickory, apple (most tree honey)).

##### ABNORMAL HONEY (NOT FROM NECTARIES OF FLOWERS).

(Generally high in dextrose, gums, and other non-sugars.)

1. Honey-dew honey (from aphides and other insects).

Coniferous honey (plant exudations not from nectaries).

Honeys containing approximately the same amount of levulose and dextrose, and which are high in sugars (average type), granulate readily. Very few honeys have more dextrose than levulose. If, however, the levulose is considerably greater than the dextrose (levulose type), or if the non-sugars are relatively high (low purity and abnormal honeys), granulation is retarded. Some honey-dew granulates rapidly; but no abnormal honeys of that type were included in the samples examined, and consequently they are not included in the table.

This paper called forth a great deal of interesting discussion, winding up with a vote of thanks to the Bureau of Entomology, and to Dr. Phillips in particular, for his interesting and valuable paper. Indeed, some experts were present, including Mr. France and Mr. W. A. Selser, who pronounced it the best contribution on the subject that had ever been given before the National convention.

We have attempted to give only the main points of the paper; but those who desire to see the full text are referred to the verbatim report which General Manager France will soon send to the members of the National, if he has not already done so.

It should be observed that this report is well worth the dollar paid for membership,

to say nothing of all the other benefits which one secures.

SPLIT SECTIONS A LA HAND, VERSUS THE  
REGULAR STYLE OF SECTION WITH A  
FULL SHEET OF FOUNDATION  
CUT TO FIT.

DR. C. C. MILLER has commented quite at length on the subject of split sections as discussed by J. E. Hand and H. H. R. on page 18. As there is hardly space to admit the whole discussion in his regular department of Stray Straws we are placing it here at this time in order that the reader may get the benefit of further discussion before the question is forgotten. Dr. Miller writes:

Split sections, as compared with putting in foundation with hot wax, are well discussed by H. H. R., p. 18. Pardon the egotism if I suggest something better than either—bottom starters.

First, let me say that the objection to the appearance of split sections, if I am rightly informed, is a very serious one in England, where they are more used. I feel sure that, if my sections had a split with the wax showing through on top and sides, it would reduce the price very much more than 50 cts. a thousand. That one objection gives the preference to the hot-wax plan.

But compare either plan with bottom starters. If a section is fastened securely at top and bottom it must ship safely, even if it does not touch either side. The bottom starter as well as the top starter is fastened just as securely as by the hot-wax plan, for it is the hot-wax plan. How about the sides? Well, I do not think you could tell by the looks of my sections whether the sides had been hot-waxed or not; so, as far as safety in shipment and looks are concerned, I believe hot-waxing a full sheet has no advantage over the bottom starters. The only question, then, is as to comparative cost of labor in putting in. You estimate the time for hot-waxing at about 200 an hour. Possibly an expert might do better than that. But an expert will put top and bottom starters in 480 sections in an hour. A single piece to fill the whole section must be cut with great exactness.

A one-piece section is not always exactly square until forced square in the super. If foundation is hot-waxed in a section that is a little out of true, and it is then crowded square in the super, there will be trouble. A variation of  $\frac{1}{8}$  inch or more in cutting top and bottom starters will make no trouble, and there will be no trouble with a section somewhat out of true.

When the section comes into the consumer's hands, if there is any preference it will be in favor of the bottom starters, for the hot wax poured all around ought to make it just a little harder to cut the section clean from the wood.

Against bottom starters it must be said that more skill is needed in using the hot plate, or an occasional top starter may drop before the bees can fasten it, while any slouch can make it secure by daubing on enough wax with the other plan. Your honor, we here rest the case.

The objection raised by Dr. Miller as to the unpopularity of these sections in England is a very serious one. We raised this point with Mr. Hand in private correspondence some months ago, stating that, in our opinion, such sections, if sold largely in this country, would give rise to the old comb-honey canard, because the consumer, not understanding the nature of foundation and its uses, would be likely to jump to the conclusion that the contents of the section were "manufactured," because he could see undeniably the handiwork of man. The foundation projecting through the wood on three sides would be almost sure to arouse his suspicions.

In relation to this point Mr. Hand wrote that he had found no trouble whatever; but we feel firmly convinced that, if such sec-

tions ever become popular with bee-keepers, we shall have to be constantly "explaining" and always on the defensive.

But this is not the only point. Such a section, with foundation projecting through the top and sides, is unsightly compared with the neat clean face of the regular section. That fact will hardly admit of argument.

In this connection a valuable article on the subject has just come from E. F. Atwater, Meridian, Idaho; and while we have not the space to give the whole of it in this issue we wish to present herewith the part having an especial bearing on this question. We expect to publish in our next issue some engravings made from photographs which he sent. On the subject of starters, he says:

As I was the first in this part of the West to use sections containing a full sheet of foundation fastened on all four sides, and as that experience has covered several years, extending in part to the present, I feel qualified to say something about the results. In many cases the results are all that could be desired—beautiful slabs of honey without hole or blemish to mar their beauty. But here the (as yet) inevitable sagging propensities of all surplus foundation on the market, in hot weather, is a factor with which we must reckon. A full sheet of foundation as usually used, attached at top only, with  $\frac{1}{8}$  to  $\frac{1}{4}$  inch space below it, will usually sag evenly, resulting in a comb even and smooth of surface. But if the foundation completely fills the section, being attached at all four sides, then when the sheet does sag, a bulge usually occurs somewhere near the bottom; and the bees, when the comb needs capping, are often unable to puzzle out a satisfactory solution of the problem; a depression or small uncapped area results, besides a tendency toward comb attachments to the separator.

But the downward sagging does not constitute the only difficulty. Under the manipulation (or "mandibleation") of the wax-workers, the sheet of foundation enlarges transversely, resulting all too often in another bulge in the foundation, and giving rise to another problem which is too difficult of solution for the untaught instinct of the bees, and this results in another blemish on the face of the finished comb.

In some localities the sagging of the foundation is undoubtedly more of a problem than in others. Wherever full sheets of foundation fastened on all four sides with hot wax are found to sag and buckle, we should expect that the same trouble would be found with foundation secured on the split-section plan. At any rate, it is quite important in these days that we make as few changes as possible in our bee-hive appliances. Where regular goods and regular outfits already in use can be made to do the work it would be folly to go to the expense of a change. In the case of the problem under consideration, we would say by all means stick to the regular section that one is using. We will shortly illustrate how any one, with home-made appliances costing only a few cents, can fasten full sheets, cut to a fit, into the section, and do a neat and perfect job.

BE sure to read about what the glucose interests are trying to do in pulling the wool over the eyes of President Roosevelt and Secretary Wilson on the subject of calling glucose "corn syrup." It is to your interest to write at once to Secretary Wilson and to Dr. Wiley. Do it now. There is not a minute to lose.

STIMULATING IN THE SPRING WITH SHALLOW EXTRACTING-COMBS OF HONEY.

"I use the Danzenbaker hives, and winter the bees on their summer stands. In buckwheat bloom I expect to get a lot of shallow extracting-frames in Danzenbaker supers filled with buckwheat honey. Then I will store them away until the first warm day next February or March, when I can give each hive a super of these filled shallow frames. When any of the colonies are ready to store surplus honey I will raise this super put a super of sections filled with full sheets of foundation on the hive, then put on a bee-escape board and get the bees out of the shallow frames, which can then be stored until the following spring. Do you think I would be paid for the extra honey and work? Or would it be better for me to put the shallow frames of honey on the hives in the fall before I pack them for winter, instead of waiting until spring? Would the extra space to keep warm be a detriment?"

"Would it be just as well, instead of giving a full super, to put four or five of the shallow frames of honey in the center of the super and leave the rest of the super empty? It seems as if even four or five frames would be more than any colony would ever use, and still it would stimulate them to brood-rearing in the spring."

"Girard, Pa. NORTON C. MILLER."

Regarding the first proposition and question I would say there would be advantages and disadvantages in carrying out that program; and in my judgment the disadvantages would more than overcome the advantages. For this reason I should say that it would not pay to work so—no, not even in a larger yield of honey, to say nothing of the time spent in the different manipulations.

The advantages would be two in number as I see it. The first would be the securing for the bees an abundance of stores, so that there would be no danger of the colonies ever becoming short to an extent bordering on starvation, or to their retrenching in brood-rearing; but this matter should be looked after in the fall by way of *knowing* that each colony has sufficient stores in the brood-chamber to supply all wants till the flowers give them an abundance the coming spring. This is an easy matter if all colonies are carefully looked after in September, just as soon as the surplus of the season is over. Those not having 25 to 30 pounds of stores should be given full-sized Danzenbaker frames of honey to take the place of the light frames in the hive, or the colony should be fed the proper amount where such frames of honey are not on hand. In this locality it is of rare

occurrence for any colony which is worked for comb honey to be short of stores for wintering and springing. Even during the unprecedented spring of 1907, not one out of twenty of my colonies ran short of stores.

The second advantage would be that of the bees acquiring the habit of entering the super freely while the super of extracting-frames was on the hive. Having been "frequenters" of this super they would more readily enter the super of sections when it was put on to take the place of the extracting-super, and in this respect quite a little would be gained, but nothing like enough to overcome the disadvantages, next spoken of.

Of all the time in the year when the brood-nest should be kept as warm as possible, early spring is that time; and the proposed plan of working not only breaks open a joint between the cover and top of the super, but one between the super and the top of the brood-chamber, at which joints the warmed air from the cluster can not only go out into the open air, but it will be fanned out by every passing breeze or high wind that blows. And not only this, but the ascending heat from the colony below will be up in this super at just the time when every particle should be economized for brood-rearing, so that the colony, instead of becoming strong in time to take advantage of the first opening flowers, would remain weak on account of the cracks all about the top part of the hive and the *much* too large brood-chamber which they would have through the added super. While I claim that the bees are enabled to confine the heat very largely inside the cluster, so that brood-rearing will go on quite extensively within the cluster, no matter what the conditions just outside said cluster are, yet the warmer the air outside of this cluster, the more the cluster will expand, or the less number of bees it will take to make the "walls" to the cluster or brood-nest proper, and so an advance is made by confining all the heat possible as nearly within the limits of the cluster as may be. And the adding of an extra super above the cluster in the spring is in direct opposition to nature's requirements, which, of course, is opposed to a paying crop of honey, or any pay for the labor performed in thus working.

Then, if Mr. Miller's bees are like mine, unless he puts a queen-excluder between this added super and the brood-chamber to the hive, he will have more or less brood in the extracting-frames at the time he wishes to raise them up for the section-super, which brood is just where he does not wish it, and will cost him the honey necessary for its rearing (besides injuring his extracting-combs), and the extra work it will make for him to get rid of this undesirable brood.

Again, this proposed plan militates little if any against swarming, which will be quite likely to occur soon after the bees have been run down out of the extracting-super into the sections. Such a plan could not be depended upon in the least when working an out-apiary unless it resulted in too weak colonies to swarm, or do little else to advantage.

Lastly, with the running of the bees out from these supers, and the storing of them away for the next spring's using, comes an invitation to a sumptuous feast for the wax-moths and larvæ, or else a continual fight to save these combs from being destroyed by the ravages of these pests. Of course they can be fumigated at the proper time, and then put in a moth-proof room; but all of this is extra work at a time when minutes and hours are of great value, and the results obtained would in no way compensate for this or any other of the disadvantages.

The answer to the second question about putting this extracting super of filled combs on in the fall would be the same as that given above, with the additional thought which Mr. Miller suggests with his question of "Would the extra space to keep warm be a detriment?" All unnecessary room during winter and early spring is *always* a detriment, and against the best interests of the bees and their keeper.

His third question and proposition only add to the disadvantages through its giving additional empty space, either in taking the heat from the cluster of bees, or in the time and material for packing the space not occupied with combs, or in the building of drone comb in this space should a little honey come in from fruit-bloom before it was time to put on the supers of sections, and in running the bees out from these supers of extracting-combs. As I said at the start, the disadvantages of these proposed plans much more than offset any advantage which may be gained, and I am sure if Mr. Miller tries these things he will find the results as outlined above.

But, friend Miller, if you will make a change in your plan according to the following suggestions you will see all swarming stopped, and the bees will go to work in the sections as you never saw them before. Instead of the extracting-super, provide a Danzenbaker hive-body containing worker combs that are from one-fourth to two-thirds full of honey. When your colony becomes strong enough to need more room in March or April (possibly May, in your locality) put a queen-excluder on the hive, and place this filled hive-body on top leaving it there till it is time to put on the sections, and then put this upper story down on the bottom-board where the brood-chamber has been up to this time, putting your super of sections on top. Shake and brush all of the bees from the combs of brood and out of the brood-chamber, allowing them to enter what has previously been the upper story, now on the bottom-board.

If you tier this hive of beeless frames of brood over a weak colony, using a queen-excluder between, you will not only overcome the wax-moth nuisance but have your hive and combs filled with honey in the right shape for using again the next spring, and so on year after year. In fact, you will have just what you are looking for in your proposed plans, with all of their advantages, and *much more* added, and that with none of their disadvantages.

After having been buried up for a whole year, like a mouse under a haystack, here we are again. Such a flood of material for the use of the editor has come to his sanctum that Pickings has stood aloof simply from motives of modesty. In the stack alluded to there have been Stray Straws, Notes from the Southwest, Mr. Crane's department, that of J. A. Green (a rare visitor, however), that of R. F. Holtermann, the crispy articles from J. E. Hand, E. W. Alexander, E. D. Townsend, Prof. Cook, Doolittle—more than I can name. These men, in the short space of a year, have completely transformed the old plan of getting out GLEANINGS, and, as a matter of course, the hand-car has been removed from the track to make way for the Cannonball express. Besides, Mr. Morrison has devoted all his time to an examination of exchanges during the past year, and he has squeezed the lemon perfectly dry. But for all that, the manager of this department has been busy on every page and line of GLEANINGS during the absence of Pickings, in the endeavor to have this journal maintain as high a degree of typographical accuracy as possible under the circumstances. With the help of a friend I have prepared the following, which may be of interest to some:

#### SUBTLE DIFFERENCES IN COLONIES.

To help explain why some colonies do so much better work than others, even though the conditions of all seem to be equal, the editor of the *Bee-keeper's Review*, in the December issue, republishes a translation of an article by C. J. H. Gravenhorst, who worked out the problem to his own satisfaction about twenty years ago. Briefly, the reasons given by the celebrated German authority are as follows:

1. The ideal colony must have a faultless queen; hardy, sound of body, and, above all things, fertile, and her progeny distinguished by diligence.
2. Nevertheless, such a queen alone does not make an ideal colony. At the right time, that is, when honey is coming in freely, there must be plenty of empty comb that no time nor honey be lost in building comb.
3. Our ideal colony must swarm at the right time or not at all. It swarms at the right time when it swarms so early that the queens of the after-swarm, if such are allowed, become fertile, and the first or prime swarm has its combs completed before the opening of the main harvest.
4. The ideal colony must not be over-populous. A hive is over-populous when its working force is too great in comparison to the dimension of the hive and to the number of wax-building bees.

Such a condition is intolerable to the bees and they try to help themselves by loafing. Their instinct teaches them to begin this loafing even before the hive is over-populous. The bees seem to see the combs are filled and capped, that bees are daily hatching, and that they will soon be crowded. A colony in such a condition will never perform the wonders in gather-

ing honey that we may expect from one less populous. Such a colony feels instinctively that its abode will soon be too small, and the swarming fever sets in, and we know that when that is awakened the bees will continue to loaf. At the most, only as much honey will be gathered as is needed for making the swarming preparations. A colony with the swarming fever is of little value as a honey-gatherer.

5. The best honey-gathering colonies are not kept at home during the best honey-flow by the nursing of too much brood. If there is too much brood in proportion to the working force, most of the honey gathered will be consumed by the brood. The bee-keeper whose bees rear a large amount of brood during the main honey harvest, or near its close, will find, as he stands before his colonies at the close of the harvest, that, although they are strong in bees and the combs faultless, the latter will be empty and will stay so.

#### SMALL NUCLEUS HIVES FOR QUEEN-REARING.

The queen-breeders over the country have adopted various means for providing nuclei, or small colonies, in which young queens may be temporarily placed until after they have been fertilized. Many have made use of two or three frame nuclei in standard-size hives; but a few years ago "baby nuclei" were advocated on account of the small number of bees needed to fill them and the general inexpensive equipment required. But because of the care necessary to maintain such abnormally small clusters of bees the larger twin-mating boxes were developed for the purpose of providing a small hive large enough to hold two clusters of bees that would, in a measure, take care of themselves. These have proven very satisfactory, although some of the experts are beginning to feel that it may be perhaps cheaper, after all, to use nuclei on full-size combs and frames, thus saving the expense of odd-size hives and fixtures.

In this connection it is interesting to note the report of W. H. Laws, a veteran queen-breeder, as given in the November issue of the *Bee-keepers' Review*.

Small nuclei for queen-rearing are still a success with W. H. Laws, but he now reports that, taking the whole season through, there is really less labor by employing three-frame nuclei of the regular size. Such nuclei take care of themselves right along, month after month.

#### WAX-PRESSES.

The readers of this journal will remember, doubtless, that we have advised against the use of hot-water wax-presses except in the case of very large producers—those whose output is 300 lbs. or more of wax per year. One of the reasons for our opinion was the discoloration of the wax due to the long-continued heat to which it is almost of necessity subjected. Of course, if the wax is not allowed to remain for any length of time on the surface of the boiling water it will not be discolored to a great degree; but it is not an easy matter to keep the wax running off as fast as it rises to the top.

At the convention of the Ontario Bee-keepers' Association, which was held in Toronto, Nov. 13, 14, and 15, the Hershiser hot-water press was compared to the Hatch press. Mr. J. L. Byer, in the *American Bee Journal* for December, gives the following report of this discussion:

Relative to a question on wax-presses, those who

had tried the Hershiser admitted that, while more wax could be obtained, yet the quality was not so good as that taken with the Hatch-Gemmill press. Later on during the convention, Mr. Sibbald, by means of a model, explained the workings of a press (one member called it a cross between the Gemmill and Hershiser presses) which he thought superior to either the Hatch-Gemmill or Hershiser. (Cuts of this press with Mr. Sibbald's explanations will appear in the printed annual report of the convention.)

#### SOME VITAL POINTS IN BUILDING UP A HONEY MARKET.

It may be that salesmen are born and not made; but we are inclined to doubt it. At any rate, any salesman may improve. Mr. M. V. Facey has an excellent article in the *Bee-keepers' Review* for November in which many sound doctrines are preached. We should like to give his thought in full, but we have room for only a part of the article. He mentions the fact that he now has about 1000 customers; and under the heading of "Don't Argue, but Give the People what they Want," he says:

In building up this trade I have at all times placed myself in the place of both buyer and seller. You have, first of all, to learn the tastes of your customers. If you are building up a home trade, you will, as you start out, find that one person likes basswood honey, another clover, another an amber, and a fourth buckwheat. A great many salesmen will try to persuade certain ones that their taste is a mistaken one; that such and such honey is better than the one their taste calls for. This is a great mistake. No man wants the salesman to dictate to his tastes, as he knows perfectly well that the honey he likes the best is *the best for him*; and this is what the wise salesman should offer him. And right here I would say that the idea of cultivating the public taste for this or that kind of honey is largely a mistake. People have their tastes; they are largely fond of honey; and, instead of cultivating a taste, we have only to cater to it. I find this is an art that bee-keepers learn very slowly. We are too apt to set up our own standard, and expect everybody else to adopt it because it is *ours*; and thus, in the supposed perfection of our own knowledge, we are unable to detect our own defects. We should rather, while we have an eye turned upon the public, studying its demands, have the other eye turned back upon ourselves, studying *our own defects* of both trade and production.

Therefore, instead of trying to build up a trade by belittling your rival, you should learn wherein his goods excel yours, and bring your goods up to or beyond his standard. See that your honey is the best ripened, the best graded, and the best put up, and then, as you go out and sell this honey, people will appreciate it; and when you have a man's honey trade, and furnish him with such goods, he will stick by you and even give you a cent or two a pound more than he will give your neighbor.

Every sale should be made as though your *whole trade* depended upon that one transaction. I once bought honey of a man who kept out his inferior goods for his home trade, with the remark that it was "good enough for them." That was the opposite of what I am trying to impress upon my readers. If that man had valued his home trade, and if he cared in the least to build it up, he should have kept his very choicest honey for it, and, instead of a small trade at a low price, he might have had a good trade at a good price that would easily have taken all his honey.

I said it was necessary to furnish each buyer with the kind of honey his taste preferred. To do this we must learn to grade honey. This is a weak point with many bee-keepers and with some dealers. I have been offered "clover honey," by large and experienced bee-keepers, that seemed to have hardly a trace of clover in it; besides, it was dark in color and strong in flavor at that. I have bought a lot of white honey and of dark honey of a dealer, wherein much of the dark honey was *whiter* than the *white*.

To hold a person's trade, we must furnish him *what he wants*. If a man is dainty in his tastes, and wants clover honey, and we furnish him honey-dew a time or two, we will find he will very promptly avoid our honey quite as persistently as our satisfied customers

stick by us; and, as one pleased customer will often bring half a dozen more buyers, so one unsatisfied customer will often deter half a dozen from buying.

Mr. Facey's second point is: "Sales largely depend upon pushing the goods." Concerning this, he says:

We must keep our goods before our customers. A family promptly supplied will use several times as much as one that has to hunt for the goods. I know families which, when promptly supplied, will use from twenty to thirty gallons of honey per year, who otherwise do not use more than four or five gallons. Honey is an article which is used by many people, or, perhaps, by most people, largely in proportion as it is drawn to their attention, and made easy to obtain. Its sale must be *pushed*; hence store-keepers often so signally fail in building up a trade. It is a luxury, but where constantly supplied it is then a necessity.

I have not found the fear of adulteration much of an obstacle in my trade. I am very particular as to the purity of my honey, and I absolutely guarantee all I sell. If any thing puzzles my customers I regard it as a favor to be permitted to clear up the matter. We often sell our honey to people who know nothing about bees, and, therefore, when so many bee-keepers know so little about honey, we can not expect them to know much, except that it is pleasant to the taste and a desirable article of food. I acquaint them with the workings of the pure-food commission, and am always pleased to have any test made. Our very willingness to submit our goods to the test greatly increases confidence in their quality and purity. We should avoid trying to tear down another's reputation in order to build up our own; and when I see this done my suspicions of the critic are always aroused, and I make purchases of such people with extreme care. It certainly is no recommendation of our honey to say that our neighbor's is *poor*. If it is poor, the people will soon find it out without our officious declaration, and the suspicion we attempt to place upon him will almost invariably react upon ourselves.

Previous favorable acquaintance with the people along a given route goes far toward making the machinery run easy in the sale of honey.

A prosperous 1908!

Save the pieces. It means much in the course of time.

All successful men have well-laid plans. Have you?

That Marbach queen-excluder seems to be quite an improvement. I saw samples of it.

Resolutions of the right kind are good if carried out; so let us resolve to make our industry better than ever. Keep better bees, and keep bees better.

A mild winter and lots of rain here in the South has given a new impetus to bee-keeping. The bees are in fair condition; and most of the main honey-yielding plants are already well grown and bee-keepers are hopeful.

Plurality of queens has not appealed to me. It may pan out something good later, but at present it seems better to keep *one good queen* in each separate colony.

The divisible brood-chamber, after a ten-years' trial and comparison with others, has given excellent results. With me they are time-savers, and afford me both pleasure and profit. I can produce more honey with them with less labor and expense. This kind of hive is not a "new-fangled" thing with me.

"Sour clover" (*Melilotus Indica*), mentioned on page 1310, grows wild here, but is not considered valuable for bees, as its blooming period here is quite short, and bees are not always present. It is an annual here, naturalized along the southern borders of Texas. When I first saw it before blooming it was mistaken for white sweet clover. The fact that it grows so well indicates that the other species, more valuable to the bee-keepers, *M. alba* and *M. officinalis*, should thrive here also. I will try them.

Stachelhausen used divisible-brood-chamber hives extensively for years; and with these and shaking swarms he managed out-apiaries successfully. With these divisible hives, swarming can be successfully controlled when running outyards for either extracted or comb honey. For years his average per cent of swarming has been only 2. His son-in-law, Mr. Ed. Dietz, succeeds him in his business, and is as enthusiastic about such hives. When supplies are made at home such hives are cheaper, for they may be cut from narrow lumber.

Organizing the bee-keeping forces for better production, wiser distribution, profitable prices, and better care of the apiary, is work that should be given more attention. There is no better time to begin this than now. The time has come when organized efforts will bring better results. Education is necessary in all branches, and this should be eminent in association work. It is not how much honey is produced, but how much of it is better, and then sold in such a way that it will bring most profitable returns. By beginning with the better care of the apiary during 1908, and applying it to all the other branches as well, a step would be made in the right direction.

Around to all the apiaries should be made in early spring. The colonies should be examined for stores, queenlessness, and other conditions, and noted. This will save many colonies which often starve when the owner thinks they have sufficient stores or are all queenright and well. Take along an ax, a hoe, and a rake, and cut off those low limbs and trim up the trees where the veil caught last summer. Cut out the stumps and other rubbish; rake it off, and see the effect. It shows up nicely. "Little drops of water,

little grains of sand, make the mighty ocean and the wide, wide land." So in bee-keeping. Little wastes of honey, with water, make mighty barrels of vinegar, and little bits of wax, generally wasted, make great big cakes.

#### HONEY PRICES: TEXAS VS. THE NORTH.

It seems somewhat strange that complaints should arise against the honey-market quotations of the northern and eastern markets. That there was a wide difference in the quoted prices of honey in the different markets was noticed; but why this? Is not the local bee-keeper of the North, who is so far in advance of us Southerners, in position to straighten these matters out to one and the same level in all these markets adjacent to each other, allowing a slight difference for difference in freight, etc., at more distant points? Who makes the prices of honey, anyhow? and if the dealer fixes his quotations, what does he go by?

In this one thing I believe some of us here are ahead. It is becoming more and more customary for buyers and dealers here to write us for "prices on your honey." For

erased when necessary, and the surface used over again. As this side is protected against the wall of the hive it is not necessary to write so it can not be erased.

SCHOLL HIVE-NUMBER—DETAILS.

Notice that a bent crate-staple is used instead of a straight one or a nail. It is done for the reason that the latter would soon be driven into the wall of the hive-bodies when these are handled, and the "numbers" could not be hung on them. With the bent staple this is quite overcome, for it acts like a spring, and will not go deeper into the

wood. With this spring-like pressure the tin number-plate is held firmly after it has been hooked in place. Such a staple is put on each end of all hive-bodies so that, no matter which end is placed forward, there will be such a staple on which to hang the

THE "SCHOLL HIVE-NUMBER" IN USE.

years I have quoted *my own price*, and regular price lists are sent out. First, it is ascertained what the prospects are, and how large the crop will be. Then a price is set, and in this way a cent or more a pound above other prices has been obtained.

#### HIVE-NUMBERS.

It is well to have each hive with its number so a record can be kept of it. Many ways of applying such have been tried, but nothing has given me more satisfaction than the one pictured just above. They are made of heavy tin, painted on both sides. On the front is the number, while the back is used for keeping records of the colony with a leadpencil, so they can be easily

number. It is not necessary to unhook the tin for making records on the back. Just stoop down beside the hive; lift up the lower end of the tin on its staple hinge, and examine the notes or add more. These will be upside down after the tin is turned up, and are readily read from the top. Try some of these, and report. Perhaps they can be improved.

#### WHAT SHALL WE CALL THEM—

"section," "story," or "brood-chamber"? For want of a better term, one of the portions of a divisible-brood-chamber hive has been called a "section," and I have often used it without conflict here, because sections of the other kind are very little used

in the South, comb honey in sections being almost a thing of the past. Dr. Miller, page 1308, does not like the term, but wants it called "story." Editor Root objects to that as meaning a full-depth hive-body, and suggests "brood-chamber" as a better term. I object to all of these terms, especially the latter, for the brood-chamber proper may consist of several parts of the divisible-brood chamber hive, often three or more being used. Besides, the same parts are continually changed about, sometimes the lower, and then as the upper portion of the brood-chamber.

Better call them "cases." A divisible-brood-chamber hive consists of a series of shallow cases, two or more for the brood-chamber; the same kind of cases, and frames for extracted and bulk-comb honey supers, and such cases with sections, instead of frames, being used for producing section-box honey. They can be called supers when used above for honey, and are "brood-cases" when used for the brood-chamber—thus two or three cases or more for a brood-chamber. Then we can call them the lower case or upper case of the divisible brood-chamber, and know just what is meant. There should not be any confusion between cases of brood of such hives and shipping-cases of comb or extracted honey. On the hive the shallow cases are always called supers, so there's no confusion between these and shipping-cases of honey.

#### RAPID GRANULATION OF HONEY.

Never did I see honey granulate so quickly as this year. It caused considerable trouble in the markets at the beginning of the season. Honey extracted in April, May, and June would, in many instances, granulate in ten days after it was taken off the hives. As a good harvest was obtained in most of the main honey-producing sections of Southwest Texas it was sent to market in hundreds of carloads in a very short time. Most of this was bulk comb honey in cans, which made it worse, and hence it left a large stock of unsalable honey on the dealers' hands. This caused a slowing-up of sales, as many were afraid to buy more; but the demand stiffened again rapidly after the granulated honey was out of the way. This was not done without much trouble, however, as it necessitated melting up the granulated comb honey and separating the wax from it.

After this experience, the majority of bee-keepers heat all their extracted honey, before shipping it to market, to 150° F., which delays granulation for a considerable length of time. For bulk comb honey the liquid honey is heated to the above temperature, and then poured over the packed comb honey in the cans while still hot. The comb honey will not granulate as fast as the extracted would; and by heating the latter before putting in the cans with the comb, the whole mass is kept from granulating a long time. Of course, it will granulate at the approach of cold weather late in the season.

#### SCIENTIFIC AMATEURS.

##### The Modest Small Bee-keepers.

BY E. R. ROOT.

Among those who attended the Harrisburg National convention was Miss Susan E. Williams, of Moorestown, N. J., a suburb of Camden, opposite Philadelphia. It is true she took no prominent part at that meeting, yet it was easy to see that she was an enthusiast and a good listener. Such people always help a speaker by their presence.

MISS SUSAN E. WILLIAMS, AN ENTHUSIASTIC AMATEUR BEE-KEEPER.

While Miss Williams has kept bees for only a comparatively short time, she represents a type of "scientific amateurs," if I may use the phrase, who have done much to enrich our bee literature in all countries. It is these people who occasionally give to the bee-keeping world some practical suggestions as well as some scientific facts. Miss Williams, while she belongs to this class, is exceedingly modest in her attainments in bee-lore, especially for a beginner. Her neat little apiary in her back yard, where she has found

MISS WILLIAMS' APIARY, AT MOORESTOWN, NEW JERSEY.

so much pleasure and profit, is shown herewith.

It seems one of her friends asked her to give a series of talks on bees and other natural-history subjects. The result was, she took up the study of bee culture with all her heart and soul, and finally became the possessor of a modest little back-lot apiary, types of which one can see all over the United States. She started with two colonies in May, 1905, and in the spring of the following year she was the happy owner of six colonies, and at the present time she has something like 25. Her crop last year amounted to 1000 lbs., mostly extracted, and two colonies gave a return of over 100 lbs. each. For one only two years in the business this is not a bad showing. Had she not been familiar with bee-literature she could scarcely have accomplished this.

When I asked Miss Williams, toward the close of the convention, if I might have a picture of her and her bee-yard for publication in GLEANINGS she looked at me somewhat curiously as if inquiring why her personality would be of any value in a bee-journal. She was more curious still when I explained that she was a "type." "A 'type' of what?" she asked. "Of a class who are far more numerous than those who are engaged in bee-keeping solely for the 'almighty dollar.'"

There are thousands and thousands of "back lotters" among the professional people, and nature-lovers who do more to popularize honey among the masses than any

other class of bee-keepers, and it is to this class that we wish to pay our respects at this time, for they are performing an invaluable service.

Perhaps some of our lady bee-keepers will recognize Miss Williams as the one who contributed an interesting chapter in our booklet, "Bee-keeping for Women." On reading this, one can not help feeling impressed with her enthusiasm and love for this most fascinating of all nature-studies, bee culture.

I am glad to introduce Miss Williams as a modest representative of her class, because I think GLEANINGS has not made enough of those who are in the business, not for the dollars and cents, but for the mere love and pleasure they find in delving down into the hidden secrets of nature. We wish there were more like her, because the one who is looking only after the glittering dollars very often misses some of the most wonderful things this blessed old world has to offer.

### AN APIARY UNDER ROOF.

An Open Shed over the Hives for Protection.

BY WILLIAM F. OTT.

As the space for my apiary is limited I built the "shed" as seen in the picture, a two-story concern which keeps the north winds and storms from the hives. The colonies seem to get along very well in these quarters;

AN OPEN-SHED APIARY IN PENNSYLVANIA.

This affords partial shade in summer and protects the hives from the cold north winds in winter.

and the building being shaded in summer by overhanging fruit-trees makes a very pleasant home for them. My leisure hours are spent, in summer, about the "bee-stand" which I enjoy very much indeed. I have one colony of the golden-all-over bees. I bought a fertile queen and introduced her to half a gallon of "loafers" which I scraped from the hives early in the morning, according to a plan which I learned by reading, and kept them "queenless and broodless" for 24 hours. Then having the queen on hand I introduced her and was indeed happy to find her all right and laying eggs later. Finally my anxiety was relieved to see the little yellow fellows on the combs, easily detected from the ones on hand before. They are getting along very nicely.

Johnstown, Pa.

### BEE-KEEPING IN TURKEY.

Some of the Leading Honey-plants of that Country.

BY N. J. NICOLAIDIS.

I am a bee-keeper of Greek nationality—the first one, very probably, who has adopted movable-frame hives in this old country. From your excellent paper, to which I have been a subscriber these three years, I see that you are interested in bee-keeping all over the world.

My interest in bees and in movable-frame hives was aroused by a few hints in class by my professor in physics, and, as a result, I decided to find out if bee-keeping pays in this country on the shores of our beautiful

Bosphorus. I started with one colony, bought from a farmer in my neighborhood, which colony was comfortably lodged in a barrel such as are used in this country for transporting water. The swarm that this barrel hive gave me in the latter part of April, which is with us the swarming season, was a really monstrous swarm, and was successfully hived in a Dadant hive of my make.

At that time I was a subscriber to a Swiss bee-journal edited in French, which, however, being too local, did not satisfy me. It was not without pains and eager researches that I found out one of your advertisements, and as a result I sent in my subscription.

My little apiary consists now of eight Langstroth hives with Hoffman frames. The bees in them are all descendants of their barrel ancestors, and are working pretty well indeed, notwithstanding they had comparatively little care from me, as I am obliged to be away most of the time. Next year I expect better results, as I have decided to run half of them for section honey on the Doolittle plan, with increase, and the other half for extracted on the Alexander plan of increase.

The important nectar-yielding flora of this locality are the following: Fruit-trees, white acacia, horsechestnut, little basswood, peppermint, ivy, and heather, besides some other minor sources that give a continuous light honey-flow all through June and the early part of July. Our most important honey-flow is that from the acacia bloom, giving a honey of fine flavor and light color. One defect of this honey-flow, however, is that it can not be kept separate from horsechestnut, which yields at about the same time a honey

of pinkish color and rather unpleasant taste. The honey obtained from heather is of dark color, and rather strongly flavored, granulating as soon as cold weather sets in; yet the sections made during this honey-flow are of the finest appearance with regard to wax and cappings. The ivy blooms at about the same time, and yields a honey of fine body and rather pleasant taste.

Some time ago I ordered an Italian queen, and I hope to have her by the end of this month, when, if not too late, I shall try to requeen some of my colonies for the purpose of comparing the work of these Italian-bred colonies with the native species. The bees of this country are industrious, and winter well outdoors. Their defects are that they are great propolizers, and rather cross in temper. Among my colonies I possess one which I imported myself from the neighboring country of Bulgaria. The bees of this Bulgarian stock are very probably allied to the Caucasians, because they are mild in temper and seem not to know the use of propolis and of stings. They are of rather small size, rather prolific, and not inclined to swarm. The sections which I have obtained from them are white, and well capped.

Please answer the following questions.

Is it true that some species of pine-trees yield nectar through a kind of insect, of the aphid family? I have heard some peasants of this country and of Greece assert this, but would not give credit to their assertions be-

fore I hear it supported by some more competent authority, especially as no pine-trees are found in my immediate vicinity to watch bees on; it is, moreover, said that a honey of delicate flavor and color is obtained from this pine-bred aphid.

My second question is about the chestnut-tree, of which we have plenty in this country. Does it yield any honey, and of what kind? I have seen bees work earnestly on them, but could not ascertain whether they were gathering honey or pollen.

Constantinople.

[The source of pine-tree honey is a mooted question. Chestnut honey is not very good. It does not seem to yield a great deal. It is better for pollen.—W. K. M.]

## NATURAL SWARMING AND RE-QUEENING.

### Prevention of After-swarms.

BY B. H. BRADLEY.

I am sending you a photograph showing 59 sections. The colony that produced them had 11 more equally good. I let my colonies swarm once, hiving the swarm with the old queen in a new hive, close to one side of the parent hive. Some of the bees hived with the old queen will return to the parent stock; but enough will remain to take care

A LOT OF FANCY HONEY IN 4×5 SECTIONS, PRODUCED BY A NATURAL SWARM.

of all the eggs the old queen can lay. If there are sections on the hive at the time the colony swarms (and there usually are), I leave them on. In eight or eight and a half days the young queen will hatch. Before it is time for the young queen to hatch I go through the parent hive, taking out all queen-cells but one, leaving the longest and best-looking cell to hatch. Some will say, "Suppose that one cell doesn't hatch." In all of the thirty years I have kept bees I never knew them to gnaw the wax from the end of a queen-cell unless that cell hatches. This is my guide, therefore, in determining which cell to leave. As soon as the young queen gets to laying I move the hive with the old queen, if honey is coming in plentifully, to the opposite side of the hive, thus adding greater strength to the parent hive, at the same time reducing the strength of the swarm with the old queen, which prevents the bees from swarming again, as they might do unless they were reduced in numbers in some way, or given more room. I find it more profitable to move them, thus getting their field workers in the parent hive. Almost any number of bees will stay with a *young* queen, with no desire to swarm, if given plenty of room in time. This is not true, however, with an old queen.

Since I began managing my bees in this way it has been no trick to produce prize honey, and lots of it.

Greene, N. Y., Oct. 28.

### PAPER WINTER CASES.

#### Some Conflicting Reports Concerning their Value; how to Prepare Paper Cases.

BY H. H. ROOT.

The verdicts do not all agree concerning the value of the paper winter cases. We have received quite a number of reports from those who have used such forms of protection for colonies during the winter, and the results indicate that the paper method is at least well worth trying.

The idea is not new. Mr. Arthur C. Miller recommended the use of papers some years ago, and it is a well-known fact that many bee-keepers are using them to-day. The cheapness of such protection should appeal to every one, although, of course, no protection would be economical which resulted in a loss of colonies during the cold weather.

Mr. J. L. Byer, in the *American Bee Journal* for November, thinks that, for his locality, the paper protection is simply "no good." He tried the plan several years ago, and found that his colonies packed in the ordinary way came through in fine condition, while those with the paper wrappers nearly all perished. In view of his experience he does not recommend the paper for even spring protection.

From this it is evident that the paper should not be used in all localities; and, to

be entirely frank, we believe that, if one has a system of packing whereby he can bring his colonies through the winter in uniformly good condition, he has the most economical

Fig. 1.—A colony in a single-walled hive prepared for winter by the addition of a heavy paper wrapper, under which are several thicknesses of newspapers covering chaff or straw placed directly on the hive-cover.

system that can be devised, and he had better let well enough alone.

But there are many who are obliged to provide protection for their colonies, but who hesitate about going to the expense of buying lumber and making outer cases. To all such we would recommend at least a trial of the paper wrappers.

We present herewith some additional illustrations to show more clearly the proper method of packing colonies for winter with paper cases. Fig. 1 shows a colony in a single-walled hive all ready for cold weather. The paper should be long enough to reach the ground to give the best results; and since the entrance would then be covered, a little of the paper should be torn away in front to give the width of opening desired.

Fig. 2.—The heavy paper raised and pushed back to show the newspapers beneath.

As explained in a former article, it is important to have the paper folded in such a way that water will be shed instead of directed into the fold of the paper. See page 1437 of the Nov. 15th issue.

Instead of nailing cleats on each side, it is

much quicker to tie simply a coarse string around the hive, paper and all.

In most cases it will not be sufficient to wrap but one thickness of paper about the hive. A little chaff or excelsior should be scattered around on top of the hive-cover; and if hay or straw is used, it may be easily pushed down over the sides and ends. Newspapers, pieces of old carpeting, or any similar material, may be laid over this packing. For the purpose of illustrating this part, the string was loosened and the outside paper raised to show the newspapers covering the packing material beneath. See Fig. 2.

Fig. 3.—Under the newspapers; excelsior or chaff is spread around on top of the hive-cover. If hay or straw is used, it may extend down on the sides and ends of the hive, providing extra protection.

In Fig. 3 the newspapers were rolled back to show the excelsior placed on the hive-cover.

## BEE-VEILS VARIOUSLY CONSTRUCTED.

### Wire-cloth Facing v. Celluloid or Glass.

BY E. R. ROOT.

When one goes over the country visiting bee-keepers he is almost sure to be surprised at the variety and complexity of the head-gear used. Like a great many other things, what one regards as simply perfect, the other would consider an intolerable nuisance—

THE ALEXANDER BEE-VEIL.

nay, he would prefer to have no protection whatever, with all the attendant stings, than to put up with some awkward contrivance that the other fellow uses. As it is impossible to make one shoe, hat, or coat suit every one, I am now submitting several different styles without any attempt to show them all, allowing the reader to select and make that which suits his fancy best.

First we will start with the simplest form of bee-veil—the one most commonly used. It is made of grenadine, brussels netting, or mosquito-bar, preferably black, in the form of a bag open at both ends. The top has a rubber-cord binding, and the bottom is bound by a silk ribbon. The smaller end is made to fit over the brim of any ordinary hat, and the other end is tucked into the coat or vest, or, when neither is worn, under the suspenders. The manner of adjusting such a veil is shown in Fig. 1. It slips over the hat, then the hands are passed under the suspenders in front, grabbing the lower end of the veil and drawing the edges as shown in Fig. 2. In doing this, care is taken to take up all the slack, front and rear, leaving the edges under the suspenders as shown in Fig. 3. When it is desired to remove the

Fig. 1.

Fig. 6.

Fig. 7.

Fig. 8.

RIGHT AND WRONG WAY TO FASTEN A BEE-VEIL HAVING A RUBBER CORD INSERTED IN BOTTOM.

veil, or to raise it for the purpose of inspecting eggs in a dark comb, or when it is very hot and the bees are gentle, it can be easily lifted as shown in Fig. 4.

The illustration above shows the same veil but with a rubber cord gathered in the top and bottom alike. Many apiarists work without suspenders, coat, or vest, using a belt to hold up the trousers. Such a veil, by means of a large safety-pin, is hooked into the belt or lower portion of the waist, also catching the rubber cord and drawing it V-shaped over the front of the waist as shown in Fig. 5. This gives perfect freedom to the arms, and yet holds the bottom of the veil drawn tightly over the waist, making it bee-tight.

One might suppose that the manner of adjusting it as shown in Fig. 6 would be just about right; but he will find, if he tries it, that it will interfere with moving his arms,

and in a few minutes it will slip up and hang loosely over his shoulders. Fig. 7 is a little better; but it ought to be drawn further, as shown in Fig. 5.

Fig. 8 shows a manner of fastening it to the waist, recommended by several bee-keepers. A long cord is inserted in the bottom end of the veil, leaving plenty of surplusage and two free ends. These ends are drawn across the front, around the back, and across, then back to the front, and tied. This makes a very nice arrangement, and is preferred by many. But it has the disadvantage of tying one's head up in a sack, and making it impossible for one to reach up without untying to pick out a stray bee that may be crawling over the face, or to wipe off the perspiration. The veil with an elastic bottom will allow one to reach up at any time without interfering with the fastening; and in my opinion it is much superior to the long loop-string plan.

With any of these veils it is important to have at least a facing, black in color, and something that will obstruct the vision as little as possible. A white veiling is hard to see through. The finest thing for this purpose is silk brussels netting. For many years, and especially for traveling, I have used a veil made entirely of this material because of the little room it takes up in the pocket. It is easy to fold it up and slip it into the vest pocket, and it takes hardly any more room than an ordinary watch.

But there are many who object to these loose-flowing veils, especially under trees or among underbrush, where they are likely to get caught and torn. Many a time under the shade of an old apple-tree have I suddenly found myself "hooked" to some little sprig, and it sometimes takes several minutes to untangle; and one is lucky if he does not tear the veil in doing it.

THE GLOBE BEE-VEIL.

POUDER'S CELLULOID-FRONT VEIL.

Of late there has been a tendency on the part of many honey-producers to go back to the old wire-cloth headgear of father Langstroth, such as he described in his "Hive and Honey-bee," published in the early 50's. Among this number is E. W. Alexander, who has adopted a headgear on the Langstroth idea, and the same is shown in Fig. 8. This is made up of special wire cloth of 8 meshes to the inch, black in color, and of so fine a wire as to obstruct the vision but very little. It is formed into a cylinder of suitable size, the top of which is covered with a gathering of muslin, and to the bottom is attached a skirt of the same material.

When I first saw Mr. Alexander and his men using this outlandish headgear I felt sorry to think that a man so progressive would be willing to be seen in such a thing, to say nothing of the inconvenience of using it all day long. I did not, however, express my feelings; but after some little persuasion on the part of my host I submitted to the ordeal of wearing one. At first I did not like it; but the longer I wore it the more I concluded it was not such an inconvenient thing after all. I continued to wear it, and finally came to the conclusion that it was one of the most serviceable and handy headgears it had ever been my lot to try.

The skirts fit loosely over the head and shoulders. The wire-cloth cylinder rests partly on the head and partly on the shoulders; and as it is made of stiff strong material the protector does not in any way touch the face. I soon discovered it was not necessary to wear any hat or cap; indeed, the white muslin top gave all the protection from the sun one would need, without any pressure on top of the head. As work in the bee-yard is usually performed in hot weather, this veil is very cool, because the summer breezes can circulate over the top of the head; and, what is more, there is no tight-fitting hatband from which the sweat will ooze in great drops.

While I have not tried these wire-cloth-facing veils extensively, yet I have talked with men who have; and I am convinced that for heavy work in the bee-yard it is a splendid and serviceable protection. There is no danger of getting it "hooked" on to a limb or twig, and no danger of having it torn, because both the muslin and the wire cloth are sufficiently strong material to stand any ordinary usage without damage.

But the feature of this veil that will be appreciated by many is the ease with which one can reach up under the skirt to get at the face to wipe off the perspiration with a handkerchief or pick off any bees that may be playing tag over one's bald head (my head is not bald). Another thing, it may be jerked off in an instant and laid on the ground, and it can be put on again just as quickly.

The illustration will show how the veil is made. I find a very good proportion for the veil is as follows: Wire cloth, 11 inches deep by 2 feet 7 inches long. This is rolled up into a cylinder and sewed together at the

back. The top is made of a piece of muslin 10 inches wide by 2 feet 7 inches long. This is drawn together and tucked into the form of a circle, the tucks running toward a common center, at which point there may be a small hole. The skirt consists of a piece of muslin 11½ inches wide by the same length as the wire cloth—2 feet 7. This is sewed to the bottom edge of the wire-cloth cylinder, and hemmed at the bottom.

There are some others who have recommended veils with a glass front, glued to the veiling material. Mr. Walter S. Pouder suggested celluloid; but both of these substances gather moisture from the breath, and thus totally defeat the object of their use by smearing up the glass or the celluloid so that it is impossible to see through it. The best material that I have ever tried so far is silk brussels netting or a fine grade of wire cloth.

For the very timid, a globe bee-veil seems to offer advantages from the fact that the protecting material is kept away from the face and head at all points, and the bottom securely locked around the neck by means of a metal band, the same also supporting the steel hoops that make up the globular shape, and hence the name. As a general rule this veil is not popular with the bee-keeper who is not afraid of stings, because it takes too long to put it on and take it off.

There are others, like the Coggsall, which combine a waist and bee-veil all in one. I will not give a description of this here, because it was shown in these columns, page 1497, Dec. 1, 1907.

### WEBER'S ENTRANCE-CONTROLLER.

How it is Used to Prevent Bees from Flying out on Bright Days, getting Chilled, and Dying.

BY C. H. W. WEBER.

When the hot weather is over, say at the end of September or in the beginning of October, supply your hives with the entrance-controller. Push the controller into the entrance between the bottom-board and brood-chamber, which should leave a space ½ inch high: leave the metal slide out of the controller; also leave off the attachment. By doing this there will be an entrance through the controller, 4 inches wide and ½ inch high, formed.

Toward the end of October, or in the beginning of November, when the nights become cold, bring the metal slide into play by placing the slide into the slot of the controller by moving the same to one side, so that the entrance becomes partly closed, and so that there will be an entrance of one inch formed for the bees to go in and out the hive. At the same time, place the attachment on the controller so that the one-inch entrance made by moving the slide to one side becomes fully covered, and so that at the same time a one-inch entrance is formed on the opposite end of the attachment. Thereby

the bees are at liberty to go in and out, thus not allowing the sun and light to shine into the inner hive, preventing, in this way, the bees from being drawn out by the sun or light to take a flight. Only the warm tem-

perature becomes warm enough for the bees to take a flight, then they could do so.

The entrance-controller should be closely fitted to the sides of the bottom-board so that no light will shine into the inner hive through the space which perhaps is made by not having it fit closely enough. If any such space is left it would have to be filled. Putty will answer this purpose the best.

You will be astonished when using this method to see how small a number of bees you will lose. Spring dwindling is mostly overcome.

Cincinnati, Ohio.

[This is the second year, if we are correct, that Mr. Weber has tested a device of this kind; and so satisfactory has been its operation that he secured a patent, the same being granted Sept. 24, 1907. The device, as will be seen by consulting the illustrations, consists of a general scheme for gradually contracting the entrance, allowing daylight to penetrate in moderate weather, when the bees can fly without being chilled to death; and later, when chilly or cold weather comes on, it permits of the closing of the entrance in such a way as to let in the air and yet shut out the light.

By referring to Fig. 4 you will see that the whole arrangement is turned upside down, although the illustration does not show correctly the true relation of the parts, but yet enough so to enable the reader to understand the general principle. When the entrance is closed entirely by the zinc slide in the central partition the air passes in at the point marked "bee-route," through the wire-cloth screen around the ends of the partition, back through the screen, and finally into the hive.

It may be questioned whether thus shutting in the bees so they can not get out would not, in some localities especially, result disastrously to the colony. All the experiments that we have conducted in our locality toward shutting off the light, and yet letting in the air, have resulted in heavy losses of bees, providing the bees themselves could not get out of the hive. It is our opinion that it would be better to omit the wire cloth in this controller entirely, because we believe that simply shutting off the direct rays of the light would keep all the healthy bees inside, while those that are diseased could escape, thus avoiding a general disturbance if they were confined, demoralizing the whole colony.

It will be noted that in moderate weather a wooden slide on the outside, in connection with the zinc slide in the slot of the central partition, can be staggered in a zigzag order in such a way as to exclude the direct rays of the light, and yet allow the passage of the bees back and forth.

It will be remembered that nearly two years ago Mr. A. J. Halter, of Akron, Ohio, following out the suggestions of Mr. Doolittle, made some time before, showed how in this climate he leaned a board up against the hive, shutting out the direct rays of light, and yet making it possible for the bees to pass in and out at any time (see illustration). His theory was that, if the light were shut

perature would cause this. In other words, only the atmosphere of 60 to 70 degrees Fahrenheit would cause them to take a flight, and thereby prevent them from becoming chilled.

When the weather becomes very severe, below zero, you move the metal slide so that the entrance becomes closed, so that there is perfect night darkness in the hive. This darkness will keep the bees quiet. The se-

vere weather will not affect them, with the direct entrance closed up, while a steady supply of fresh air through the air channel at each end will make the hive more comfortable for them.

When the weather moderates, remove the slide to the side again, so that, when the tem-

out, there would not be much flying on the part of the bees on bright sunny days, yet having an atmosphere too cool to allow them

HALTER'S STORM-DOOR OVER ENTRANCE FOR OUTDOOR WINTERING.

to fly out and thus get chilled. We are testing this idea this winter, as well as the contrivance of Mr. Weber, also shown.

Time and again we have noticed that, with the ordinary hive-entrance, perfectly healthy bees would fly out on cool or cold days, become chilled, and die by the thousands. Those lured out by the inviting sunshine were scattered around on the ground for several rods within the vicinity of the apiary; and so thick have they been that one could scarcely walk without stepping on bees. A cold spell following on without any warm weather intervening would be very certain to kill all these bees, and the colonies losing them would suffer very heavily in consequence.

This last fall our Mr. Pritchard reported the north yard had unusually strong colonies during October; but a late inspection in December, when it happened to warm up, showed that they were fearfully reduced in numbers. These had no entrance-controlling devices, and the presumption is that the bees flew out on deceptive days and died, for we had many such days last fall.

The loss from bees flying out this way is not so marked in very cold localities as it is where a more moderate temperature prevails. A bright sunshine will often fail to warm up a chilled atmosphere. It looks all right to the bees outdoors. They come out, discover their mistake too late, and die.

We regard this as a *very important* subject, because in localities on a line just between the outdoor wintering portion of the country and the indoor, there are severe losses just from this source. Many times a colony will lose two-thirds of its force, even before the first of December; and then, of course, it dies before spring. In other instances colonies that have done well through the winter suffer heavy losses in the spring because of this (to them) peculiar spring that invites the bees out where they die by the thousands.

We hope that Mr. Weber or Mr. Halter

will be able to solve this problem in a practical way. While Mr. Weber's is a more complicated device, it may be, when intelligently handled, far more effective.

Hello! here is something more on this interesting subject.—Ed.]

#### HOW TO PREVENT ENTRANCES FROM BECOMING CLOGGED IN THE WINTER.

Last winter I packed my bees, two colonies, side by side in a packing box with a  $\frac{3}{8}$ ×8-in. entrance leading straight into the hive; but I found that the bees clustering down to get more air actually shut off an already insufficient supply. In GLEANINGS for Nov. 15, p. 1438, Mr. Latham writes that it is very important to have the winter entrance directly opposite the cluster; so this winter I have a part of my colonies arranged with the summer entrance  $\frac{3}{8}$ ×12 in. bridged full width out to the packing-box wall, then the  $\frac{3}{8}$ ×8 entrance cut in the packing-box. It seems to me that, with this arrangement, it would be impossible for the inside entrance to get clogged with dead bees or ice. There would be no damp corners in the front part of the hive. Air could reach the cluster direct, no matter what side of the hive they are in, and the whole front of the hive could be cleared of dead bees and filth at any time if need be. The distance from the wall of the packing-box to the hive is 3 inches. Will any more air get into the hive with this arrangement? It looks colder to look in at the entrance. Is there any thing about this that would be detrimental to the bees? H. D. MCINTYRE.

Galt, Ont., Nov 1.

[The arrangement of the vestibule shown in the illustration, while perhaps not showing the exact arrangement mentioned by our correspondent, we should consider excellent.

MCINTYRE'S WINTER-CASE AND VESTIBULED ENTRANCE.

It is not entirely clear whether the bridge covering the entranceway from the inner hive to the outer casing is on a level with the cover, or just barely above the entrance. We should consider that it would be better to have it elevated about 3 inches above the entrance so as to make a sort of inclosed vestibule. This arrangement would catch the air

currents, catch any dead bees any time they accumulate, and at the same time to a great extent shut out the direct rays of sunlight on a bright day. As mentioned elsewhere, this would be very desirable. Answering the question of our correspondent directly, we would state that, in our opinion, the arrangement would prove to be very satisfactory. At all events, will he report the result of the experiment next spring?—Ed.]

#### A DOUBLE HIVE-BOTTOM FOR WINTER PROTECTION.

*Mr. Editor:*—The drawing illustrates a combination of two bottom-boards used as a preventive against cold drafts, bees flying on cold sunshiny days, suffocation from having the entrance clogged with dead bees or ice, and spring robbing. This combination is made of my old bottom-board and a new one having its floor loose (both are the standard 10A Danzenbaker style, which can be used singly if this experiment fails). The loose floor is shoved along until it projects about  $\frac{3}{4}$  inch beyond one end of the new bottom. This projection is sawed off and reinserted in the place where it was shoved from, which gives us a plan to make the entrance from the lower bottom. The strip is fastened tight, and the loose floor is shoved forward, making an opening any width, and mouse-proof if desired. The opening between the sawed-off strip and under the back of the hive is closed perfectly by using a piece of one of the cross-sticks left out from an R cover. At the beginning of the swarming season I will remove the upper bottom, leaving only the lower one with its wide entrance.

The benefits that could be derived from

DOUBLE BOTTOM-BOARD TO PREVENT THE ENTRANCE FROM BECOMING CLOGGED IN WINTER.

such a board are, I think, many—first, cold drafts in early spring prevent the spreading of brood to the lower part of the hive. This is overcome by the large vestibule formed

between the two bottoms (this point is not an experiment). Second, to take away the direct vision of light during cold sunshiny days prevents bees from being lured out to get chilled and die. The vestibule also answers for this purpose. Third, robbing can be prevented by bewildering the robbers; therefore when robbers make a rush past the first opening, and find themselves not in the hive, they act strangely bewildered. The guards notice this strange performance and promptly set upon them. Fourth, a bottom having such a wide opening at the front and a wide narrow entrance to the hive could not very well be clogged with dead bees or ice. I hope you will try one or two of these combinations so that you will discover, as well as myself, whether there is any benefit gained by using such a board. I am sure there is nothing lost. JOSEPH F. ROSE.

Washington, D. C.

[We should consider this arrangement very simple, cheap, and excellent. It possibly might retain all the advantages of the Weber arrangement. It is so simple for one to carry that we suggest that a number of our subscribers try it and report. We shall certainly test it in our own yards with all the arrangements here shown.—Ed.]

#### FEEDING IN THE FALL.

**Thick Syrup Needs No Acid to Prevent Granulation; No Loss after Years of Experience with a Syrup Made in the Proportion of Two to One.**

BY J. L. BYER.

On p. 1488, of the Dec. 1st issue, both the editor and the genial Dr. Miller seem to think that, because I fail to see any advantage in feeding syrup as thin as equal parts of water and sugar, I occupy a very untenable position. In view of what has been written about the liability of thick sugar syrup granulating, it is not to be wondered at that a statement of that nature should be treated as unorthodox and rank heresy. You will pardon me, and I assure you there is no intention of being impolite, when I say that all such assertions as far as wintering results are concerned (in our locality), are so much "bosh."

Upon what do I base such a broad statement? I answer, from practical experience, and result of feeding thousands of pounds of two-to-one syrup to hundreds of colonies during different years, without the loss of a single colony so fed. The only severe winter losses we have experienced were caused by the presence of honey-dew in the hives, and the labor factor is the only thing that keeps me from feeding every colony, every fall, with this *dreadful two-to-one mix-*

ture. With colonies so fed I would not give five cents a hive as insurance against winter losses. Under certain conditions, in exceptional cases, thick sugar syrup will granulate, but so will good clover honey. Can either you or the good doctor make the positive assertion that, under like conditions, syrup that was fed thin will never granulate?

But, as has been pointed out, this granulation in the rare cases mentioned cuts no figure so far as actual results in wintering are concerned. Aside from this the advantages of feeding the thick syrup as compared with the thin article are so great that I would not think of feeding the latter, at least until better proofs of its superiority are given me than have so far been forthcoming. This fall some 3000 lbs. of sugar were fed to three apiaries in a little over two weeks. If thin syrup had been used, two operations would have been necessary instead of one to each colony, and the feeding operations proportionately prolonged. Feeding when I did, quite early, all the syrup was sealed over; while if the thin syrup had been fed later a large amount of it might have been left unsealed to ferment later on.

Referring to the fact that bees make chemical changes upon the sugar syrup before it is fit for food, Dr. Miller asks if I think they can change my two pounds of sugar to one of water as easily as they can syrup as thin as nectar. For answer I would use the doctor's own handy phrase, "I don't know," and, what's more, I don't care how or how much they change the chemical constituency of the thick syrup so long as they winter splendidly on the same.

I am also asked if I can add the acid necessary to keep this thick syrup from granulating, as well as the bees can impart this requisite when fed the thin syrup. In all my feeding of bees I have never added an ounce of acid in any form; and I believe the addition of the same to any pure sugar syrup is entirely unnecessary.

So good an authority as our friend W. Z. Hutchinson comes out strongly on this point in the November *Review*; and were it not for such strong testimony from so well known an apiarist, probably the writer would not have dared to record such unorthodox statements. For fear that some readers of GLEANINGS may not see the *Review* for November I can not forbear making a short extract from the editorial of Mr. Hutchinson's referred to:

Sugar syrup for feeding bees does not need the addition of tartaric acid, vinegar, or honey, as recommended by some, to prevent granulation; at least, that has been my experience, and I have fed barrels and barrels of sugar, beginning as early as Oct. 1, and continuing the work until nearly the middle of November.

While the consistency of the syrup fed is not mentioned, any bee-keeper knows that a thin syrup would not be fed to bees by W. Z. H. as late as on dates given.

On the spur of the moment I could name at least half a dozen successful apiarists who feed the thick syrup extensively and exclusively, and all with good results; so is it any wonder that I continue to pay no attention

when told that, unless acid is added where such food is used, granulation will take place and the bees will starve? Give me positive results, doctor, as to the superiority of your formula and I will fall into line instantler.

Mount Joy, Ont., Can.

[If we implied (we certainly didn't mean to) that our correspondent was teaching heresy we are glad that we did so, as otherwise we should not have had this vigorous rejoinder. The editor may be wrong on the proposition that a *thin* rather than a thick syrup should be fed. At any rate, he is always glad to have his views assailed by an opponent who is able to present an array of such good argument as has been presented above. We are frank to confess that we may be wrong; and that we are open to conviction will be apparent from our footnote given on p. 32 of our last issue on this subject *before* we saw Mr. Byer's point of view. And right here it is proper to observe that he has, in addition to the others mentioned, Mr. Alexander on his side.

We shall be glad to get more facts bearing on this question of thick or thin syrup, and in this connection we will say that thick syrup, so thick that the bees could not change it, and fed all in one big feed, gave us uniformly good results, but not better than a syrup fed thin. The question is open for discussion; but let us have *facts*.

But say, Mr. Byer, we never advocated putting acid of any kind in *any* syrup. On this we will join with you as against Dr. Miller *et al.*—Ed.]

## MICHIGAN STATE CONVENTION.

### Honey-strainers in Extractors, Smokers, etc

BY R. F. HOLTERMANN.

In a private conversation with Mr. L. A. Aspinwall at the Michigan State convention, Saginaw, he gave me one idea which, in my estimation, will amply repay me for the expense and trouble of my trip.

#### HOW TO GET RID OF MOISTURE IN A CELLAR.

Mr. Aspinwall told me that, if I would build a bee-cellar, I should make a portion of the floor above of strips, with spaces between; upon this, put a thin muslin cloth, and over this fairly fine planer-shavings or chaff, say to the thickness of three inches. In this way the moisture can escape from the cellar through the shavings and yet the warmth of the cellar be largely retained. When I was home I made a frame of lumber four inches wide, a little longer and wider than the cellar trapdoor. Over this frame I stretched a piece of cheese-cloth strengthened by bands of strong cloth. The cloth was put on the under side, and the planer-shavings into the tray until no light could be seen from below through the shavings, when all was placed over the trapdoor opening to the cellar. If the temperature of the cellar gets too low I will add to the thickness of the shavings. In this way I feel sure I shall get

rid of a lot of moisture with a minimum loss of heat.

Those who know Mr. Aspinwall believe him to be one of the most careful and thorough apicultural investigators the world has ever known. The revolution which has come about by his invention of automatic potato machinery alone entitles him to be heard with a measure of confidence. Mr. Aspinwall reported at the convention that, owing to rheumatism, he was unable to give his bees in his "non-swarmer" all the super room they should have. Many colonies had built brace and burr combs, being so crowded; yet, even under these circumstances, only one colony out of thirty-one had swarmed.

#### COÖPERATIVE EXPERIMENTS.

After an address by the writer it was decided that members would undertake coöperative experiments. Mr. R. L. Taylor suggested that the first work be to learn to what extent, if any, the following conditions would cause the bees to fill and cap the sections in the outside row of the supers as soon as the more central rows.

The conditions were, to have two bee-spaces divided by a separator between the last row of sections and the side of the hive; also to raise the brood-chamber  $\frac{1}{2}$  inch at the front from the bottom-board closing the opening (made at the side) by means of a wedge, the object being to compel a larger percentage of bees to go up the sides of the hive and thus reach the outside sections first. Mr. Elmore M. Hunt, Redford, Mich., the hard-working secretary of the association, was elected director of the work, and any one desiring to join in this experiment should write Mr. Hunt.

#### THE BEST SPEED FOR RUNNING AN EXTRACTOR.

Mr. E. E. Coveyou, Petoskey, Mich., wished to see some tests conducted to ascertain the best speed at which to run extractors, also to find out the best temperature of the combs to be extracted. He heated his combs artificially after hauling them to a central station from out-apiaries. Work as to speed, etc., is all haphazard at present, and often five to ten per cent of the honey is returned to the hive. It was pointed out that bees could not store honey in the extracting-combs returned to the hive until the combs had been cleaned up by the bees; and the more honey that adhered to the combs, the longer it took the bees to prepare them. When extracting during a honey-flow this might result in a loss of honey.

#### A STRAINER INSIDE OF AN EXTRACTOR.

Mr. Coveyou is very enterprising, and is not only willing to adopt any good suggestion given in bee-journals, etc., but has the ability to improve on them or originate ideas of his own. He is using the system of straining inside of the honey-extractor, invented by Holtermann. Like myself he heats, when desirable, the unstrained honey on the bottom of the can between the cone side and the side of the can, but has improved the

method by using a double bottom to the extractor and having water between. He has also improved the rubber tube I used to conduct honey from the strainer to the barrels and 60-lb. cans by having at the mouth of the tube a stop like those used at the mouth of a syrup-jug.

He thinks, as I do, that the strainer is made much less valuable by having it reach across the can where the unstrained honey can not be warmed, and where all refuse rests on the cloth when the honey is strained. Mr. Coveyou washes the cloth on the cone strainer with warm (not *melting* hot) water, and then brushes with a whisk any particles on the cloth. In this way he never removes the cloth. Messrs. Coveyou and Holtermann expressed in no terms of doubt their opinion that the strainer is a desirable feature in an extractor, and that any one who has once used it will not want to do without it.

Mr. Coveyou pointed out a weakness in honey-gates, as made at present. They will not stay open at a desired point, but either fall down, closing the gate, or, when opened until the handle is thrown back more than above the point of attachment, they fall clear back and hang down, falling into the issuing stream of honey, resulting in many objectionable features. He thought bee-keepers should find out what would be desirable features in goods, and then compel the supply dealer to give it.

#### VALVELESS SMOKERS RECEIVE ENDORSEMENT.

The Root valveless smoker, recently introduced, received unstinted praise. A valve in the bellows was pronounced *unnecessary*—often a source of loss of air when using it. The new hinge connecting the barrel and nozzle, having a measure of play to it, was pronounced a great success. Mr. Holtermann stated that he had four makes of smokers, and that this new smoker was the first one to be used.

#### COMB-HONEY SUPERS.

Mr. E. D. Townsend advocated a drawn-out comb for each side of the comb-honey super. This prevented a large percentage of swarming, and tended to give greater uniformity of finish of sections.

Mr. Aspinwall advocated continuous passageways between brood-frames and sections—that is, the passageway between the sections should be directly above the passageway between the brood-combs. In this way the ventilation is better, and the bees can go up in a straight line to reach the sections.

#### QUEEN-CATCHER.

Mr. Aspinwall showed a queen-catcher consisting of a 14-gauge wire bent in a circle  $\frac{1}{2}$  inch in diameter inside, dipped in wax, with a handle. He had not caught a mated queen in his hands for five years. He put the circle about the queen on the comb, and with very little effort she could be induced to step on the wire, when she could be lifted up.

## BEST INVENTION.

Mr. Coveyou exhibited a balance by means of which any desired package could be filled; an electric bell then rings automatically at the same time the honey-gate is closed. This invention received the first prize.

It is fully expected—in fact, the president of the National, Geo. E. Hilton, and the Secretary, W. Z. Hutchinson, who was president of the Michigan State Association—stated that Vice-president Geo. W. York and Manager N. E. France all were decided that Detroit will be the next place of meeting of the National. Michigan will do its part to make a success of that convention.

President, vice-president, and secretary elected were Messrs. L. A. Aspinwall, E. D. Townsend, and Mr. Hunt. Mr. F. J. Miller, president of the Ontario Bee-keepers' Association, attended the convention, and was an advocate of hauling combs for extracting to a central point, and there extracting by means of a gasoline-engine.

Brantford, Canada.

SWARMING; ITS PREVENTION BY THE DOUBLE-QUEEN PLAN; SUPERSEDING OLD QUEENS.

*Mr. Editor:*—I have been very much interested in the recent correspondence of Mr. Alexander in regard to his double-queen system and the keeping-down of swarms. My most successful plan, if they persist in swarming, is to unite the swarms, that is, put two swarms in each hive regardless of the age of the queen. They work nicely together until the first super is filled, and then I space them; but when the honey-flow is over, the older queen generally comes out with the bulk of the old workers; and if they cluster conveniently I proceed to hive them, catching the queen, pulling off her head, and the workers return to the hive when the work is done. This leaves me the best queen. I have tried the cutting of queen-cells, but it will not work here, as it makes the workers cross and sullen.

## ABSCONDING SWARMS.

I was interested in Mr. G. C. Greiner's letter in Dec. 1st GLEANINGS in regard to absconding swarms and their sending scouts. As I live in a swampy country I have had varied experience along that line, though I never had a swarm run off if the queen was two years old. Virgins or young queens give me some trouble, and they do not always cluster here before they go to the woods. I have had them swarm, cluster, be hived, run off, and hang on a limb for a week when

there were hollow trees near them. Queens are like men—they are different in mind. If I make a young queen mad in hiving a swarm, if she is not clipped she will invariably go to the woods.

C. L. BODDIE.

Nashville, N. C.

## A BEE-KEEPER'S EXPERIENCE AT A FAIR.

At the Chester County fair I had an exhibit of bees. There was a very good fair, but no great inducements were offered for the bee-man. I wanted to get the people enlightened in the bee business.

No one had any bees but myself. I had a hive of five-banded goldens, and they were quiet, and could be handled without smoke or gloves, turned about without fear, and were unusually quiet. I had a comb in an observation hive, and I had a very large crowd around me most of the time. I demonstrated that bees could be handled without fear of being stung, and at any time. I was asked all sorts of questions, and you may judge what a good time I had all to myself. Just to think that there are so many people who know nothing about the workings and the habits of the bee!

Morstein, Pa.

WM. Y. STACKHOUSE.

## MOVING BEES IN HIVES WITH OPEN ENTRANCES.

Having read of a number of accidents in moving bees by the bees getting out and stinging the horses, I will give herewith the method used by Chas. Adams, of Greeley, Col. He first gives the colonies that he intends to move a thorough smoking, then nails the bottom-board fast to the body of the hive, and loads them into the wagon, leaving the entrance wide open. If any seem to be restless they are smoked a little more. I have been with Mr. Adams about a year, and have helped him move a good many bees for quite a distance—ten miles sometimes—with never a bit of trouble nor any broken or melted combs.

LEONARD GRAPER.

Greeley, Col., Nov. 25.

[We have no doubt that the plan of moving bees with the entrances of the hives open is a very good one, and yet at the same time we always hesitate about advising a beginner to attempt this. There are many who move bees in no other way, but yet there is always quite a possibility that, if a beginner were managing the moving, a stray bee might escape and perhaps sting one of the horses, when a serious accident would surely take place. From reports we have received it has seemed very necessary, when moving colonies with the entrances open, to keep the team moving steadily. If there is a stop there is more of a likelihood that the bees will issue from the hives.—Ed.]

## HOW TO MOVE OFF NO. 2 OR UNSALABLE COMB HONEY HAVING A GOOD FLAVOR.

After seeing the above heading, page 1558, I thought I would give the plan I followed

the past season to sell such comb honey. All sections not No. 1 were cut out and placed in Mason quart jars, two sections to the jar. The jar was then filled full of extracted honey of a fine quality, and sealed with a neat label containing my guarantee and name. *If you live up to your guarantee your name will sell your honey.* I speak in regard to the local trade. When rightly handled it is the best market we have. I placed this with the grocer at 20 cts. per lb., 3 lbs. to the jar, 60 cts. per jar. This will dispose of the off sections and quite an amount of extracted honey at a good price. Mannington, W. Va. B. A. AMMONS.

[The plan here spoken of is excellent. It is the same that is used in Texas, only pails are used instead of glass.—Ed.]

#### A BUGGY-SPRING HIVE-SCRAPER.

I have been using a cheap and practicable hive-tool which can be made of a wagon or buggy spring. The broken end of a spring can generally be found at any blacksmith shop, and the thin end can be filed sharp for 10 or 15 cts. Have it sharpened as per the

illustration, the thin end sharpened and one side about two inches back, to be used as a scraper or screwdriver, and the thick end can be squared on one edge to drive a nail with. I find it very handy for all purposes around an apiary. VIRGIL P. CUTLER.

Canon City, Colo.

#### THE RELATIVE POSITION OF THE BROOD AND HONEY DEPENDS UPON THE LOCATION OF THE ENTRANCE.

In the Nov. 15th GLEANINGS, page 1435, I notice the writing of Bro. Hand in regard to the position of honey and brood in a normal colony of bees, and it seems to me that he is mistaken, to some extent at least.

Mr. Hand refers to bees in a normal state unrestricted by man. Very well; we will take our ax and go to the woods, and here we have a bee-tree with the entrance high up at the extreme upper end of the cavity. Upon examination we find brood at the top and honey below; next we find a tree with an entrance at the lower end of the cavity. Upon examination we find brood at the bottom and honey above. The fact is, bees pre-

fer to store honey away from the entrance, regardless of other conditions. As our hives usually have the entrance at the bottom, the honey is usually stored at the top, or above the brood. If Mr. Hand will take notice he will find that the end of his brood-frames at the back end of the hives usually contains more honey than the end nearest the entrance—at least that is the case here in Texas. Sabinal, Texas. GRANT ANDERSON.

#### TRANSPARENT WRAPPERS FOR COMB HONEY; RUBBER BANDS TO HOLD THE PAPERS IN PLACE.

In the Dec. 1st issue, page 1499, I see an article by H. A. Sackett in regard to using transparent wrappings for comb honey. I also note the editorial reference to butter-paper. I have used it for wrapping fancy comb honey in  $4\frac{1}{2} \times 4\frac{1}{2}$  plain sections, and find it answers nicely and makes a very neat package. Instead of mucilage or glue I use a small rubber band placed around the section after the ends are folded down. I find these answer every purpose, and the combs can be inspected at any time without destroying the wrapper. I usually cut a diamond-shaped opening in some of the papers, and these I set next to the glass in the cases, so that the color and quality may be seen without opening the case. G. W. BYERS, JR.

Dundee, Oregon, Dec. 10.

#### CAUCASIANS CROSS; PLURAL QUEENS NOT AN UNQUALIFIED SUCCESS.

I have a Caucasian queen, imported direct myself; and, notwithstanding I opened her colony and passed out the frames for 156 high-school students to look at and handle, they are, at times, very vicious. They came through last winter all right, and are very strong at present. I have also some imported Italians which are very vicious, but wonderful workers.

Many years ago I tried a plurality of queens at various seasons of the year. About 30 per cent would hold out in the honey-flow. Except in case of supersedure I never managed to keep two in a hive only as above mentioned, and I tried it many times with brood and without and in all ways. A No. 1 vigorous queen with energetic and long-lived offspring suits me. DOUGLAS D. HAMMOND.

Truro, Ia.

#### TWO QUEENS IN A HIVE.

If two queens in one hive are separated by perforated zinc, does one of the two show up missing in the fall? J. L. ZEINZ.

Chicago, Ill.

[Yes, as a general rule, if there is no fall flow of any kind.—Ed.]

#### RED POLLEN FROM ASTER.

The bright-red pollen in our parts of Pennsylvania, 28 miles north of Philadelphia, comes from fall aster. My bees brought it in up to the middle of November.

Souderton, Pa.

M. B. BERGUY.

## OUR HOMES

by A. I. ROOT

I will instruct thee and teach thee in the way which thou shalt go: I will guide thee with mine eye—  
PSALM 32:8.

Those who are young and well should bear in mind these notes are mainly for elderly people, or those who feel their strength and energy are failing. Of course, these talks may be useful in holding up a warning to those who are young and strong, for you know that, to be forewarned, is to be forearmed. After I purchased the one acre near Bradentown I wrote friend Rood asking if it would be possible for Mrs. Root and me to get a couple of rooms in the neighborhood, so we could be near by while our house ("cabin in the woods" No. 3) was being built. He replied he knew of none; but if we two were willing to accept their every-day fare they would try to accommodate us in their own home. We finally arranged that I should go on ahead and build the house, and let Mrs. Root come later.

Let me here remind you, dear reader, that I have been writing these Home Papers for more than 25 years; and during all this time I have been studying with intense interest the homes where our people live and where our children are brought up—not only American homes, but I have studied *also* with intense interest the homes of the people in Canada, Cuba, Bermuda, and every other place when and where an opportunity offered. You can understand, then, how I rejoiced at an opportunity of getting a glimpse, at close range, of the home life of some of the best Christian people I have the honor to number among my friends.

Now, every family has its own peculiar ways and notions. Like people, they have an individuality. For instance, Mrs. Root and I have all our lives been in the habit of getting up early, say 5 o'clock or earlier, the year round. We have our breakfast over and put away, often before our children and grandchildren are up. Mind you, I don't say our way is the *best*; but we got used to it on the farm, and rather liked to keep it up.

Now, *please* don't you, any of you, think I am finding fault and feel hurt when I tell you how a great blessing came to me when I least expected it. I shall always thank God for having given me the privilege of getting a glimpse of the home life of such a family as that of dear brother Rood's; but when I found that their hours for meals were an hour later, and sometimes more than that, I at first felt a little fear lest I might not feel as well under the arrangement. Mr. Rood is up fairly early, gets all his men at work, and the general business of the day well under way, and then comes in to breakfast. After quite a little work outdoors before

breakfast, all have good appetites, and we have a rather long breakfast, with lots of visiting and much merriment. Everybody has a chance to "*chew* his food" thoroughly.

Well, when breakfast is ended, instead of rushing off to work brother Rood gets a whole armful of bibles, and we read around until we finish a chapter—that is, unless the chapter is very long—closing with prayer. Let me say here that Mrs. Root and I have had bible-reading and prayer all our lives, after breakfast, but we read only a few verses; and when things are rushing the prayer is often very brief. Well, Mr. Rood is one of the busiest men I ever knew. He has his strawberries, lettuce, and cauliflower by the acre; then he has charge of eight or ten *aparies*, deals in real estate, loans money, and I don't know what else. Yet with all this business he deliberately drops every thing and gives his *Maker* the very best part of his energies, right out of the early forenoon. I am sure he and his beautiful bright family will forgive me if I confess that at first I felt worried for fear he was giving *too much* attention to God's holy word in the very best part of the day. Why, it is almost funny, when you come to think of it, to hear of a man who is an educated lawyer (and a bright one too) having so much *bible* in his home that *A. I. Root* felt worried.

Well, just before noon he takes his berries to market (carrying *strawberries* to town the day before *Christmas*, for instance); and as everybody seems to want his advice or something, he seldom gets home until a pretty late dinner hour, and with supper it is much the same. Do you wonder that very soon I began breathing my little prayer, "Lord, help me to learn the new lesson thou art striving to teach me"? Did you ever try to drive an excited hen into the very place where she could find food, water, and every thing she was in great need of? Well, you and I are often like that hen. We grumble and complain, and act contrary, until we find the imagined hardship or calamity was one of God's choicest blessings. Well, when Mr. R. was sometimes unusually late, and I felt too much used up to work or read, I *finally* decided to take my noonday nap before instead of after dinner, and was amazed to find I was not *particularly* faint or hungry after the nap. I did the same thing in the evening, and then my appetite began to increase amazingly. Then it occurred to me that my very warm friend Dr. Salisbury told me, almost forty years ago, that it would add years to my life if I would take a good rest lying down, and, if possible, a short nap before eating a meal. Of course, one is expected to be well rested before breakfast; but he said the digestive machinery could never do good work when one comes to his meals exhausted and tired out. For years past I at times feel so used up before dinner time that

\*Our pastor said last evening (at our Wednesday-evening prayer-meeting) that God planned to take the children of Israel into the promised land by a short quick route, but owing to their obstinacy and "stiff-neckedness" the best he could do was to get them there in *forty years*.

it is really painful to do either mental or physical work until I have my dinner.

Well, it was one of my "happy surprises" when I discovered that it was *not* lack of food that made me feel faint, but lack of rest. One noon, after getting my nap, I ran over to give the carpenters some directions, and then "got busy" with my chickens, and actually forgot I hadn't been to dinner. Mrs. Root didn't find me, and told the rest not to wait; and when I told them I hadn't been to dinner I found I was just feeling fine without any.

Another thing, I do not think I ever enjoyed my daily food, at any time in my life, as I do now; and I am resolved from this time on to avoid sitting down to any meal, if it can possibly be helped, until I am thoroughly rested, especially after I have been doing much fatiguing work of any kind. Think of asking the delicate and complicated machinery to do the work your very life and existence depend upon when you are too much used up to do any thing but sleep.

Yes, I know what a lot of tired women and some others will say to my great "discovery." My excellent friend Mrs. Rood (and she is one of God's jewels) said when I was talking about this very thing:

"Mr. Root, just think of my taking a nap before dinner, with all this family to look after at such a time."

I replied, "My dear good friend, when you feel you are failing, just force some one to take your place, exactly as you would do when the doctor, a little later, tells you to go to bed and stay there until he says you may get up. Twenty minutes or half an hour before meals may cost something *now*, but nothing like what medicines, doctors, and possibly funerals, will cost later."

Christmas morning I wrote to the Medina people that my 68th Christmas morning was certainly the happiest if not the "merriest" of any in my recollection.

While making these statements I recognize, or try to, that this outdoor life, with the sea breezes from the Gulf always around me, may be quite a factor in giving me health and enjoyment. In my *after-dinner* naps I often awoke, even here in Florida, with a bad taste in my mouth, and a dull feeling, until I had stirred around a little. After a nap *before* eating there is nothing of the kind. On the contrary, I invariably wake up with an exultant feeling and a disposition to shout, "Praise God, from whom all blessings flow," and "Is not this the land of Beulah?" By all means take this noonday nap in the open air if possible. On account of flies (and at times mosquitoes) I sleep before a wire-cloth-covered window. This window is low enough so my pillow can be pushed over on the sill; and one of the delights of living is, to me, feeling the delicious cooling breeze across my face as I lapse into unconsciousness.

#### BLOWING OR BREATHING WELLS, ETC.

Mr. A. I. Root:—I read with interest your account in GLEANINGS of your visit to Wind Cave, and note

what you say in regard to the air going out and in, and also that there are other places that exhibit the same phenomena. I thought then I would sit down and write you about the wells in this part of the country, but have not done so till now. I live in what is known as the semi-arid country, being located in the northeast corner of Colorado. In countries where the rainfall is light, water is not usually found near the surface unless it may be springs on low ground, and these are not dependent on rainfall, as the moisture that supplies them comes from long distances, sometimes hundreds of miles. In our county (Phillips) the depth to water varies from 25 or 30 ft. up to 250 or more, owing to location. Just around where we live, the depth is from 150 ft. to 175. When water is obtained it is in a bed of sand or gravel, and is usually found in unlimited quantities. Before water is reached, there is more or less gravel. This is because of being below where rain ever reaches; and above, the strata that supply the water are dry. Indeed, it is often found with scarcely a trace of clay in it; and in boring or drilling wells this gravel will slide or roll in from the sides as fast as it is lifted out, just the same as if you tried to go through a pile of wheat.

These bodies of dry gravel vary from a few feet in depth to sometimes nearly 100 ft. In the writer's well we went through nearly 100 ft. in one body in which there was not enough clay to make it stand alone. If there is any way for air to reach these bodies of gravel it will, of course, fill up all the air-spaces.

When I first came west I heard of the blowing wells, and many and absurd were the theories as to the cause of their blowing and sucking, for the air goes out and in just as you say at Wind Cave. People soon learned to forecast the weather by the wells. I began to study out the cause of the air at times coming out and at others going in. Later I read how all our changes in weather are preceded either by a high or a low barometer, and at once decided that I had solved the mystery. The solution is simply this: When what is termed a high barometer passes over any part of the country the air in that part is more dense, and is, of course, heavier. The air among the particles of gravel below the surface, not being of the same density, the outer air will naturally pass down into the well to equalize the pressure. When the "high" passes over, and a "low" takes its place, the reverse will follow; and in proportion to the intensity of the "high" or "low" will be the current of air going out or in; and I might add, too, the volume of space to be filled below the surface modifies it.

If the opening between the two be large the current of air may be scarcely perceptible; but if confined to a small opening it is at times very strong, as noted in your remarks about Wind Cave.

Our wells here are mostly drilled, usually not over 6 to 8 inches in diameter. With this space the current is sufficient at times to lift a light hat when held close to the opening. When the pump is in, and the well covered, sometimes the opening left will not be larger than a pencil. At times the air will pass with sufficient force to make a whistling or roaring that can be heard at a distance of 50 to 150 ft.

Now as to foretelling the weather, we have learned that, when our wells blow, we may look for a wind-storm from the northwest, with colder weather. The severity of the storm will be indicated by the force of the current coming from the wells. If the air goes in, look for warmer weather with southern winds. The change is indicated, usually, about 10 to 12 hours preceding.

You spoke in one place about ice in wells. I know of a well half a mile from where I sit, in which one winter the iron pipe (pump) was frozen sufficiently to burst 130 ft. below the surface. This may look like a western lie; but in view of my explanations above, should the air be entering rapidly, and a very low temperature, it might as readily freeze there as higher. We generally do not have these extreme conditions. We have, however, a good deal of both with pumps freezing in the winter; but by making a small vent 15 to 25 ft. below the surface, and covering the well closely, the difficulty is reduced to a minimum.

I have written this out fully, as I find but few, even in the West, who understand why wells blow.

Holyoke, Colo., Jan. 8, 1907.

K. M. AIKIN

Many thanks, friend A., for your interesting description of these "breathing wells." Your theory as to the cause is, I think, reasonable, and in agreement with the conclusions of science.

**FREE!****Comb  
Foundation****FREE!**

# Weed New-process Comb Foundation GIVEN AWAY!

A 2-lb. trial package included in every shipment of \$25 or over, simply for mentioning this advertisement.

Our factory is more complete than ever; and, having enlarged our business very much, buying every thing for cash, we are anxious to do twice the amount of business in the line of comb foundation that we ever did before. Our Weed New-process Comb Foundation is the best that money can buy; and whenever we succeed in placing some with a bee-keeper it means that bee-keeper's trade in the future. We also work wax into foundation by the pound at reasonable rates. Write us for rates, stating amount of wax you desire worked up.

With our very large and complete stock of The A. I. Root Co.'s make of bee-keepers' supplies in connection with our comb-foundation factory we are placed in position to offer you a special inducement to try our comb foundation, as we feel confident that you will use it all the time after you once try it.

## HERE IS OUR OFFER — GOOD ONLY UNTIL FEB. 1, 1908:

Any one who sends in an order for bee-supplies at the regular catalog price, with the cash to the amount of \$25 or more, will receive, **absolutely free of charge** with his shipment, 1 lb. of thin super foundation and 1 lb. of light brood foundation as samples. When sending in your order you must mention this advertisement in *GLEANINGS* to entitle you to the 2-lb. sample package of foundation.

Now, please understand your order must be for \$25 or more, and no shipment will be entitled to more than 2 lbs. of foundation—no matter how large the order may be. We are glad to give you a 2-lb. package to convince a bee-keeper that our foundation made by the Weed New Process, out of our clear southern beeswax, is good foundation. We are doing this to enlarge our trade. We seldom lose any of our customers, as we know how to give the money's worth. We receive many complimentary letters from our customers, such as the following, unsolicited:

*Udo & Max Toepperwein*:—I got the bill of hives, and nearly all are made up. They are the finest hives I nearly ever saw. While we were waiting for the order my wife said: "Where did you order your hives from?" I said they were from The A. I. Root Co.; then she said, "Then we shall get some good hives, for they make the best hives we ever used." She always nails up the hives and frames, so she has a right to know about as much about the hives as I do. We have bought bee-supplies from several different factories, but A. I. Root makes the best goods of any of the factories that we have ever bought from. I have used foundation from several different factories, and think your Weed New-process Comb Foundation as good as any I ever used. It is a great pleasure to deal with a firm that ships out the supplies as promptly as you do.

Taft, Texas, Dec. 22, 1907.

Yours very truly, S. M. CAMPBELL.

*Udo & Max Toepperwein*:—Are you still in the bee-supply business? If so, please send me one of your descriptive catalogs, as I want to buy all my supplies from you as long as you are in the bee-supply business.

Mineral, Texas, Dec. 23, 1907.

Very truly yours,  
J. W. WOLFE.

THE A. I. ROOT CO.  
MEDINA :: :: OHIO

Only two years have elapsed since we brought out an edition of 15,000 copies of the well-known A B C of Bee Culture. This brought up the number to 100,000 copies, thereby surpassing in popularity all other bee-books ever printed.

The demand for these has been so great that we were compelled to undertake a new edition at once, and in doing so we took the opportunity to revise and greatly enlarge it again, though it had been generally considered quite a large book.

In doing so we brought in new blood to assist us, give new ideas, and otherwise enable us to produce as good a book as it is possible to make at a popular price. If you will carefully examine a copy you will be prepared to admit the new volume is quite an improvement on its predecessors. To keep pace with improvements it contains nearly 100 double-column pages more than the previous edition.

The new methods of queen-rearing have been carefully reviewed, and the main points incorporated in the new edition, so that the practical bee-keeper who possesses a copy will have the best ideas of the subject constantly by his side for reference.

The new methods of wax-production are treated in an exhaustive fashion; and as this subject is now of more importance than formerly, more space has been devoted to it.

The new power-driven automatic extractors are amply illustrated and described. The subject of diseases has received entirely new treatment to keep pace with the new discoveries of the last few years. The laws relating to bees have for the first time received full treatment. No other bee-book treats of this very important subject. Honey, sugar, nectar, and glucose are carefully defined in accordance with the demands of our new pure-food laws.

In accordance with the ideas of its first author, A. I. Root, the new A B C and X Y Z is *eminently practical*.

German edition (new), paper covers, \$2 00; cloth-bound, \$2.50. Postpaid anywhere. This is the famous A B C in the language of the Fatherland, to suit our many German friends.

French edition (new), cloth-bound, \$2.00, postpaid. This is another edition, translated into the beautiful language of France.

## Classified Advertisements.

Notices will be inserted in these classified columns at 30 cents per line. Advertisements intended for this department should not exceed five lines, and you must say you want your advertisement in the classified columns or we will not be responsible for errors.

## Sheet-metal Stamping, Dies, etc.

We are prepared to do large or small jobs of sheet-metal stamping at reasonable rates. Contracts for monthly deliveries solicited. Special dies made to order. Write for prices, stating quantities, time of delivery required, and send samples or drawings of the articles and any other particulars.

THE A. I. ROOT CO., Medina, O.

SAMUEL M. ANGEL, Route 1, Evansville, Ind.

#### CATALOG FOR 1908.

We have begun mailing our 1908 catalog. If your copy does not reach you as soon as you would like it, send a request for one on a postal and we will mail it. Better wait a week before sending, as we wish to mail most to our list of readers, so you should get one now very soon.

#### SWEET-CLOVER SEED, WHITE AND YELLOW.

We are furnishing the unhulled white-sweet-clover seed at 15 cts. per lb.; by mail, 25 cts.; 10 lbs., not prepaid, \$1.30; 25 lbs., \$3.00; 100 lbs., \$11.00. For hulled white add 7 cts. per lb. Yellow-sweet-clover seed is now on the way from Oregon, and should be in stock soon. For hulled seed, while it lasts, 25 cts. per lb.; by mail, 35 cts.; 10 lbs., \$2.30; 25 lbs., \$5.50; 100 lbs., \$21.00. Pamphlet on the cultivation of sweet clover mailed free to those interested who call for it.

#### HOTBED SASH AND GLASS FOR THE SAME.

We have made an improvement in our hotbed sash by adding a round rod of hard wood through the center from side to side midway between the ends. Some bars are inclined to warp, making it more difficult to fit in the glass; also in lifting the sash by the side rail it may spring and loosen the glass. By the addition of the rod, with a nail driven through at each bar, after all are properly spaced, these objections are overcome. We are also making them standard width, 3 ft. 4 in. wide for four rows, 8-inch glass. We can also furnish them 3 ft. wide for three rows of 10-inch glass, or 3 ft. 6 in. for three rows of 12-inch glass on special order. As regularly furnished they are grooved for glass to be butted together, the joint to be closed with liquid putty. We also furnish them rabbeted so the glass may be lapped if so ordered.

Price of regular-size sash, 90 cts. ea h; \$4.25 for 5, or \$8.00 for 10, shipped in flat, not put together. If put together not painted, add 10 cts. each. If put together, painted two coats, add 30 cts. each; glazed with 8x10 glass, add \$1.00 for each sash at present price of glass. We can offer 8x10 glass at present for \$2.40 per box; 5 box s at \$2.30; 10 boxes or more at \$2.20. This is a very low price, due to a recent cut in price of glass, and is not guaranteed for any length of time. If in need of sash or glass, send in your orders while the present low price holds good.

## Convention Notices.

The annual convention of the Southeastern Minnesota and Western Wisconsin Bee-keepers' Association will be held at Winona, Minn., in the court-house, on Feb. 26 and 27. Those interested are invited.

OZRO S. HOLLAND, Sec.

#### NEW BEE-KEEPERS' SOCIETY ORGANIZED.

We have formed a new organization in Wheeling, W. Va. We call it the Panhandle Bee-keepers' Association. It is to include part of Ohio, West Virginia, and Pennsylvania. At the meeting we found that there is full brood in one apiary in Belmont Co., Ohio.

Blaine, O.

W. L. KINSEY, Sec.

The Wisconsin State Bee-keepers' convention will be held at the Capitol, Madison, Wis., Feb. 5 and 6. President N. E. France promises several good papers and an abundance of questions. The special features of the Wisconsin convention have always been the friendly and social intercourse among its members, and the profitable and instructive questions and answers of special interest to bee-keepers. Everybody is cordially invited to be with us.

GUS. DITTMER, Secretary.

The Indiana Bee-keepers' Association will meet at room 12, in the State-house, Feb. 1. We wish a full attendance of bee-keepers, whether they are members or not, as business of the utmost importance will be discussed. Foul brood is found now in a majority of counties in the State, and it is to stop its ravages that this movement is being made. We wish at least one representative from each county in the State to be present. There has been quiet an enrollment of members the last year, and we wish many more this winter. Come if you can; and if you can not come, send a dollar, and this will enroll you a member of the State organization and also the National. Do it now.

Kedkey, Ind.

GEO. W. WILLIAMS, Pres.

#### THE NEBRASKA STATE BEE-KEEPERS' ASSOCIATION.

This association will hold its next annual meeting in room 303, Agricultural Hall, at the State Farm, Lincoln, on Jan. 22 at 2 P. M. President, C. M. Lewelling, Beaver City; Secretary, Miss Lillian E. Trestler, Lincoln. The following is the program.

Address by the President.

Reading of the minutes of previous meeting.

Roll-call.

Wintering Bees, by I. D. Shuman, Callaway, Neb.

Discussion.

Bee-keeping as a Secondary Industry on the Farm, by J. E. Atkinson, Pawnee City.

Discussion.

Practical Hints for the Bee-keeper, by O. E. Carlson Vice-president, Newman Grove, Neb.

Question-box.

JAMESTOWN, N. Y.

I believe the Detroit Tongueless Disc Harrow has had the largest sale in its first two seasons on the market of any farm implement ever manufactured.  
W. W. Collier, Gen. Mgr.

# Why Not Accept My Offer and Try a Detroit Tongueless Disc Harrow Free for a Month?

## CAUTION:

Beware of imitations. They say "imitation is the sincerest flattery"—and our Detroit Tongueless Disc Harrow is being very much flattered. There are several cheap imitations of our Harrow being offered for sale through dealers. Don't buy one of them believing that you are getting a genuine Detroit—because you are not. The Detroit Tongueless Disc is not for sale by any dealer—anywhere. We sell it direct from our factory—and you keep all the dealers' profits in your own pocket.

**T**HAT'S my proposition—I mean every word of it. You can use one of these discs on your farm—for a full month without cost.

At the end of that time—if you don't want it—return it to us. We'll allow the freight—thus the test won't cost you one penny. That test is only a part of our liberal selling plan.

It's just our way of assuring every one of our customers that they are going to get what they want and what they will be pleased with when they buy a Detroit Tongueless Disc Harrow.

We're anxious to send a Detroit Tongueless Disc Harrow to any responsible farmer—without deposit—and without advance payment—to make the test. It must be a good Disc—and one that will PLEASE you—or we could not go on making this proposition year after year.

We're sending out thousands upon thousands of these Discs all over the country on this plan. Surely we could not afford to do this if the Disc were *not* all we claim it to be.

The principle of the Detroit Tongueless Disc Harrow is right. The Forward Truck does away with all of the annoyance on the team of the old "tongue." It does away with all jamming—end thrust—and whipping of the horses, that frets them and puts them out of commission just at the time you need them most. See the two wheels back of the Disc Blades in the picture?

Those wheels are a part of the Detroit Tongueless TRANSPORT TRUCK, upon which you can raise the Disc Blades off the ground, making them rest on the front and back Trucks—so that you can drive the Harrow over stony ground, rough and sandy roads, bridges, etc., without dulling the blades or cutting up the surface. A good invention—that Transport Truck,—most worth its weight in gold the way it saves Disc Blades that have to be transported from one field to another or from house to field.

Year before last we had over 1600 orders for this Disc that we couldn't fill—had to send them back. Last year we made twice as many as the previous year—and still we couldn't fill all our orders.

This year we've increased our factory facilities, and hope to be able to fill every single order on the Detroit Tongueless. It has had a wonderful sale—and has given universal satisfaction.

**WE SELL YOU A DETROIT TONGUELESS DISC HARROW—ON TIME—ON TRIAL—FREIGHT ALLOWED**

Anyway, we invite you to drop us a line on a postal card, giving us your name and address, and letting us send you our new 1907-08 Disc catalogue. This Book tells you more about the famous Detroit Tongueless Disc Harrow than we can tell you here—gives you our Selling Plan and quotes prices on a Detroit delivered at your railroad station. You can buy the genuine Detroit Tongueless Disc only through us direct. We advise you of this that you may not be imposed upon by some unscrupulous dealer who will represent to you that he has a Detroit Tongueless Disc Harrow for sale—or one as good. He *can't* have a genuine Detroit Tongueless—and he can't have one—just as good."

**W.W. Collier, Gen. Mgr. AMERICAN HARROW CO., 469 Hastings St., DETROIT, MICH.**

**NOTE: Full line of Detroit Tongueless Discs are carried at our branch houses in all leading trade centers, enabling us to make prompt shipment to all points. To be sure of getting a Detroit Tongueless just when you want it, better get your order in early.**

**Sold on Time**

# SHELTER FROM SUN OR STORM

There's a certain satisfaction in owning a "Shelertop" Buggy that no other buggy can supply. Why? When you start out for a drive, or on a long business trip, you know for a certainty that it's going to be pleasant. In hot weather the "Shelertop" protects you from the sun's sweltering rays. If a storm or a sudden squall comes up, simply close the buggy and ride dry and comfortable. No ifs or ands or maybes about it—you cannot forget to take along the side curtains, or the storm front, because they are a part of the "Shelertop"—out of sight when not in use—handy to get in position when needed.

## THE "SHELTERTOP" BUGGY

THE  
ONE BUGGY  
FOR ALL  
WEATHERS

Three simple one-hand movements—done in three seconds—without leaving seat, stopping the horse or dropping the lines, shuts the "Shelertop" up so tight a drop of water cannot get inside the buggy no matter how hard it rains or the wind blows. Changed instantly from a handsome, fair-weather buggy to a cosy shelter from wind, rain, dust and mud. The only real improvement in buggies since the days of the Deacon's Old One-Horse Shay. Constructed from the best materials money can buy, in a factory especially equipped with the latest machinery, by skilled buggy builders. Handsomely finished, and sold on **30 days' free trial** before you pay us a cent. We ship the buggy and allow you to try it—we want you to use it just as if it were yours—we want you to ride in it in all kinds of weather, and convince yourself that it is the buggy to buy. While

you are buying a buggy you might as well get the best. The protection you can get only in the "Shelertop" Buggy alone is worth every dollar the buggy costs. Write to-day for catalog describing the construction of all parts of the vehicle, and be sure to ask for our **free trial plan**. Don't buy a buggy until you get the catalog and this information. Address.

**FOUTS & HUNTER CARRIAGE MFG. CO.**  
333 S. Third St., Terre Haute Indiana.

# Gleanings in Bee Culture

*Apiary of one of Gleanings subscribers in the far North. J. Enelund, Kulla, Hjelstaby, Sweden.*

*Published by* The A. I. Root Co., Medina, Ohio, U. S. A.

Entered at the Postoffice, Medina, Ohio, as Second-class Matter.

# \$500.00 ACCIDENT INSURANCE POLICY FREE!

## FARMERS' INSURANCE THAT REALLY INSURES.

You may have had other chances to buy accident insurance that would protect you in elevators, on steamboats, and automobiles, but this is the *first chance you have ever had* to get real protection in your ordinary work. This NEW \$500.00 POLICY was secured from the North American Accident Insurance Company, of Chicago, Ill., (Surplus \$331,498.65) the largest company in America handling this class of policies, after long negotiations. It took three months to induce the company to write the special features that were required to make it valuable for rural people. By buying the policies outright in very large quantities, it is now possible to offer it FREE with this remarkable practical combination of magazine.

**GLEANINGS IN BEE CULTURE, \$1.00**  
the bee-keepers' favorite paper,

**FARM JOURNAL (five years), .75**  
the standard farm paper of the world,

**GARDEN MAGAZINE—FARMING, 1.00**  
a most beautiful, practical horticultural magazine.

**INSURANCE POLICY . . . 1.00**  
**\$3.75**

## All for \$2.

These magazines, if paid for separately, would cost you \$3.75, but we can sell ALL THREE MAGAZINES with the NEW INSURANCE POLICY for ONLY \$2.00. This is because the three publishers have combined for a subscription campaign. If each one sent you a separate letter it would cost us just three times as much as where we offer all three together. **THE SAVING GOES TO YOU.**

If the policy is not wanted we can substitute any of the following: "Designer," "Housekeeper," "Ladies' World," "McCall's Magazine," "Mother's Magazine," or the Garden and Farm Almanac.

## WHY SHOULD YOU HAVE THESE PAPERS?

**BECAUSE GLEANINGS IN BEE CULTURE** is the great paper in America devoted to bees and honey. If you have bees, or are going to get them (and everybody who lives in or near the country should have bees), you need the most reliable and latest information, and you want at the same time the simplest directions possible. You want the bee business in a nutshell, and that is what GLEANINGS will give you. For the beginner or the most expert it is equally valuable.

**BECAUSE FARM JOURNAL** is far and away the foremost farm-paper in the world, a boiled-down, practical, helpful, entertaining monthly, built to make the rural homes of America more happy, prosperous, and contented, and already doing it for more than 500,000 homes. For farmers, villagers, or suburbanites.

**BECAUSE** the most beautiful garden and horticultural publication in the world is the GARDEN MAGAZINE, full of sound sense, beautiful engravings from photographs, and fine printing. It has ten issues at 15 cents each and two at 25 cents each, per year, and the subscriber gets his money's worth twice over. It is a delightful magazine, useful, stimulating, and ornamental.

## WHY SHOULD YOU HAVE THIS INSURANCE?

Because you are in danger, every moment, of an accident which may cripple you for weeks, months, or for life; because the loss of an eye, a hand, or a foot, may mean destitution for yourself and your family; because this protection, for a full year costs you nothing whatever.

### WHAT THE POLICY PAYS:

|                                                                                                          |          |
|----------------------------------------------------------------------------------------------------------|----------|
| For Loss of Life.....                                                                                    | \$500.00 |
| For Loss of Both Eyes, meaning entire and permanent loss of the sight of both eyes.....                  | 500.00   |
| For Loss of Both Hands, by actual and complete severance at or above the wrist.....                      | 500.00   |
| For Loss of Both Feet, by actual and complete severance at or above the ankle.....                       | 500.00   |
| For Loss of One Hand and One Foot, by actual and complete severance at or above the wrist and ankle..... | 500.00   |
| For Loss of One Hand, by actual and complete severance at or above the wrist.....                        | 125.00   |
| For Loss of One Foot, by actual and complete severance at or above the ankle.....                        | 125.00   |
| For Loss of One Eye, meaning entire and permanent loss of the sight of one eye.....                      | 50.00    |

Provided such loss shall result within thirty days from date of accident, from accidental bodily injuries, solely and independently of all other causes, and covers accidents as follows:

Being thrown from a mower by horses.  
Being knocked down in the road by a wagon or automobile.  
Being hurt in a bicycle accident or collision.  
Being hurt while operating corn-sheller, fodder-cutter, etc.  
Being caught in a burning building, house, or barn.

Being hurt in an elevator or any public conveyance—train, trolley, boat, etc.  
Being injured in a runaway.  
Being frozen or frostbitten.  
Being injured by robbers or burglars.

Should the Assured obtain injuries in the manner specified above, which shall not prove fatal, but which shall immediately, continuously, and wholly disable and prevent the assured from performing each and every duty pertaining to any business or occupation, the Company will pay the Assured FIVE DOLLARS PER WEEK during the time of such disablement, but not exceeding six consecutive weeks for any one accident.

## NO DELAY OR EXAMINATION.

The insurance goes into effect as soon as you receive the policy and mail back the coupon attached to it. There are no dues, taxes, premiums, or assessments of any kind whatever to be paid by you. We have paid everything in full.

The three papers will begin at once, and will come to you each month till the time expires. **THEN THEY WILL STOP**, unless you order them renewed.

Send us \$2.00 by registered mail, or postoffice or express money-order to-day. Money refunded to any dissatisfied subscriber. Address

## Honey Markets.

### GRADING RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**A No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct, to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent) cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

**CINCINNATI.**—There is absolutely no demand for either extracted or comb honey at this writing. Lower prices would be no inducement to the buyers, and a waiting game must be played until the trade calls for this commodity. We offer amber extracted honey in barrels at from 6 to 7½; fancy table honey from 9 to 10, in 60-lb. cans. Fancy comb honey, 16 to 18. The above are our selling prices. We are paying 28 cts. per lb. cash and 30 in trade for good to choice yellow beeswax, free from dirt, delivered here.

THE FRED W. MUTH CO.,  
51 Walnut St., Cincinnati, O.

Jan. 13.

**SAN FRANCISCO.**—Honey so far shows no further change, jobbing prices being the same, and no concessions are offered by local dealers, though stocks are larger and prices to growers are weak. We now quote: Water-white, comb, 16 to 17; white, 15; water-white, extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 6½ to 6¾.—*Pacific Rural Press.*

**INDIANAPOLIS.**—Demand for best grades of extracted honey is good, while the demand for comb honey is not so brisk. Very little honey is being offered by producers at present. Jobbers are offering the following prices, delivered here. No. 1 and fancy comb, 16 to 17, net weight; extracted white clover, 9 to 10. Beeswax, 28 cash or 30 in exchange for merchandise.

Jan. 20. WALTER S. POWDER, Indianapolis, Ind.

**ST. LOUIS.**—The honey market has not undergone any change since ours of the 10th. Trade is exceedingly slow at the following prices: Fancy white comb, 15 to 16; No. 1, 14 to 15; amber, 13 to 14. Broken and defective honey sells at considerably less. Extracted white, in cans, nominal at 8 to 8½; amber, in cans, 7½ to 8; in barrels and half-barrels, ½ to 1 ct. per lb. less. Granulated honey sells at about ¼ ct. less than liquid. Beeswax, 26½ for choice pure. All impure and inferior, lower.

R. HARTMANN PRODUCE CO.,  
Jan. 20. St. Louis, Mo.

**KANSAS CITY.**—The demand for comb honey is a little better, but there is not much improvement in extracted. We quote: Fancy white comb, 24-section, \$3.25 per case; No. 1 white comb, 24-section, \$3.00 to \$3.10; No. 2 white and amber, 24-section, \$2.75; extracted white, 8 to 8½; extracted dark, 7. Beeswax, 25 cts.

C. C. CLEMONS & CO.,  
Kansas City, Mo.

**CHICAGO.**—There have been some heavy consignments of Western honey to this market, both extracted and comb. It must be held by the receivers for some time, as it can not be placed at any thing near prevailing prices. One trouble with which we contend is the limited consumption.

R. A. BURNETT & CO.,  
Chicago, Ill.

Jan. 21.

**ZANESVILLE.**—This market is still well stocked with honey, especially alfalfa. An occasional shipment of clover comb comes in from eastern and north-central States. The demand for honey, both comb and extracted, is still light, though it has toned up slightly since last report. No. 1 to fancy white comb would bring, first-hand, 15 to 16 cts., wholesaling at about 17½ to 18. Extracted, in 60-lb. cans, is quoted at 11 to 12½, wholesale. Beeswax quiet. Would pay 30 cts. in exchange for bee-supplies f. o. b. here.

EDMUND W. PEIRCE,  
136 W. Main St., Zanesville, O.

Jan. 21.

**BUFFALO.**—The demand is improving a little for white comb honey. Not very much in dealers' hands here. Extra good demand for white extracted, quick sale on arrival. No. 1 fancy white clover comb, 16 to 17; No. 2, 13 to 15; No. 1 buckwheat, 11 to 12½; No. 2, 10 to 11. White clover extracted, 9 to 11; amber, 8 to 8½; dark, 7 to 8. Beeswax, 30 to 32.

W. C. TOWNSEND,  
Buffalo, N. Y.

Jan. 12.

**DENVER.**—We quote: No. 1 white comb honey passes off, 24 sections, \$3.25; No. 1 light amber, \$3.00 to \$3.10; No. 2, \$2.75 to \$2.90; strictly No. 1 white extracted, 9 to 10; light amber, extracted, 8 to 9; strained, 6¾ to 7¾. We pay 24 cts. for clean yellow beeswax delivered here. COLORADO HONEY-PRODUCERS' ASSO'N.

Jan. 23. F. RAUCHFUSS, Mgr.

**ST. PAUL.**—Fancy white-clover honey, new, per lb., 18; strained, in 60-lb. cans, 10.

W. H. PATTON, Sec.

**KANSAS CITY.**—Western comb, No. 1, per case, \$3.75; No. 2, per case, \$3.50.—*Cincinnati Packer*, Jan. 25, 1908.

Guaranteed to save 50 per cent in fuel, labor, time, and provisions. A whole meal cooked over one burner on any style stove. It assures you deliciously cooked hot meals; 30 days' trial. No intermingling of odors or tastes. Fine for use in summer cottages. A necessity every day of the year. The only healthful way to cook foods and breadstuffs.

*Handsomely illustrated catalog free.*

"O-HI-O" COOKER CO.  
908 Jefferson Av., Toledo, O.

# Subjects for Discussion!

The cornerstone of successful publishing lies in finding out what readers want, and then giving it to them. With this end in view I asked my subscribers, last September, to tell me what subjects they would like discussed. The list is decidedly interesting and practical. Here are some of the topics:

Which is the best comb-honey super, and why?

How can we make rapid increase the most profitably?

What is the cause and cure for pollen being stored in the sections?

How much can be learned of the conditions of a colony from outside indications?

Give the comparative advantages and disadvantages of shipping comb honey by freight or by express.

What is the best management for the production of honey with only white clover as a source of nectar?

How deep from glass to floor ought a solar wax-extractor to be made to secure the best results?

Is it practical to winter bees successfully in a building wholly above ground?

Is it possible for some bee-keepers to improve profitably the honey-producing capacities of their localities?

Shall we buy bees, or build up a smaller number of colonies, when bees are wanted to start an out-apiary?

Give the comparative advantages and disadvantages of comb and extracted honey production. Would like to hear from R. L. Taylor.

These topics are printed here for two reasons: One to show what topics will be discussed in the Review in the near future, and the other to ask you to send in articles on any of these subjects. Any article that I think well enough of to publish I'll pay for—liberally.

The Review is \$1.00 a year; but just at present I can send all of the back numbers of 1907 free of charge to the man who sends \$1.00 for 1908. In other words, you can get 1907 and 1908 for only \$1.00. Add another dollar and the book *Advanced Bee Culture* will also be sent. Book alone, \$1.20.

**W. Z. HUTCHINSON, :: :: :: FLINT, MICH.**

The following extract from a recent letter received from one of our advertisers, to whom we had written for certain information regarding their financial standing and their ability to take good care of orders that might be placed with them by our subscribers, speaks for itself:

COLTON CAL., Jan. 13.

Your carefulness in accepting advertising should certainly be appreciated by your subscribers, and this inquiry as to our responsibility has given us a great deal more confidence in the idea that your publication will be a good one for us.

[Signed]

CALIFORNIA PRODUCTS CO.

In this connection we desire to call the attention of our readers, particularly those throughout the East, to the advertisement of this concern, which is found on page 175.

OLDS' SEED CATALOG.

We are in receipt of an excellent catalog from the reliable seed-distributors, the L. O. Olds Seed Co., of Clinton, Wis. This, evidently, is a farmer's catalog, for it pays great attention to farm seeds such as corn, oats, potatoes, clovers, barley, spelt, alfalfa, millet, melons, cabbage, squash, tomato, and other familiar farm seeds. We suspect the seeds recommended by the Olds Co. are just about right for the central and northwestern States, and we know them to be a reliable concern. Of course, they

Give the needed size of a bee-cellar in proportion to the number of colonies it is to contain.

What is the best method of getting honey out of cappings—by draining or by pressure or how?

What is the best and most simple way for the ordinary bee-keeper to rear any extra queens that may be needed?

Give the comparative advantages and disadvantages of queen-excluders in the production of extracted honey in out-yards.

Those who have had experience in wintering and springing bees protected by tarred felt are asked to report—giving their experience and views.

How can we requeen an apiary to the best advantage when producing either comb or extracted honey, and not lessen the working force nor lose any surplus?

Can the "feeding back" of extracted honey to secure the completion of unfinished sections, or to produce comb honey, be made profitable? If so, how?

How can we improve our bees by breeding? How shall we select the foundation stock? Will stock deteriorate, or "run out," if left to itself? Shall we breed "in and in," depending upon selection for improvement, or is it desirable to introduce new blood occasionally? and, if so, how often? Is any thing gained by crossing varieties? Is there any truth in the statement that bees lose their vigor in the South?

list such flower-seeds as may be necessary for the proper adornment of the rural home. We believe that any one buying from them will receive fair treatment. A postal will secure their catalog by return mail. When you send for it, please mention this journal.

HUMPHREY'S GREEN-BONE CUTTER.

One of the greatest conveniences on a poultry-farm is a good green-bone cutter—one that can be depended on to do the work when required, without extraordinary physical effort. As will be observed by his advertisement on another page, Humphrey, of Joliet, Ill., claims to have just such a machine, and we know he is a reliable man. There is no longer any doubt about the great value of these bone-cutters to the poultryman, more especially the breeder who is conducting an egg campaign. Green cut bone not only produces more eggs, but it is a necessity to fowls which are confined, when it is impossible for them to secure worms and bugs, such as they delight in, and which are necessary to their existence.

Another point that should not be lost sight of is the practical economy of green cut bone, since all it costs is the labor, in most parts of the country at least. The proper use of it will turn a poultry failure into a success. If you require a green-bone cutter, please write Mr. Humphrey, Mine St., Joliet, Ill., for catalog and particulars of his introductory offer.

### KELLOGG'S STRAWBERRY CATALOG.

This is certainly a model catalog, gotten out by a model firm. It is something more than a mere catalog, for it contains a first-class treatise on strawberry culture, such as one would naturally expect to pay 25 cents for. In fact, it looks more like a work on the culture of strawberries than a catalog. The berry business is particularly well suited to the temperament of the average bee-keeper, and no finer occupation can be found. A glance at this fine book will show this to be the case. It is handsomely gotten up, well printed and illustrated on good paper, and, all together, reflects credit on the business and enterprise of the firm getting it out. We believe any painstaking intelligent man could actually learn strawberry-growing from this so-called catalog, and we mean what we say. It is almost needless to add that the firm sending out such a book is reliable, prompt, and satisfactory in all its business relations. Write at once to R. M. Kellogg, Three Rivers, Mich., for a copy. Then take your time to make a selection of berry-plants. Study its wisdom on berry culture, and you will not regret it.

### BURPEE'S, THE GREAT SEED FIRM.

We are again indebted to this firm for a copy of their well-known publication, "Burpee's Farm Annual," and, if possible, the present copy is an improvement on its predecessors. It has six beautiful colored plates of specialties with a handsome lithographed cover. In addition it shows sixteen new varieties of vegetables and flowers in their natural colors. It is needless to say that a firm which can turn out such a catalog has enterprise, genius, and financial resources back of it, and, of course, is sure to meet with success in its chosen field.

The Burpee people are responsible for some vegetables and flowers whose names are now household words, in this country at least. For example the well-known Rocky Ford melon is simply Burpee's Netted Gem; and in sweet peas they have had the field to themselves for some years. They have also taken a great deal of interest in developing special varieties of vegetables suitable to the market-gardener, and have been remarkably successful along this line. Catalog is free if you mention Gleanings.

FREE TO OUR READERS—CYPHERS INCUBATOR COMPANY'S COMPLETE 208-PAGE CATALOG FOR 1908.

Herewith is shown a fac-simile illustration of the Great Free Book of Cyphers Incubator Co., Buffalo, N. Y., which will be mailed free to our readers on

request, provided you mention this journal. The new catalog shown in the picture consists of 208 pages, 7 1/2 by 10 in size. It fully illustrates and describes the 72 valuable articles manufactured by

this well-known firm for the use of all classes of poultry-keepers. It also contains photographic views of many of the world's largest poultry-plants, of America's leading egg-farms, and portraits of the most successful poultrymen of the United States and Canada. Write to-day for a free copy of this valuable publication, addressing the nearest office of Cyphers Incubator Co., as follows: Factory and home office, Buffalo, N. Y.; Branch houses, 21 and 23 Barclay St., New York; 310 Fifth Ave., Chicago, Ill.; 26-30 Union St., Boston, Mass.; 2325 Broadway, Kansas City, Mo.; 1569 Broadway, Oakland, Cal.; 119 Finsbury Pavement, London, England.

### ALLEN'S STRAWBERRY CATALOG.

We have received our copy of W. F. Allen's catalog of strawberry-plants. He now lists other plants and seeds besides. Mr. Allen is a king among strawberry-growers and at one time published a strawberry paper. His place on the Eastern Shore of Maryland is the center of a great strawberry-growing section where the berries are shipped to New York, Philadelphia, and Boston by the train-load. Mr. Allen ships plants by the carload (express), sending them to all parts of the United States and even to foreign countries.

Almost all berry-growers also grow vegetables as well, and Allen's catalog now contains a fair list of the leading sorts used by market-gardeners. One of the specialties of the Eastern Shore is its sweet potatoes the soil and climate being just to the liking of this great crop. Another crop which grows with great success down there is crimson (or scarlet) clover. It is very extensively planted in Maryland and Delaware, and flourishes with great luxuriance. It is listed here with other farm seeds. This certainly is a catalog well worth sending for. Write to W. F. Allen, Salisbury, Md., and please mention this journal when doing so.

## FROM MAINE TO MEXICO.

Strange it is that some people have an idea that the wants of the readers of a bee-journal are limited to such things as bee-keepers' supplies, queens, etc., forgetting that the average bee-keeper's family requires a varied line of goods the same as the rest of humanity.

In February last we received an order for a single insertion of a five-line advertisement of seed corn, which cost the advertiser \$1.00. On July 10 he wrote us:

**CALVIN S. HUNTER,  
CROWER  
BEST "WHITE SEED CORN."  
SINCE 1865.**

**SEVEN MILE, O.** July 10, 1907.

The A. I. Root Co.,

Medina, O.

Gentlemen:--

The fruit of my advertisement with your high-class journal reached from Maine to Mexico. I send you a sample order and international money-order in Spanish, which I am sure Mr. Root, Sr., will be glad to see. Tell him I sent this man the finest corn in the kingdom, for I was not looking for an order "from the uttermost parts of the earth."

Very truly yours,

Calvin S. Hunter.

This man is only a chance advertiser in GLEANINGS in our classified columns, and yet he has to report such results as above. He is one of the readers of GLEANINGS lately referred to as being one of the substantial buying class, and is only incidentally an advertiser with us. In looking over his correspondence, we find the following statement from him:

**SEVEN MILE, O.,** July 10, 1907.

The A. I. Root Co.,

Medina, O.

Gentlemen:--

I have a great respect for GLEANINGS, and, on our table, containing twenty to thirty of the leading journals and papers, it is the gem of the lot.

Yours very truly,

Calvin S. Hunter.

When GLEANINGS stands so high in the estimation of its readers, it isn't to be wondered at that 35,000 of them would constitute a strong buying class.

For many lines which haven't been widely advertised with us as yet, it offers a very fertile field, probably many times better than the overworked columns of the agricultural papers. Particular information regarding the class of people we reach, or any thing relating to the subject, may be secured by addressing

**ADVERTISING DEPT. GLEANINGS IN BEE CULTURE, MEDINA, O.**

# The Danzenbaker Comb-honey Hive

**M**ICHIGAN is one of the leading States for the production of fancy comb honey, and we particularly urge those of our customers interested in this to try the Danzenbaker hive. Read what Mr. Wortman says below:

## MORE HONEY.

I have a small apiary in Danzenbaker hives. I have taken more honey from them than four of my neighbors with other styles of hives. I have sold a good many Danzenbaker hives, and every one is wanting more for the coming season. (Signed) HERMAN F. WORTMAN.  
Gilmore, Mo., Dec. 1907.

## BETTER HONEY.

"I have an apiary of about fifty colonies, from which I secured from sixty to one hundred and forty pounds of the *finest* comb honey per colony you ever saw. I use the Danzenbaker super and consider it the best. I love bee-keeping, and believe there is no other business so interesting as keeping a few colonies of bees. (Signed) FRED W. RANKIN.

Cranesville, N. Y., Dec. 26, 1907.

## BETTER PRICES.

It is a recognized fact among the users of this hive that the honey produced is much finer in appearance, as stated by Mr. Rankin, and, this being the case, it follows that better prices are secured. This is by reason of a much larger percentage being of a fancy and extra fancy grades which command the highest prices. These grades are never a drug on the market; indeed, many discriminating buyers often make special inquiry for honey in Danzenbaker sections.

REDFORD, (NEAR DETROIT) MICH.

## TO THE BEE - KEEPERS OF CANADA.

**W**E are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the **QUALITY**. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, The best is cheapest."

**E. GRAINGER & COMPANY,**  
Deer Park,  
Toronto, Ontario, Canada.

## THE DANZENBAKER SMOKER

PAT. OCT. 3, '08, JUNE 4, '07

### GOLD MEDALS

St. Louis Exposition, 1904  
Jamestown Exposition, 1907

IS THE BEST,  
STRONGEST,  
COOLEST,  
CLEANEST,  
CHEAPEST,  
AND LARGEST  
SMOKER SOLD  
FOR A DOLLAR

The perforated side grate seen above holds a removable, metal, asbestos-backed fire shell, preventing burning the tin off the outer case, and deflects the air at right angles, preventing back draft to the valveless bellows. The air, passing to the back and over the top, cools and expels the smoke, fanning the burning fuel at top or side till all consumed, giving cool smoke for hours from one filling. It can't clog. No top-heavy cap to choke with soot; no valve to fail; no holes shedding sparks or hot ashes.

Four years' sales prove its success beyond a doubt, expensive dies making it uniformly perfect as possible to devise. We confidently guarantee full satisfaction or refund the price.

Price, \$1.00; 3 for \$2.50; by mail, add 25c. each

Send address of yourself and Bee friends for 8-page leaflet on "Smoker," and facts about Bees and Queens, 80 pages, free.

THE A. I. ROOT CO.  
MEDINA :: :: OHIO

Only two years have elapsed since we brought out an edition of 15,000 copies of the well-known A B C of Bee Culture. This brought up the number to 100,000 copies, thereby surpassing in popularity all other bee-books ever printed.

The demand for these has been so great that we were compelled to undertake a new edition at once, and in doing so we took the opportunity to revise and greatly enlarge it again, though it had been generally considered quite a large book.

In doing so we brought in new blood to assist us, give new ideas, and otherwise enable us to produce as good a book as it is possible to make at a popular price. If you will carefully examine a copy you will be prepared to admit the new volume is quite an improvement on its predecessors. To keep pace with improvements it contains nearly 100 double-column pages more than the previous edition.

The new methods of queen-rearing have been carefully reviewed, and the main points incorporated in the new edition, so that the practical bee-keeper who possesses a copy will have the best ideas of the subject constantly by his side for reference.

The new methods of wax-production are treated in an exhaustive fashion; and as this subject is now of more importance than formerly, more space has been devoted to it.

The new power-driven automatic extractors are amply illustrated and described. The subject of diseases has received entirely new treatment to keep pace with the new discoveries of the last few years. The laws relating to bees have for the first time received full treatment. No other bee-book treats of this very important subject. Honey, sugar, nectar, and glucose are carefully defined in accordance with the demands of our new pure-food laws.

In accordance with the ideas of its first author, A. I. Root, the new A B C and X Y Z is *eminently practical*.

German edition (new), paper covers, \$2.00; cloth-bound, \$2.50. Postpaid anywhere. This is the famous A B C in the language of the Fatherland, to suit our many German friends.

French edition (new), cloth-bound, \$2.00, postpaid. This is another edition, translated into the beautiful language of France.

**"If goods are wanted quick, send to Pouder."  
Established 1889.**

## A Humming Business

*By the Bee Crank.*

Panics and near-panics have no terrors for the bee-man. His business is always a humming one. His tireless workers know little of hard times and care less for them. They are always busy during their season.

And their season is not faraway. Now is the time to get ready for it. My warerooms are full of fresh new goods, and orders will receive as always, the kind of attention you want them to receive.

I handle Root's goods at Root's prices. Can make immediate shipment of metal-spaced Hoffman Frames, Danzenbaker Hives, Dovetailed Hives, Section Honey-boxes, Weed-process Comb Foundation, Bee-veils, Smokers, and every thing used by bee-keepers.

**HONEY.** Particular people are sending here for finest white-clover honey. If interested, write for quotations.

Chicago, Ill., Jan. 16, 1908.

*Walter S. Pouder:*—Kindly ship another 120-pound lot of your superior white-clover honey. This honey is so delicious that a mere taste makes one hungry for more, and I have a number of small orders awaiting. I am proud of your honey, and would offer it to President Roosevelt with the same feeling that I offer it to my neighbors.

Thanking you for favors,

HARRY LEBNER.

**Beeswax Wanted.** I pay the highest market price for beeswax. Ship by freight or express according to amount. New catalog free.

## Walter S. Pouder,

# GLEANINGS IN BEE CULTURE

Published by The A. I. Root Company, Medina, Ohio

E. R. ROOT, EDITOR  
H. H. ROOT, ASST. ED.

A. L. BOYDEN, ADVERTISING MGR.  
J. T. CALVERT, BUSINESS MGR.  
A. I. ROOT, EDITOR OF HOME DEPARTMENT

Vol. XXXVI.

FEBRUARY 1, 1908.

No. 3

SOME SAY honey is a luxury, some say it is a necessity; but I rather like M. V. Facey's idea that it's both. He says, p. 86, "It is a luxury, but where constantly supplied it is a necessity."

RIGHT YOU ARE, Louis Scholl, in thinking producers should have more to say about prices of honey, p. 87. But let me whisper in your ear that, even in the North, some of us set our own prices.

LATELY I saw a queen-excluder advertised, I think it was in a German catalog, about the same as the Marbach, only it was of wood. One would think it wouldn't last long, but it might take the bees some time to gnaw the round wood at the right places.

J. L. BYER, after reading what you say, p. 98, I have a word of advice for you. Please remember that I am older and more experienced than you. My advice to you as to the matter of feeding in the fall is to keep right on the way you have been doing.

OF MANY A MAN it is true that he preaches better than he practices. I am glad to say that the reverse is true of my good friend G. M. Doolittle. Notwithstanding his shaky preaching about bees holding the heat in the cluster, his practice, as given p. 83, is sound as a dollar. Shake, Gilbert.

I DON'T KNOW what Louis Scholl means, p. 87, by saying a nail to hold a hive-tag "would soon be driven into the wall of the hive-bodies when these are handled," for in all the years I have used them I have never known one to be thus driven in. I must say, however, that I like the looks of his arrangement.

THAT PLAN of stretching the cord down tight and fastening with a safety-pin, as

shown at Fig. 5, is especially to be commended to ladies. Indeed, it is the invention of a woman not a thousand miles from Marengo. [Yes, it is true that Miss Wilson suggested to us the use of the safety-pin in a bee-veil as described in our last issue.—ED.]

DOOLITTLE SAYS that, in his locality, a colony which has stored comb honey is rarely short of stores for wintering and springing. Likely that is true of any locality *if* hives are large enough, and I suspect he is talking about ten-frame hives; at any rate, with eight-frame hives last spring I should have suffered heavily had I not had an extra lot of honey combs of honey.

I READ GLEANINGS, Jan. 15, as far as p. 80, and then I stopped and wrote three letters. To Dr. Wiley I wrote, "Heartily thanks for insisting that glucose shall be called glucose." To President Roosevelt and to Secretary Wilson I wrote, "If glucose is glucose, please don't let it be labeled any thing but 'glucose.'" [Good! If others have not already written, let them do so at once.—ED.]

AS FOOTNOTE to that veil article, p. 93, it might be said that, where one works much with bees, it is well to use a permanent bee-hat with veil sewed to the edge of the brim instead of having a rubber band hugging the crown. Where a rubber cord is used at the lower edge of the veil it is better to have a hem of white material to avoid crocking the clothing. [Yes, and the veiling could be sewn half an inch or one inch from the edge of the hat-brim. The purpose of this is to keep the sun from striking the veiling at such an angle as to interfere with the sight.—ED.]

THE LONGER the honey remains in the hive, the less sucrose (cane sugar) will be found, page 81. Please explain. [If we are correct, the process of inversion continues after the honey has been sealed in the combs. The older it becomes, the less there will be of sucrose or cane sugar. Apparently the process of inversion, after the bees get through with it, is not entirely complete; therefore the United States standard allows us a small per cent of sucrose in normal honey. But that does not mean that some one else may put in cane sugar; for the cane sugar of com-

merce is different from the cane sugar or sucrose found naturally in honey. The modern honey-analyst, at all events, is able to detect any foreign ingredient put into honey, even cane sugar.—ED.]

"SOME RESIDENTS of the buckwheat country consider buckwheat honey the best honey sold, and . . . there is every thing in getting our tastes educated to a certain flavor," p. 78. I think the prevailing honey is the one generally preferred in each locality; but I feel quite sure that there is a decided difference in taste aside from locality or education. In this locality, where buckwheat honey is rare, a few people strongly prefer it to white clover. A member of my family prefers a certain fall flavor to white clover, while the very smell of it is offensive to me.

I WONDER if something unusual in transit or otherwise had not happened to that sample of heather honey received in Medina, p. 78. I think I never sampled heather honey except once, and I surely did not call it *vile*. It was from Scotland, and may have differed from your English heather. [We do not know how to explain it; but we presume the sample sent to us was fine to those who were consumers of that kind of honey. For example, we consider Colorado alfalfa or California sage as very fine honey; but there are some who do not like either—especially those who like strong-flavored dark honey.—ED.]

"I TOLD YOU SO. I wanted you to put that in, and you wouldn't do it." That's what my assistant said to me upon reading what Mr. E. F. Atwater says, p. 82, about the behavior of a single piece of foundation fastened top and bottom. But I couldn't say it with the same authority as Mr. Atwater, not having had his experience; yet the fact remains that it was just because I wanted to avoid the unpleasant behavior of the single piece fastened at the bottom that I invented the bottom starter. That fastens the section at the bottom just as securely as the single piece fastened top and bottom, *but does not give the same opportunity for sagging*. Bottom starters require no extra machinery, and any one can try them.

E. H. BRADLEY must live in "the land of contraries," p. 91. When a colony swarms he keeps the strength as much as possible with the mother colony, and depends on it for surplus; elsewhere the swarm is thus used. In his locality the bees of a swarm seem to return to the parent stock, only "enough will remain to take care of all the eggs the old queen can lay;" elsewhere no bees of the swarm return to the parent. Unless he takes precautions the swarm may swarm again, making a virgin swarm; elsewhere no precautions are considered necessary to prevent a virgin swarm. With him it is no trick to produce prize honey over the black combs of the mother colony; elsewhere, if there is any difference, finer sections can be produced over a swarm with new combs.

REFERRING to p. 78, I think the Miller escape has the advantage that it is cheaper of construction, and takes less time in using,

while the bees may more readily desert the Whitney. But if I preferred the Whitney I would go back to the kind I used before the present Miller; mosquito-netting on all sides, instead of the Whitney box, and a cone at the top. The cone may be of wire cloth, or netting held up by two bent wires. That's away ahead of the Whitney or Miller for letting in light on all sides; but I prefer the Miller on account of convenience in using. Would not one large cone be better than the several small cones in the Whitney? [We do not know whether a lot of cones is better than one or not. An actual test will determine the point.—ED.]

ALL THAT, however, is aside from the main point. My request was that you tell us on what ground you base the objection that "very young bees are unable to get back to the hive." You do not reply to that, merely repeating, "It would be my opinion that some young bees will be lost." Please tell us *why* that would be your opinion. [If your pile of supers with your bee-escape is placed at some point remote from the hive or hives, then we do not see how it is possible for the young bees to go back to the hive whence they came. If the pile is placed near the entrance of some colony, then it is conceivable that they might crawl into such colony.—ED.]

THANKS to Louis Scholl for helping to keep the word "section" from being overworked, p. 88. I can hardly see the objection to "brood-chamber" that he does. Still less do I see the objection to the word "story." To be sure, story means a "full-depth hive-body." Well, what of it? Is there any fixed depth for a full-depth hive-body? A Jumbo hive-body is full-depth, so is any hive-body in use, so long as only one story is used, isn't it? Now, suppose two Jumbo bodies are used—one on top of the other—is not each body a story? Suppose two bodies ten inches deep are used; is not each a story? Go on down shallower and shallower, and where will you draw the line and say any thing shallower than this is not a story? and *why* is it not a story? Let me start from another quarter. If a man uses a single Heddon hive-body you would call that a story. Now, why isn't it just as much a story when he puts another story on it? [When we write about "divisible hives" or a "shallow hive" or a "sectional brood-chamber," is it not commonly understood that such hive or brood-chamber is about half the depth of an ordinary Langstroth hive? Langstroth depth is standard in this country. When we speak about a shallow brood-chamber it is understood that we mean about half the depth of the standard. When we say "Jumbo" we mean something deeper than the standard. When we talk of a short man we mean one considerably less than six feet tall. When we speak of a tall man we mean one who is nearly six feet or something above it.

We see no objection to the phrase "divisible" hive or "sectional" hive. The latter,

certainly, can not mean a hive full of comb-honey sections, unless one is woefully ignorant of apicultural terms.—Ed.]

#### LIVE-BEE HANDLING AT THEATERS.

EVIDENTLY some one else is doing stunts in handling live bees before an audience. The following advertisement appears in a Philadelphia daily, and reads as follows:

##### NINTH AND ARCH DIME MUSEUM.

Always ahead! First Philadelphia appearance of Barrett the bee-king and his countless thousands of bees. Unique stunts by curious winged artists. The most novel exhibition ever presented. Instructing, interesting, entertaining. What do you know about bees?

This dime museum will exhibit all over the United States, we are told. Perhaps some of our bee-keeping friends will be glad to see this.

#### DETROIT SECURES THE NATIONAL CONVENTION.

THE following, received from Secretary Hutchinson, will explain:

By a unanimous vote the executive committee of the National Bee-keepers' Association has decided to hold the next annual convention in Detroit, Michigan. The exact date has not been decided on, but it will be after the hot dusty busy season is past, but before the cold of winter has come—in those glorious days that come only in the autumn. The National has met in Detroit only once, nearly a quarter of a century ago; but that meeting was well attended—practical, enthusiastic, and harmonious.

The majority of bee-keeping specialists—those who attend conventions—live in the northeastern part of the United States and Canada, and Detroit is very nearly the geographical center of that district. It is easily reached from the middle South, from the East, from the middle West, and from Ontario; hence a great crowd of practical men can be gathered at that point.

W. Z. HUTCHINSON, Sec. N. B. K. A.

#### LABELING THE WEIGHT.

BEE-KEEPERS in Nebraska will have to take notice in future of the State pure-food law which compels vendors to state on the outside of a package the weight of the goods inside. According to a ruling of Deputy-Attorney-General Rose, this feature of the law is sound and constitutional, and must be enforced.

It looks as though comb honey would have to bear a label certifying to the weight. For the benefit of readers who have to do with this law we append the opinion of Mr. Rose.

In my opinion your interpretation that the contents, weight, or measure must be correctly stated on the outside of food packages sold in Nebraska is in harmony with both the spirit and the letter of the pure-food law. It is no answer to this construction to cite the national pure-food act. The Nebraska statute requires the contents, weight, or measure to be branded on the outside of packages of food, if sold for use in this State, while the act of Congress contains no such requirement. In this respect the federal statute did

not meet the approval of our legislature and can not be invoked to determine its meaning.

Every label or stamp will probably have to have a blank space in which the exact weight can be shown, in pencil or pen. W. K. M.

#### SUCCESS INSTEAD OF FAILURE.

AT the convention of the Michigan Bee-keepers' Association Mr. W. J. Manley, Sandusky, Mich., gave a most entertaining talk on "winter losses," in which he made the remarkable statement that he saved only one swarm out of 125 last spring, and made 400 per cent on his investment. He remarked that a winter loss with him is almost as good as a honey-flow. He explained the same by saying that his is an excellent locality for honey, but winter losses are heavy on account of the aster honey that the bees deposit late in the season, and on which they would not winter well. In the spring he melts up his old combs, sells the wax, buys bees by the carload, and turns apparent failure into success. He also explained his method of rendering wax on a large scale.

In a locality where the fall honey does not give good results as a winter food, we would advise the substitution of sugar syrup, properly made. It would at least save such great losses during the cold weather.

#### A WORD TO THOSE WHO EXPECT TO QUIT KEEPING BEES BECAUSE OF POOR SEASONS.

LAST week we had a visit from Mr. F. A. Salisbury, of Syracuse, N. Y. While here he told how one bee-keeper came to his place and said he guessed he would quit the business, as the seasons were getting to be too poor. Said Mr. Salisbury:

"Mr. Jones, you say you are going out of the bee business. Will you tell me if there is any other rural pursuit that, for the *money and time invested*, will begin to give the returns that one can get from bees when intelligently handled? Now just stop and think. A colony of bees will earn more clean money than the same money invested in general farming."

Jones thought a minute, then a smile began to play over his face, and he said:

"I guess you are right, old man—I guess you are right. But I thought that, because I had not done as well as *I used to do*, it did not pay me to keep bees."

"But really," said Mr. Salisbury, "have they not earned for you more than any thing else on the farm?"

"I guess that is so," said Mr. Jones.

In counting up the profits and losses in keeping bees, \$100 worth of syrup given to 100 colonies looms up *awful big*; but an average of only 10 lbs. of honey will cover this up. An average of 25 lbs. will leave a comfortable margin of \$100 of clean money. An average of 50 lbs. ought to give an earning capacity of \$4.00 per colony after expenses have been paid. Now, \$100 in the apiary does not begin to take the amount of time that the same investment does in general farming operations.

Suppose one has had two poor seasons with no surplus, as was the case with very many last season; has it not happened over and over again that one good year will more than make up for the two poor ones? Do not give up the bees yet; or at least before you do, figure up what you have got from them, and then consider whether it pays to "let 'em go galager."

Just recently we learned of a college student who, with a few bees, is paying his way through college. During the summer he works the bees for all there is in them; then during the fall and winter when they require very little attention, he, with the money earned, is getting a college education. This is not an isolated case, by any means.

#### THE APPALACHIAN FOREST RESERVE.

AN effort will be made at the present session of Congress to secure legislation which will give the Department of Agriculture the necessary powers to acquire a vast tract of country around the tops of the mountains in the Appalachian chain. The object of the government is very largely to save the forests which now grow on the slopes, but which are in danger of being totally destroyed by the lumber butchers.

The government would also conserve and control the water, either for supplying cities or for power, and at the same time save the mineral resources for the benefit of the whole people.

The Appalachian is a beautiful mountain country, a sort of playground similar to the Adirondack region of New York. In a few years the whole reserve would become a perfect summer resort if properly cared for, as it would be.

It is a hard-wood region, many of the trees (such as sourwood) being prominent beekeepers' trees. Much of the underbrush is composed of sheep-laurels and rhododendrons, which are excellent nectar-yielders; in fact, the whole territory is a natural bee country, so that the bee-men have a particular reason for wishing the government to acquire the land. If conducted as a forest reserve, bee-keepers would be allowed to place their apiaries there without charge, and yet overstocking would not be allowed. As a matter of fact, it would constitute a beekeepers' preserve. Instead of deteriorating in the hands of Uncle Sam, its value for bees would in all likelihood increase.

The territory involved would make a fair-sized State as regards size and resources; but it will really do the whole United States more good to set it aside as a forest, because the factories in the valleys must have lumber at reasonable prices or their industries will cease to exist. With a forest reserve, almost their entire supply of lumber is assured for ages to come. Much of the water power can be utilized for electricity, and other uses of the reserve will appear from time to time. The idea now is to prevent land-grabbing and the rapid and total destruction of valuable beautiful forests with which nature has

adorned and enriched the country. You are requested to write to your Senators and Representatives to support the measure when it comes up. W. K. M.

#### THE PARCELS-POST STRUGGLE.

HERE is what President Roosevelt had to say with regard to the proposal to establish a parcels-post service in the United States:

I commend to the Congress the consideration of the Postmaster-General's recommendation for an extension of the parcel post, especially on the rural routes. There are now 38,215 rural routes serving nearly 15 000 000 people who do not have the advantages of the inhabitants of cities in obtaining their supplies. These recommendations have been drawn up to benefit the farmer and the country store-keeper. Otherwise I should not favor them. For I believe it is a good policy for our government to do every thing possible to aid the small town and the country district. It is desirable that the country merchant be not crushed out.

In spite of the kindly sentiments expressed in the foregoing paragraph, a tremendous agitation has been developed against this modest effort to make life more pleasant for the farming population. Offices are being maintained in the principal cities of the country to combat parcels post. It will be remembered, however, that an equally fierce agitation was maintained against free rural delivery; but in the end the farmers won. They can win parcels post too if they will only make up their minds to have it.

All sorts of wild and unreasonable statements are being printed, and the mails flooded with them, inflaming against the Postmaster-General's idea. One of the stock arguments is that parcels post does not pay in Europe, when as a matter of fact it pays handsomely, and the people like it so much they could not possibly be induced to change it. In the British Islands the postoffice pays a handsome sum every year in net profits, which goes into the imperial treasury to help pay the expenses of the army and navy.

As to the argument that parcels post will injure the small merchant, there is assuredly nothing in it, because in Europe this individual makes great use of parcels post. He not only sends goods to local customers, but he receives considerable quantities by the same means. Valuable goods such as silks, jewelry, drugs, etc., are often sent by the parcels post from the wholesaler to the retailer.

Back of all this agitation are the express companies who know the parcels post is a great success in Europe, and they have succeeded in frightening the country merchant till he is in a condition to join hands with his old enemies the express companies.

The farmers can have parcels post if they will all write their congressmen to the effect that they want parcels post, and want it soon. For the women folks the arrangement proposed by the President would be a wonderful convenience; for by using the telephone they can order goods from town and have them delivered at the door on the same day.

Get your husband or brother to write a letter to your Representative at Washington, insisting on a parcels post at an early date. Don't delay. W. K. M.

### TOO MUCH DRONE COMB.

"Say, Doolittle, can there be too much drone comb in a hive for the bees to prosper?"

"Too much drone comb in the brood-chamber is a very serious damage to the honey crop, as drones are only useless consumers, so to speak, being of no value except to fertilize the queens, or, perhaps, to keep up a little warmth in the hive at times just after swarming when the workers are few in numbers because the great bulk of them went with the swarm."

"But I am told that lots of drones should be reared so that the queens need not go far from home to mate."

"Such talk as that belongs to the past; for in these days of progress no person can afford to allow a promiscuous production of drones. One or two square inches of drone comb is all that should be allowed in any hive except one or two containing the best drone-breeders, and these should have enough drone comb to rear all the drones needed for the fertilization of all the young queens, which also should be reared from the very best mother. The time has passed with the thoroughgoing apiarist for allowing his queens and drones to be reared from haphazard stock."

"But colonies will have some drone comb any way, will they not?"

"Yes, most colonies will have a little drone brood any way, even if they have to cut down worker comb to get a place to build the drone size of cells; but if we allow each colony from three to four square inches of drone comb it seems to satisfy them just as well as a whole frameful, and in this way we can have very nearly our own way in this matter."

"But if I have a hundred colonies with from three to four square inches of drone comb in them, will not these colonies raise from such comb, in the aggregate, more drones than will my two choice colonies with two or three frames of drone comb in their hives?"

"Yes, if you allow the drones to mature and fly from your hundred colonies."

"Well, how am I to keep them from doing this?"

"Keep the drone comb confined to just one frame in any hive, except those containing your breeders; and if you put this one frame next to the outside of the hive the queen will be slower in laying eggs in the cells, while the bees will be just as well satisfied. Then if you will paint red the top-bars to the

frames containing this drone comb you can see them as soon as you open the hives, and thus you will know right where this comb having drone-cells is without having to hunt the hive over for it. Now, if you will lift this frame every 21 days and shave the heads off all the capped drone larvæ you will have little trouble in keeping down all the drones in the apiary except those from the breeding queens."

"But that would make a lot of work."

"Not as much as you think, inasmuch as it will be near the swarming season before any drone brood will be capped, if the frame is kept next to the outside of the hive; and, besides, if left there the bees will be likely to fill this comb with honey as soon as a good yield from the flowers comes on. Then, as soon as swarming is over, the young queens will very rarely lay in the drone-cells where a comb is kept next to the side of the hive, and so three times is sufficient any season for decapitating drones, while, as a rule, once or twice is enough."

"But nearly all of my hives have several patches of drone comb in them, and some whole frames full. How am I to get rid of this?"

"The nicest way is not to have drone comb built, by giving frames of foundation in the start to such colonies as will not build all worker comb."

"That sounds well; but my frames are already built full of comb."

"In such a case, if you wish the slickest job done you ever saw you will cut out the drone-cells and give the frames so fixed, one at a time, to nuclei, or weak colonies having a young prolific laying queen. Such colonies will 'patch' up such combs so you can hardly tell where you cut out the drone-cells. By having one such weak colony or nucleus to every ten combs you wish patched, you will get them all changed to nice *all-worker* comb in one summer season."

"But is there no way that I can do this patching myself during the winter months when I am not so driven with work as in the summer time?"

"Yes, if you have the combs away from the bees and you do not care for quite so nice a job as the bees will do."

"Well, I am not so particular as some, and I have a lot of combs with more or less drone size of cells in them stored away in my comb-closet now, which I could work at just as well as not these stormy days."

"That being the case, you can cut the drone comb out and fit worker-comb in its place. If there is a large patch of drone comb in any frame, cut it out with a sharp narrow-bladed knife, after which you can lay this frame over another one having some drone comb in it also, so as not to spoil a good comb. Lay it so that the empty space comes over the worker-comb, when the lower comb is marked a 'hair' larger than the space to be filled, after which the marked piece is cut out and pressed into the place where the drone comb came from. If you happen to get any piece a little too small, a

few drops of melted beeswax will hold it till the bees fasten it."

"But some of the places in my combs have only an inch or two of the drone size of cells. Will it not be a big job to fix all of them?"

"For small patches, from one to four inches in diameter, you can use punches of the proper size, made of old fruit-cans. These can be found about hotels and eating-houses, if canned fruit is not used in your own family, and need not cost any thing. For the smaller sizes old empty baking-powder cans are just the thing."

"But how am I to fix these so I can use them?"

"When you have collected your different sizes, place them on a hot stove, when the solder will melt, thus letting the bottom drop. In the same way melt off the top. After the tops and bottoms are melted off, make the whole circumference of one end sharp with a file or grindstone, sharpening wholly from the outside. Now lay the comb down on a smooth board, and with the right size of punch cut out the patch of drone comb by twirling the punch or can around as you press down upon it. Now push out this piece of drone comb, and with the same punch, and in the same way, cut out from some discarded comb a piece of worker comb, which will, of course, exactly fit the place from which you took the drone comb. In this way it is no great task to rid all of the frames of drone comb, especially if you have the combs away from the bees so you can do it on stormy winter days."

"But a part of my frames have honey in them, so I can not tell just where the drone comb is situated. What of these?"

"If you do not wish to warm them up and extract the honey from them, the better way is to leave them till the bees can take the honey out in the spring, when they can be fixed in the same way."

"I have a few combs that were drawn out from foundation in wired frames. Some of these, on account of mice, or because moths or moldy pollen caused the bees to cut out portions of them, have either holes or drone comb in them. Is there any way I can fix these during the winter?"

"Such combs I prefer to leave for the bees to fix, as I told you about at first; but even these can be fixed in the winter. After the drone comb is out, cut away the cells all around the hole about one or two cells back, cutting only just down to the septum, on one side. Then cut a piece of foundation the size of the place and lay it down so that it will cover the hole and the cutaway cells as well. Now put a few drops of hot beeswax about the edges—just enough to hold the foundation in place. The bees will draw out the foundation into comb next summer, fixing it as good as new, providing you give such combs to the bees just at a time when they are securing honey enough to build comb. If you give frames of comb, patched in this way, to a colony when no honey is coming in from the fields, or not

enough so that wax is secreted, the bees are likely to tear away the edges of the comb or foundation, on the principle that 'Satan finds some mischief still for idle hands to do.'"

#### THE VALUE OF BEES AS FERTILIZERS OF FRUIT-BLOSSOMS.

The Ontario Agricultural and Experimental Union, with over 7000 experimenters, consisting of many of the best agriculturists in the province, at its annual meeting at the Ontario Agricultural College, Guelph, Dec. 9 and 10, passed a resolution requesting the Minister of Agriculture to arrange to have a series of experiments carried out to determine the value of bees in the fertilization of blossoms such as fruit, clover, and buckwheat. Prof. H. L. Hutt, B. S. A., Horticulturist at the college, is strongly impressed with the value of bees for his line of agriculture. He gave the following extract from his recent report to the Fruit Experiment Station Board:

In closing this report I wish to call attention to some of the conditions which have materially affected the fruit crop of the province during the past season.

In the first place, the weather has been exceptional. The winter was not severe, and fruit-trees as a rule wintered well. Bloom was abundant; but during the time the trees were in bloom the weather was cold and windy, and unfavorable for the working of bees, which are the most active agents in the pollination of the blossoms. In fact, there were only two bright warm days, and these several days apart, during the whole season of bloom when the bees worked at all freely. Mr. Murray Pettit informed me that he noticed two distinct settings of the fruit on his cherry-trees, which he believed corresponded to the two good days the bees had for pollination.

In the second place, there was an unusual scarcity of honey-bees this year to do all the pollination necessary to the setting of a full crop of fruit. I was informed by a leading bee-keeper that not more than 20 per cent of the honey-bees of the province were wintered successfully last winter. This being the case, it is easy to understand the effect that a scarcity of bees with unfavorable weather for their work had in giving a light crop of fruit. I have noted repeatedly in various parts of the province that some of the most productive orchards have been those in which honey-bees are kept, and there is no question in my mind but that it would pay fruit-growers well to keep a few hives of bees merely for the purpose of insuring fertilization of fruit-blossoms. In sections where fruit-farms are close together, as they are in the Niagara district, the growers within a radius of one or two miles might coöperate and employ a competent bee-keeper to look after a good-sized apiary.

#### PLURALITY OF QUEENS.

At the Harrisburg convention and in other places I have expressed doubts that the presence of two or more queens in a hive will prevent swarming. It was pointed out that in running for extracted honey, and removing the honey from the supers as soon

as the bees begin capping, the conditions for swarming would not be favorable with one queen. So far as I know, all who have reported no swarms with a plurality of queens have had favorable conditions for non-swarming.

In the December number of the *Bee-keepers' Review* Mr. H. S. Philbrook, Oxnard, Cal., states, "In my experience two or more queens in one hive will not always prevent swarming. I had one last year, with two queens, that produced nearly 800 pounds of extracted honey; and then, just at the close of the season, it swarmed."

I am still of the opinion that it is more practical to improve in every feasible manner the conditions favorable for one queen to do her best, and stop at that.

#### LIQUEFYING HONEY.

An ideal way to liquefy honey is to bring the entire mass all at one time to the proper temperature. While this is scarcely practical, yet present methods may be much improved. With ordinary methods there is danger of scorching the honey on the outside of the mass while the center is still granulated.

You know, Mr. Editor, that the best way to melt beeswax is to allow it to run away from the solid part as fast as it melts. This principle, I am sure, is the best for liquefying honey. There are many, however, who can not do this; but there is a method that almost any one can follow whereby a great difference between the temperature of the center of the granulated block and that on the outside can be avoided. This method will also reduce the amount of work necessary, and the danger of scorching the honey nearest the source of heat is lessened. Such a method consists in keeping the honey in a warm room (the warmer the better up to 100°), until the very center of it has the same temperature as the room. A comb of granulated honey put into a hive with a strong colony in some position where the bees will have no desire to replace it with brood offers us a fine object-lesson in liquefying honey. Exposure to a temperature not higher than that of the hive brings it back to the liquid state, and does not impair the quality.

[We regard this suggestion of our correspondent as a valuable one. With the ordinary method of liquefying, there is always danger of overheating the honey and thus spoiling the flavor. A large can or vat to hold the hot water is necessary, and it requires considerable hard work to liquefy in that way.

With the hot-air method, on the other hand, there is little danger of overheating. If a stove can be set up in a very small room there would be no need of further apparatus. Or it should not be difficult to confine the heat about a stove, even in a large room, to keep the temperature of the air surrounding the honey somewhere near 100°.

It may be that some kinds of honey could not be liquefied at a temperature of 100° with-

out wasting too much time and fuel. Alfalfa honey, which candies with a very coarse "grain," and therefore liquefies easily, requires about 24 hours' exposure to air heated to a temperature of 100°. Candied white-clover and basswood honey, which are much more solid than alfalfa, would probably require a much longer time, and possibly a higher temperature.

We should be glad to receive reports from any who may have tried the hot-air plan of liquefying.—ED.]

#### HOW BEES DISTINGUISH COLOR.

I have been accused of being like the fellow from Missouri, "You got to show me." I do not like to jump at conclusions, but enjoy giving a good fair test before believing it. I have sometimes been amused by a long argument as to just how certain things ought to turn out; but when you try them they just won't work. The trouble with too many theories is that the theorist does not take into consideration all the circumstances. I had the pleasure of trying an experiment the other day that gave, as I think, conclusive results. It has been claimed that bees dislike black, and will sting any thing black much quicker than any thing of a different color. I have believed this also, as I thought the bees were crosser with me when I had on black clothes. The following experiment removed all doubts in my mind.

I was out among the bees when out came a black dog belonging to one of the neighbors. In a minute, out came a brown dog from another neighbor. I was dressed in gray. Now I thought I would see which dog the bees would sting more. This seemed a little cruel, but I thought that, as long as I took my chances with the other dogs, and we all had an even break, there would be no kick coming. I called the dogs in front of a hive and began to bark at them and play with them. We all jumped and tore around in front of the entrance at a great rate. I kept a little nearer to the hive so as to see that the dogs got a fair deal. In a moment some of the bees began to lodge in the black fur of the dog, and stick there like cockle burrs. They went clear around me and the brown dog. At last one got Rex (the black dog) where the hair was short—i. e., on the nose. He withdrew to the brush to sneeze a little. I had determined to give three trials, then count up all the stings, average it up, and see just what per cent madder a bee got at a black object than it did at brown or gray.

Rex subjected himself to this second test with more or less reluctance; but by dint of hard coaxing and barking I induced him to forget the past and have another romp. We kept getting nearer and nearer to a hive of doubtful repute when I called a halt long enough to give the hive a little jar. Then I jumped in front with the other dogs, and began to jump around with them. At least a dozen bees took a bee-line for Rex and got next to his feelings at the very first dash. Rex never said a word, but turned around and skeedaddled for home. He never thought to yelp. His mental capacity was occupied in the discussion of two important points—first, how he might insert space between himself and that hive; and, second, how this might be accomplished without occupying too much time. I did not know exactly what to call that test, the color line or the race problem. Rex arrived at the door a little ahead of time, and never stopped to knock, but smashed against it. It was shut, but it opened with a bang as Rex came against it. In he went, and crawled under the kitchen table. This was the second trial. The black dog had all the stings, and the brown dog and I had none. The third trial—well, that never came off. Rex positively refused to subject himself to further experiment, even in the interest of science. I do not consider him sentimental.

I thought some of continuing the experiment between the brown dog and myself, but—well, it was getting late, and we might both look black to them, and then there might have been some cranky old maids among them that were color-blind and lacked proper discrimination; and if any of them should show me any discourtesy I would have to say "stung;" so, all things taken into consideration, I concluded to be satisfied with the results as they stood.

#### ENEMIES OF BEES—THE ROBBER-FLIES.

These are two-winged flies, and are, I believe, next to the bee-moth and ants, the most to be dreaded of all the foes of our bees, among insects. There are two types of these predaceous flies—one that resembles the bumble-bees very much, both in size, form, and color, and the other much longer, and with long pointed abdomens. These latter are generally black, though one of them that is quite common here about Claremont is ash color. As these dart about on the ground in pursuit of their victims they are aided by their sober colors, as they can come near the desired prey without being discovered. These robber-flies have a very

strong beak, and, like all mature flies, suck as do also the bugs. They have also powerful legs, and I think they must also have such horny bodies that the bee is not able to inflict great harm with its sting, else would not the flies learn quickly, as do we, to be very wary how they grasp these well-armed insects? Is it possible that they have learned to hold the bee in such fashion that the latter can not use its poisoned dart? However it may be, the robber-flies do capture and suck bloodless many of our worker honey-bees. In some sections of the South they are so destructive that I have been told that bee-keepers at times have engaged boys to capture and kill them. I have never known them to be sufficiently common in Michigan, nor even here in California, where they abound much more than in the north-eastern States, so that they give serious concern to the apiarist. This is the more true as they kill many of our insect foes. Unfortunately they do not always rightly discriminate, as I once saw one capture and begin to suck the blood of a fierce tiger-beetle, one of our good insect friends. This shows how formidable these robber-flies are. The tiger-beetle, like the honey-bee, we should suppose would be more than a match for any two-winged fly.

I made one observation here at Claremont that will interest our readers. I saw the California bee-martin, or king bird, close by the bee-hives, and thought that here was a chance to learn whether the bees sting this bird, as they do the toad, in the throat, as they were swallowed. I saw the birds as they swooped down toward the hives, and soon, after he had darted forth several times, shot him, and, upon examining his stomach, found not any bees, but three of these robber-flies, so that, in this case, the king bird was befriending the bee-keeper rather than working against his interests. May be the king bird is usually more a friend than an enemy.

#### DRAGON-FLIES.

The lace wings, the old *Neuroptera* of Linnæus' classification, are so preëminently predaceous, and such recognized destroyers of our insect foes, that we are not surprised to find that one of them, the dragon-fly, or spindle, as it is sometimes called, is often a foe of the honey-bee. I have never seen the Devil's darning-needle, as it is often styled, do this evil work in Michigan nor here in California, where, however, owing to the scarcity of standing pools (their breeding-places) they are not a very common insect. In the Southern States, however, they are reported to be quite a serious pest at times. I have been told that boys have been hired to kill these and the equally rapacious robber-flies by the use of a whip with a long lash. It is said that they become quite skillful in thus circumventing the evil of the great insects. I have often thought I should like to see this performance. I should almost think the report "fishy" had I not had it from good authority. As in the other cases, we must remember that these swift

graceful insects are always in quest of our insect enemies, and so do much good as well as some evil.

#### THE PRAYING MANTIS.

These curious insects are limited in our country to the South and West. They belong to the order that includes the crickets, locusts, and grasshoppers, and so we might expect them to be voracious feeders on plants. They are the only exception, and feed exclusively on insects. Like the stinging bugs they have the front legs modified to serve as grasping organs. These, however, are long; and as the insect rests on these great jaw legs it looks as if it were on its knees. As it raises these same legs it has much the attitude of the minister as he pronounces the invocation—hence the name, though it might well be *preying* mantis, as the insect is a fierce destroyer of other insects. I have never seen these insects killing bees here, where they are quite common, though not as large as the ones I have from Florida. It is also true of these that they do much more good than harm.

#### THE MILLER IMPROVED INTRODUCING-CAGE.

Tinned v. Black Wire Cloth for Introducing.

BY DR. C. C. MILLER.

The Miller introducing-cage, gotten up some years ago, has been very kindly received, and has found its way for some time into supply catalogs. A few years ago I discarded it for what I thought an improvement, and this improvement has in its turn been thrown aside for the one shown in the illustration. A trial of some 50 of these for a year or more has confirmed the belief that they are much better than the Miller cage in more than one way, and more up-to-date in meeting the requirements of present-day practice.

With the aid of the illustration I'll tell you how one of these cages is made. The block, 1, is  $3\frac{1}{2} \times 1\frac{1}{2} \times \frac{5}{16}$ , the part that is cut out being  $1\frac{1}{2} \times \frac{1}{4}$ . On this, as shown by 2, is fastened a piece of tin  $1\frac{1}{2} \times 2$  inches. The tin is bent so as to leave a space to be filled with candy; and to make sure that this space is not too small, a round lead-pencil is held in it while two small wire nails are driven through the wood and tin, and clinched. Holes are punched in the tin on the side where the nails start in, but they are not needed on the other side. The block is laid

on a smooth pine surface, and mere driving sends the nails through the tin on the under side. The diameter of the pencil is a little less than  $\frac{3}{32}$  of an inch, which, as you see, makes a very slender pencil. A larger space could be used, but it must be remembered that, the more slender the candy-passage, the longer it takes the bees to gnaw through.

When you have got thus far you will see that the queen will have to turn a pretty sharp corner to get out. She would probably make it all right; but to make it easier for her, cut away a little more, beginning back  $\frac{1}{16}$  or  $\frac{1}{8}$  inch, and making a slanting cut. Of course, the block might be cut so in the first place.

The cage proper (3) is made of extra-heavy bright wire cloth, which costs five times as much as common painted wire cloth, but it will last ever so much longer, and is not so easily crushed out of shape, and the cost for

THE LATEST FORM OF THE MILLER INTRODUCING-CAGE.

each cage is so little that it is economy to use the better kind. Cut a piece  $3\frac{1}{2} \times 4$ ; wrap it around a stick  $1\frac{1}{2} \times \frac{1}{16}$ , and perhaps 4 inches long (unless you wrap it a little loose, better have the stick  $\frac{3}{8}$  thick), letting the wire cloth project over the end of the stick about  $\frac{3}{8}$  inch. About  $\frac{1}{2}$  inch from the other end tie around a wire, then fold in the projecting ends and batter them down. That completes the cage.

At the open end there should be a selvage edge, or else the edge should be folded outward about  $\frac{1}{2}$  inch. In the latter case, of course the piece should be cut enough larger to allow for the folding.

It is well known that we sometimes want a queen to be caged in a hive for a time without allowing the bees opportunity to liberate her, and at other times we want them to have that opportunity. This is especially the case in the up-to-date plan of having two queens

in a fertilizing hive, one free, and the other a virgin in a cage awaiting the removal of the first, and sometimes we do not want this latter to be freed for several days.

If we want a virgin, or, for that matter, any queen, to remain in a hive without being liberated, all that is needed is to shove in the block as shown at 4, and the bees can not get at the candy. Then when we want the bees to eat out the candy, all that is necessary is to draw out the block as shown at 5, so as to expose the candy to the bees.

The cage may be held in place suspended by a wire supported by a nail resting across the top-bars; or the cage may be merely pinned to the comb by a pin  $1\frac{1}{2}$  inches long, called a bank-pin. You can get half a pound of these pins for 21 to 25 cents, and the women-folks will be delighted to get what you don't need for the bees. In pinning a cage on a comb you will, of course, run the pin through the meshes of the wire cloth. Don't run the pin in level, but a little slanting, letting it point downward as you push it in. It will thus hold more securely.

Marengo, Ill.

[For the purpose of comparison we present here an illustration of the original queen-cage bearing your name, which cage has been listed in nearly all the bee-supply catalogs for years. We have carefully compared this with your new model, and in our minds the old one is just as good, and in some respects superior. It is true, the new model has a very simple plan by which the bees may be shut off from the candy, and this in itself is a good feature, because it is often (and generally) desirable to keep the bees away from

the candy a day or two before they are permitted to eat it out and release the queen. But we accomplish this by nailing a little strip of pasteboard over the candy of the old-style Miller which the bees gnaw away. Sometimes we use a little strip of tin secured by a nail through one end. This may be revolved around to close access to the candy; at other times it can be turned the other way, exposing it. This little strip of pasteboard could not be applied so handily to your new form of cage, and pasteboard has the advantage that it is *automatic*, because the bees will gnaw it away in 24 hours, and afterward eat out the candy.

But the new cage we consider greatly inferior to your old one in point of strength. There is nothing to protect the wire-cloth end from getting crushed; and, moreover, it is not easy to close up the end without a stopper of some kind. Indeed, your photograph shows the crumpled-up ends of the wires, which, to say the least, do not look neat.

We notice that you specify the wood block to be  $\frac{7}{8}$  inch thick; but  $\frac{1}{2}$  inch we would consider very ample. The thinner it can be,

and allow the queen room enough to turn around, the better it is for insertion between the combs; for in the height of the honey-flow it is desirable not to have them spread apart any wider than is absolutely necessary. Then, moreover, we sometimes introduce virgins in these cages by slipping the cage through the entrance. A cage  $\frac{3}{4}$  inch thick with the wire cloth, as yours would necessarily be, might not go into an ordinary  $\frac{3}{4}$ -inch-deep entrance, while one having the wood  $\frac{1}{2}$  inch thick plus the wire cloth will pass through.

To sum up, we do not see that you gain any thing except in the matter of shutting the bees from the candy, and you lose considerable in the strength of the cage as well as its general appearance, which, to a supply-dealer and manufacturer, is a matter of considerable moment.

But there is one thing more which should not be overlooked. You recommend *tinned* wire cloth. While, as you say, its greater expense does not cut any figure in any thing so small as this, yet experience has shown that this material is the very worst that can be used for introducing-cages. We formerly made the Miller cages of tinned wire cloth, soldering the joint. It was a very much neater-looking cage; but we found that young queens were dying in all such cages very badly, and we soon began to get unfavorable reports from customers. We made the Titoff queen-cell and introducing cage of tinned wire cloth, and very soon our boys began to report that the queens, for some unaccountable reason, were dying at a very rapid rate. We could not account for this at first, especially as the *same* cage made of black painted wire cloth gave uniformly good results. Then we resorted to the expediency of boiling all cages made of tinned wire cloth, thinking that would remove all poisonous solder salts; but still the queens continued to die. We finally concluded that the spelter (or, rather, we should say, the acid or chemical) used to bind the tin on the iron or steel wire was the cause of the trouble; for when we dipped these cages in hot wax there was no mortality. When, again, we made the cages of black painted wire cloth, there was none. So don't, doctor, whatever you do, change over to tinned wire cloth, for you will rue it if you do. We have such an immense amount of evidence in the form of complaints to show that it killed the queens that we have been obliged to abandon it in all queen-cage work.—Ed.]

### SELLING HONEY.

Advertising, the Best Solution of the Low-price Problem; a Conversation with L.

E. Mercer.

BY H. H. ROOT.

On p. 1369 of the Nov. 1st issue, mention was made of Mr. L. E. Mercer's visit at Medina. Mr. Mercer is a bee-keeper who has passed the experimental stage in the busi-

ONE OF L. E. MERCER'S OUT-APIARIES IN CALIFORNIA.

All of Mr. Mercer's yards are arranged on the same general plan, which might be compared to a mammoth wheel. The honey-house is the hub, and the rows of hives the spokes.

ness. He has, at present, 1800 colonies located in out-apiaries near his home in Ventura, California; and if such a term may be used in an apicultural way, he might be called a professional bee-keeper—that is, he is a man who makes bee-keeping his business—his *profession*—and not merely his pastime. The opinions of such a man are likely to be worth more, perhaps, than those of an amateur, even though the amateur be an experienced bee-keeper, for the opinions of the extensive producer are sure to be practical, being the outgrowth of hard study from the standpoint of dollars and cents.

When Mr. Mercer was at the "Home of the Honey-bees" he had been traveling for six weeks, and he said that, during this time, he had seen almost no honey in the stores for sale, nor could he see any evidence of any advertising of honey. He believed that, if the right kind of man were employed to travel in the interests of the honey-business, there would not be enough bee-keepers in the country to supply the demand. The prices would then become more nearly what the prices of good honey ought to be. On being asked if he did not think the pure-food law would tend to raise the price of honey, he replied he thought that it undoubtedly would, but that some hustling would be necessary also, to get the public to see that honey is really more of a necessity than a luxury.

Mr. Mercer is right. The number of families that buy honey regularly is lamentably small. In order to make any great increase

in the price of honey, the producers ought to make an organized effort to make the consumers recognize honey as a necessity instead of a luxury. The *Honey-producers' League* was a move in the right direction, but some were suspicious.

Our attitude in reference to manufacturers as officers of bee-keepers' associations is clearly defined, p. 1489, Dec. 1st GLEANINGS. The control should be in the hands of the *producers*, for whose direct benefit the movement is carried on.

Now that the National Association has the funds of the Honey-producers' League, the producers have a chance to do some profitable advertising. Whatever is done, it is certain that honey must be systematically advertised if the price is to be brought up to the desired point.

One simple and effective way of city advertising which Mr. Mercer mentioned was the use of cards in street-cars. Every one is familiar with the advertising cards thus displayed, and it is not surprising to find that such a way of getting honey before the public has also been found successful.

#### AN INEXPENSIVE METHOD OF SELLING LIQUID HONEY.

Mr. Mercer told of one good way of selling honey which one of his sons has made use of in California. Various grocers in a city are supplied with honey-tanks, small enough to stand on a counter, but large enough to hold twenty or thirty gallons. These are gotten

HOME AND APIARY OF J. B. BARTLEBAUGH, GLENCAMPBELL, PA.

up very attractively to harmonize with the surroundings in any first-class grocery. The lettering is in colors that present a striking yet refined appearance. On the front, in plain sight, a gauge constructed of clear white glass is placed to show the height of the honey in the can, and also to call the attention of the customer to the fine color of the goods. A faucet or gate at the bottom permits a sample to be given to any intending purchaser, and also serves as a means for drawing off any amount in bottles, cans, pails, etc. The idea is that the honey is not drawn off until it is purchased. The producer, or dealer who sells the honey, is notified whenever the can needs refilling.

One great trouble with all such plans has been that the honey would surely candy in time, making considerable trouble for the dealer. Many grocers, on this account, prefer to have liquid honey put up in popular-sized packages. Furthermore, this conforms more nearly with modern methods of buying. It is becoming less and less common, for the higher class of grocers especially, to keep any thing in bulk, the tendency being to have standard packages that can be sold over the counter.

But, although the Mercer plan has some objections, it proves an easy and profitable way of selling honey in many cases. Oyster-pails may be used very successfully for holding liquid honey, and they would be especially valuable for this plan.

Descriptive literature might be on the counter beside the honey-tank, for the purpose of explaining the methods of producing the liquid honey, for telling of the value of honey as a food, etc.

A NEW ARRANGEMENT OF HIVES IN AN APIARY.

Mr. Mercer is the inventor of many conveniences in the apiary, some of which have already been illustrated in these columns.

His system of arranging hives in out-apiaries is unique. This is shown in the cut on preceding page. It will be seen that the hives are in rows, arranged like the spokes of a wheel, with the honey-house in the center. This means that there are no corners to turn in wheeling honey into the extracting-house. Where the ground is smooth this plan will be of especial value, since a straight line is always the shortest distance between two points, and much time can be saved if the operator does not have to waste steps in wheeling extracting-supers to the honey-house by a roundabout way or around sharp corners.

#### A MINISTER WHO ATTRIBUTES HIS SUCCESS TO GLEANINGS.

BY REV. J. B. BARTLEBAUGH.

You may see by this little picture that I am a lover of those little friends we call the bees. I have 26 colonies of fine bees from which I have just finished taking a fair crop of surplus honey, leaving them in good condition for the winter. I want to thank GLEANINGS for my success; and may it continue its usefulness, both on account of its value to the bee-keepers and because of the Christian spirit that is in it.

Glencampbell, Pa.

#### WINTER CASES OF TAR-PAPER.

The Boardman and Alexander Feeder Combined.

BY HARLEY CONDRA.

I decided to make some winter cases for my hives after seeing them recommended in GLEANINGS. I put them on early in the fall, and I can say that the results have been far

better than I expected, and I feel well repaid for my trouble. They can be placed on the hives as soon as the surplus honey has been taken off, and they will not interfere with feeding in the least when a feeder is used like that shown in the illustration. I call it my Boardman-Alexander feeder.

The capacity of the Alexander feeders increased by the addition of the fruit-jar as shown.

The winter case is made of tar-paper, which is tacked to the empty super as shown in the illustration. The ends of the paper are left long enough to double-lap across the end of the hive. I place my colonies in open sheds and pack them with straw.

Seymour, Iowa.

[The plan for increasing the capacity of the Alexander feeder is good. By cutting down the partitions of the projecting end, any Alexander feeder could be adapted to take a Mason jar.

Your plan of making a winter case does not provide for extra folds of paper or other

packing around the sides of the hive; but with straw between the hives in the shed, a material under the tar-paper would probably be unnecessary.—Ed.]

### FOUNDATION FOR COMB HONEY.

The Split-section Plan vs. Hot Wax for Securing Full Sheets; Buckling; Double Starters vs. Single Full Sheets.

BY E. F. ATWATER.

[In our last issue, p. 82, we used a part of Mr. Atwater's article because the report of his experience was timely in connection with that discussion. As promised, we present herewith the engravings mentioned, together with the rest of the article. In order to get the discussion fully in mind, the reader should turn back to p. 82 and read especially the part of the article that is omitted here.—Ed.]

In regard to the various methods of putting full sheets of foundation in sections, as practiced by Mr. Hand and some others, I would say that those methods are by no means faultless. The method used by Mr. Hand would seem to be very expeditious; but I call on him for the *proofs* that his method is the most rapid known for putting in full sheets of foundation. While not posing as an exceptionally rapid worker I have taken sections from the crate in which they came, folded them, put in full sheets of foundation, and replaced them in the super, at the rate of 400 in an hour. Of course, this is not an average; but 250 per hour is easily reached and maintained, while others claim to (and can) put in both top and bottom starters at the same rate per hour.

But there are other objections to the Hand method. One is that the edge of the sheet of foundation is so evident in the finished product that it tends to create and maintain a belief in the artificiality of the product. Another fault: With our methods, sections go from crate to super, and, with the one handling, are all ready to pile away to await the needs of June; while with the Hand method all must be rehandled, as they are first folded and put into the wide frames; then they are pushed half way out of the frames, and the foundation inserted. To our methods must be charged the time required to cut the foundation.

In many cases the results, when a full sheet of foundation is fastened on all four sides, are all

WINTER CASES MADE BY TACKING TAR-PAPER ON THE SIDES OF EMPTY SUPERS.

FIG. 1.—DRAWN COMB FROM A FULL SHEET OF FOUNDATION FASTENED ON ALL FOUR SIDES.

Note the bulge near the bottom, and also the one near the right side. Occasional buckling of the foundation causes this.

FIG. 2.—SECTIONAL VIEW OF FIG. 1.

that could be desired — beautiful slabs of honey without hole or blemish to mar their beauty. But here the (as yet) inevitable sagging propensities of all surplus foundation on the market, in hot weather, are a factor with which we must reckon. Perhaps the engravings will help to explain what I mean by this. I am sorry to say that, at this date, I have no examples of the results on the finished comb; but from my supply of bait combs many sections like those illustrated might be shown. In Fig. 1 the bulge at the bottom is very plain, as well as the bulge about eight cells removed from the right-hand edge of the section.

Fig. 2 is a sectional view of the comb shown in Fig. 1. This shows even more plainly the result of the sagging of the sheet of foundation.

Perhaps some one may say the foundation was of poor quality; but it was as good as can be had. In hot weather any foundation, light or heavy, will sag, and even horizontal wires but two inches apart will not prevent that sagging. Unless Mr. Hand's method will remove the difficulty, the *greatest fault* with any method requiring that foundation be attached on three or four sides is the expense and the amount of time required to do the work.

It will not pay the extensive producer to devote a great deal of time and labor to the fastening of foundation to three or four sides of the sections, as the price of the finished honey is not raised in any degree over that of comb honey produced in sections containing full sheets of foundation fastened in the ordinary way. Nor is it a fact that sections and supers prepared in the ordinary way require very careful handling at any time. When we can have a really non-sagging foundation, and when the honey will sell for enough more money to pay for the extra work, I may again use some method of using a full sheet of foundation attached on three or four sides.

Meridian, Ida., Dec. 26.

[GLEANINGS would be glad to receive reports from any who may have tried full sheets of foundation fastened on all four sides of the section. What percentage of the finished sections are irregular on account of the buckling of the foundation? If the sheets are warm when put into the sections, is there as great a tendency toward buckling when the supers are put on the hives?

If comb honey built from foundation fastened on all four sides could be sold at even one cent more a pound, this extra price would more than justify the time spent in

fastening such full sheets in the sections. Of course, if the appearance of the honey is not enough better to bring an extra price, then nothing is gained. But there is not enough strictly fancy comb honey on the market, and bee-keepers can well afford to experiment with any methods that will tend to produce better grades. Fancy comb honey never goes begging. It is the honey which is only "fair" in quality that makes the producer hustle to get rid of it at a profit.—Ed.]

### RHEUMATISM CURED.

#### Another Case of this Disease Cured by Bee-Stings.

BY HIRAM LANDIS.

[Our honey-man, Mr. J. A. Warren, recently became acquainted with a gentleman who had been cured of rheumatism by bee-stings. His statements proved to be so interesting that he was asked to write a short article for GLEANINGS, hence this letter.

It will be noted that the cure is every bit as marvelous as the fake cures so often lauded by the patent-medicine concerns, and yet we have every reason to believe that Mr. Landis' story is true.

Personally we have no faith in bee-stings as a cure for all forms of rheumatism, nor perhaps even for the same forms that afflict different individuals. There is no doubt, however, that it proves beneficial in many instances. Certain it is, there is no patent on the bee-sting cure; it is free to all who wish to try it.—Ed.]

HIRAM LANDIS, OF PITTSBURG, PA., WHO WAS RECENTLY CURED OF RHEUMATISM BY BEE-STINGS.

I am glad to give you any information you wish in regard to my successful cure of rheumatism, which, I am satisfied, is the only permanent cure in existence up to the present time, or at least the only one I have heard of yet. I suffered for seven months, and took all the truck imaginable; but nothing did me any good.

I paid a visit to an old friend, Mr. D. B. Travis, in Armstrong Co., Pa. I got acquainted with old Dr. Sharp in Dayton, Pa., on the B. R. & P. R. R. He said he would give me a cure, but added I would not take it—that it was a sure cure, as he had suffered for one year, and it had cured him. I told him I could take *any* thing he could. Then he told me to cover my face and roll up my sleeves and stir up a bee-hive and let them sting me in the arms all they would. I did so. I got 25 stings, and it never swelled. In a day or so I went back and got another dose of the same medicine. It never swelled; but the third time it swelled and I quit. I took no more truck to knock out my stomach, and I felt better every day; and in four weeks I went on the road and have been out in all kinds of weather for a year and six months. I have not felt the least effect of rheumatism since—not even in a change of weather. I have been on the road for 50 years, and feel like a four-year old boy.

My rheumatism commenced in my knees, and finally got up into my shoulders and arms. I could scarcely get out of bed. I could not put on my clothes myself for seven months until I got stung by the bees. Dr. Sharp told me that the poison of the stings would eradicate the poison or uric acid in the blood, and said I would get rid of my rheumatism.

Pittsburg, Pa.

### BEE-KEEPING IN QUEBEC.

#### A Foul-brood Act to be Passed.

BY R. F. HOLTERMANN.

Few outside and perhaps not many inside the province of Quebec realize the magnitude of the bee-keeping industry in that part of Canada. There are probably quite as many colonies of bees kept in that province as in Ontario, and yet there is a good deal of dissimilarity between the situations.

In dairying, Ontario is the great cheese-producing province, and Quebec the butter-producer. Likewise, in bee-keeping, Ontario is largely an extracted-honey producer, and Quebec a comb-honey producer. One of the weakest points in the production of honey in Ontario, as perhaps in all extracted-honey-producing sections, has been the marketing of unripe honey; and one of the weakest points in the production of comb honey in Quebec has been the production of combs attached only to the bottom and sides of the sections. The quality of the honey has been all right, but the combs must be securely fastened to the sections in order to take advantage of the best markets that may be at a distance. The remedy for this lies in using a full sheet of thin or extra thin foundation instead of the small starter generally used.

Quebec, owing to winter snow, has more natural clover than the present honey-producing sections of Ontario; but this may not be true when the more northerly portion of our province is developed. The source of

surplus honey in Quebec is largely white clover and buckwheat.

There are still many box hives in the province, and the writer is not as strongly opposed to them as some are, for the old let-alone plan of keeping bees goes better with the box-hive system than with the modern hive. But in these days, owing to the rapid transportation of bees, honey diseases are more easily spread; and on account of the known fact that there *is* disease about, no

bee-keeping a great national wealth-producing industry, and they and the Germans appear to have a natural aptitude for the business. Thrift does not allow such a source of revenue and aid to other branches of agriculture to be lost.

Under the management of the Quebec Department of Agriculture, among other efforts to develop bee-keeping there have been sent out through the province a large number of lecturers. The writer has been among the number, and he has found the people of the audiences intelligent, deeply interested, and of an inquiring and receptive mind. I have very pleasant recollections of my work there.

The Hon. Minister, Mr. Jules Allard, is about to take a very important and necessary step in bee-keeping. Mr. A. Girard writes me, under date of Dec. 30, 1907, "At the next session of the Parliament of Quebec he intends having a law passed for the appointment of inspectors to fight the contagious disease foul brood."

Mr. A. Girard, editor of the *Journal of Agriculture*, who takes the very deepest interest in bee-keeping, stands in a very prominent and influential place, and is able to help the cause. It has been my pleasure to attend institute meetings with him, and I know he is ever ready to do all in his power to help in the development of this industry, for which he has a genuine affection.

Of the many bee-keepers who well deserve mention in this article, owing to limit of space the readers will, for the present, have to content themselves with a brief introduction to four gentlemen, all Canadians by birth, but two of English and two of French extraction.

Mr. F. W. Jones, Bedford, Que., is perhaps one of the very best-known bee-keepers in the province. He has done much to disseminate modern apicultural knowledge. He has not only been an extensive bee-keeper, but he does a large business in bee-keepers' supplies. From personal acquaintance with him for many years I know he possesses not only strong business integrity, but he seeks to do toward others as he would be done by.

Mr. C. O. Jones, Bedford, Quebec, is an extensive comb-honey producer, and these two last-named gentlemen have had the experience of competing with one another at Montreal exhibitions, even dividing the prize money when the judges did not act wisely. I have been in Mr. Jones' winter repository. He removes the bottom-boards from the hives, closing, however, about three-fifths of the space below by setting the hive on two other hives sufficiently far apart to leave open at the bottom two-fifths of the center space, running from front to back.

Mr. Jacques Verret, Charlesburg, Quebec, like the Messrs. Jones, speaks both English and French, and is of French extraction. He is an enthusiastic bee-keeper, and is a strong advocate of black bees. He prepares his colonies for winter in September, wintering only strong ones with plenty of stores. His bees are put into winter quarters about November 15, and for the last four years they

JULES ALLARD

F. W. JONES

C. O. JONES

JACQUES VERRET

A. L. BEAUDIN

colonies should be kept in such a way that the combs can not be examined, whether in the old box hives or in carelessly looked-after modern hives.

Referring to the illustrations above, the gentleman who is by right of position at the head of the bee-keeping industry is the Hon. Minister of Agriculture, Mr. Jules Allard. He springs of a nationality (French) which has had much to do with the development of bee-keeping. The French people have made

have been brought out on the second day of May. Eight pounds has been the average consumption per colony in the winter.

Mr. A. L. Beaudin, St. Chrysostome, Quebec, is one of the largest and most progressive French bee-keepers in the province. He is about 45 years of age, and has been interested in apiculture for many years. He generally has from 200 to 300 colonies of bees, producing extracted honey almost entirely. He uses the nine-frame Langstroth hive called "The Model." His crop of honey is generally white clover; and as he leaves the honey with the bees until it is well ripened, it is of excellent quality.

Quebec, having many natural advantages for bee-keeping, should do every thing reasonable in its power to develop it. If you, Mr. Editor, could recommend a French bee-journal it would be a help to many in that province who do not read English.

## THE TWO-QUEEN SYSTEM.

**This Plan Makes it Possible to Keep the Brood-chamber Packed with Brood During the Flow; Forcing Honey into the Supers; Wintering Two Queens in One Hive not Desirable.**

BY J. E. HAND.

*Continued from the Jan. 1st issue.*

In the first article on this subject I stated that no iron-clad rules should govern the disposition of a two-queen colony during the harvest, and I gave what I consider the best method of managing such a colony during a good honey-flow when the bees are likely to swarm more or less.

However, if the bee-keeper, after a careful study of the present conditions and future prospects of the honey resources of his location, decides that the harvest will be short, and, consequently, not much swarming, then it would be unwise to make artificial swarms as directed in a former article; and he will either keep the two queens in the same hive during the harvest or else follow the plan as outlined in our season's work with the sectional hive.

However, since the various hive manipulations necessary to the successful carrying-out of this system are quite complicated, and since feeding back is a science not well understood, and therefore is likely to cause trouble for the beginner, I would advise those who wish to give the two-queen system of comb-honey production a trial to follow the more simple methods as outlined in these two methods.

By expanding our brood-chambers during the breeding season (gradually by means of shallow brood-sections) prior to the harvest we fully develop the fertility of two queens

in one hive, thus securing a much stronger force of workers for the coming harvest than it is possible to secure with one queen in any hive. And then, at the beginning of the harvest, force this great army of workers to begin storing in the sections at once—not by extreme *hive* contraction, as in a former article, but by limiting the room in the brood-chambers during the harvest, so that two queens will have no difficulty in keeping it full of brood to the exclusion of honey, which must go into the sections.

Mr. Titoff claims that two queens are not necessary during the harvest; and cites for proof the fact that some bee-keepers restrict their queens during the harvest to two or three brood-frames. However, he seems to lose sight of the fact that, to restrict the queen during the harvest, without an equal contraction of the brood-chamber, would be to do so at the expense of a honey crop, since the honey would be stored in the brood-chamber instead of in the sections.

The successful comb-honey producer of to-day will not winter his bees upon stores of white honey with the corresponding difference in price between that and sugar syrup, as well as the superiority of the latter as a winter food for bees.

It is not only very desirable to have a brood-chamber full of brood during the breeding season prior to the honey-flow, but it is equally important to keep it full of brood during the entire harvest to the exclusion of honey. And such brood will put dollars into the pocket of the bee-keeper by holding the brood-chamber against honey during the three weeks of their hatching period, even if they never gather very much honey. However, such bees often come handy in storing honey from some unexpected source during autumn, and this is just what they did in our home yard last September.

Regarding the condition under which two queens may be kept in the same hive for any length of time, it is needless to say that this can be accomplished only by keeping the queens as far apart as possible, and for this reason it is safer to use a double queen-excluder and feed during a dearth of honey, not to stimulate brood-rearing, but to keep the bees busy and good-natured toward the queen. Further than above stated, it is not desirable to keep too queens in one hive, and I prefer to winter surplus queens separately in my shallow brood-sections with a small bunch of *young* bees. The fact that several queens may be safely introduced into the same hive, and that such will often remain together, is not strange when we understand queen nature, and only proves that it is possible to use a plurality of queens so far as the bees are concerned. If two queens meet, and the challenge to mortal combat is given and accepted, they will lock in a deadly embrace, and one is quickly killed; but if one refuses to fight, and runs away, the other will not pursue her, and this may be repeated every time the queens meet until the cowardly and weak ones pluck up courage enough to fight; and if two remain in the

hive for any considerable time it is safe to say that one of them is of no account.

While the two-queen system as above outlined will greatly discourage swarming by keeping the brood-chamber free from honey, yet I do not recommend it as a sure means of swarm control except in seasons as above described; and in case a swarm issues it is treated as described in a former article, and work in sections will go on with renewed energy

Birmingham, O.

## THE PLURAL-QUEEN SYSTEM.

**A Series of Interesting Experiments; Clipping the Queens' Stings so they Can't Kill each Other; do the Bees Take a Hand in Royal Combat?**

BY EARL BUSSEY.

How two queens may be kept in one colony, unseparated by queen-excluding zinc, and how long it is possible for them to remain in this condition without disaster to either queen, seems now to be the main question.

Having experimented along this line to some extent, and also having been in a measure successful, I will endeavor to explain *how* they may be kept in this manner, and *how long* it is possible for them to continue in this state.

After reading Mr. Alexander's article some time ago, wherein he stated that he had been successful in keeping two queens in one colony, I at once decided that, if the scheme were possible, I wanted to know something more about it right away.

You can imagine the exodus to the beeyard. Arriving there I immediately made preparations for the furthering of the experiment by getting in readiness a new hive. I then succeeded in extricating two queens from their respective abiding-places, each being accompanied by three frames of brood and bees. These separate combinations being placed on opposite sides of the hive, the cover was put in place and the whole removed to a new stand. The hives being eight-frame it will now be seen that there was an unoccupied space the width of two frames in the center, which was to serve the purpose of keeping them apart until such time as they should become reconciled to each other.

Three days after, no fighting having taken place, and as they were working nicely, I decided to look in on them. Removing the cover I lifted the frames from one side and found the queen doing nicely. On the other side I found the same state of affairs. I then removed the whole to the center so as to form one cluster, and replaced the cover.

Now then! The next day I removed the cover once more, and proceeded to investigate as to the success of the coöperation proceedings. Every thing was quiet and nice, with a few guards standing to attention around the outposts. I now had no doubt at all about the matter, and could almost imagine them drawing up a set of corpora-

tion laws or debating the question as to whether they would work more than eight hours. But on removing the frames I could find only one queen. Horrors! Is it possible that here in this peaceful-looking congregation there has been vile murder done, a tragedy enacted, or possibly a case of abduction? Perish the thought!

On thinking the matter over I came to the conclusion that the missing queen must be out taking an airing, leaving her sister to look over and attend to the wellbeing of the community, both having come to a previous understanding after a realization of the improved state of affairs. Yes, I would much rather think this way. Besides, that queen cost a dollar.

Next day I looked, and next, but still I could find but one queen. About this time I began to have doubts; and, to settle the question, I removed the remaining queen. It rained next day, and I left them alone; but the next day I looked in and found they had started queen-cells. This left no doubt about the matter, and I was forced to come to the conclusion that, so far, the two-queen system had proven a rank failure. But one swallow does not make a summer, and I was determined to have two queens work together in harmony. So, twice again I tried the experiment, with the same result both times.

About this time I was getting a little disgusted with the two-queen business; but I should certainly like to know what went with the missing queen. After studying the matter over for a couple of weeks I settled on a plan whereby I could find out whether the queens did fight each other; and if they didn't I would know it was the bees that did the killing. So I took two queens and cut off their stings by folding the abdomen over my thumb-nail, and pressing, when their stings came out and were amputated. These stingless queens being taken from a double colony, one above the other, with excluder between, did not have to be introduced in the usual manner, so I turned them loose at once, each on an opposite side of the hive. In two hours I looked in, and on lifting out the third frame I saw the two queens come together, and right there I witnessed one of the fiercest battles I ever saw. The bees stood around like referees, forming a circle around a prizefight, and not one of them offered to interfere. But as a battle it was a bloodless one, so I left them until late in the evening, when, on looking, I found them still fighting. One of them seemed to be getting the best of the other, for she had gnawed off one wing completely. So I separated them by putting one of them below the excluder, and I may say that they are just as I left them, both of them having done good work the rest of the season, and seeming none the worse for the loss of their stings and their battle.

I may also say that I have been successful in keeping three queens in one colony for five weeks. These queens were superseding, and were not a year old. The reason why they were superseding is that I had been

moving them from one queenless colony to another until such time as I could get queens for them. I let them requeen out of their second batch of cells, and could not see but they did as well as any colony in the yard. After five weeks, two of the three superseding queens in one hive came up missing. I think the reason the superseding queens do not fight is because they have the same instinct that the worker bees have; and when they have been laying heavily for some time they begin to feel their weakness, or want help, or are expecting to meet another queen at any time, any way. I also believe they may be kept together only just so long as they remain in this condition, and that, when they have rested up and have regained their normal strength, their jealousy will assert itself, and that will be the end of the plural-queen system.

Uvalde, Texas.

## THE PLURAL-QUEEN SYSTEM.

### How an English Expert Looks at the Question; the Advantages and Disadvantages.

BY JOSEPH GRAY,

*Traveling Expert in Apiculture, and County Council Lecturer.*

I have read with deep interest Alexander's new plural-queen system. We have in England the Wells hive, which takes two colonies side by side, divided by a central dummy made of wood, and perforated to allow the scent to pass freely to each stock. The bees work to the center, forming one cluster. A queen-excluder is used over the brood-nest, and one common super is used.

**Advantages.**—A mighty working force which will roll in the nectar from the fields and give a large surplus that no single colony will.

**Disadvantages.** 1.—A big unwieldy hive not easy to handle.

2. In winter the brood-nest is likely to separate and make two clusters, and one side is likely to attract more bees during the early spring flight, needing a more skillful management to adjust matters.

3. Often one queen turns up missing in the spring examination, but you get a big colony at the other end.

In my travels I find these hives are gradually going out of favor on account of the disadvantage first named.

**Swarming.**—There is less tendency to swarm, the mighty force bending their energy to storing.

**Locality and season.**—These are important factors in the case. Given a locality and season where there is a good flow, these colonies do well; but in a locality with a slow flow and changeable weather, the swarming may be raging, and all stores consumed in excessive breeding.

Alexander's new method has two points of interest to me.

One brood-nest, without perforations or ex-

cluder, where queens, two to five, can roam at will.

\* The matter of swarm control alone is worth all the experiments, and around it centers the chief interest in the new method.

There is one condition in which Mr. Alexander stands ahead of most of us. He has an ideal locality, with a certain and steady honey-flow. Buckwheat may account largely for his success where others will fail.

If Mr. Alexander has given to the world a system that even a limited number can use, that will permit a plurality of queens in a single brood-nest the year round, with complete control of swarming, he has undoubtedly made an epoch in apiculture, and his name will go down to posterity.

Long Eaton, England.

[Since the foregoing was received at this office Mr. Alexander has published a statement to the effect that the plural-queen system, without the use of perforated zinc, has not yet proven to be a success—see page 1496, Dec. 1st issue of last year.

From the testimony that has come in, it seems to be more and more clear that the dual-queen system will not work unless the queens are separated by excluders, and even then only where the colony is in a prosperous condition.

The testimony offered by our correspondent, that the Wells system in its modified form embodies the principle of perforated zinc, is interesting and valuable at this time. But we have known how, sometimes, devices and methods have been prematurely discarded only to be readopted years afterward, and finally put into successful use. The use of self-spacing attachments on brood-frames, for example, was tried some twenty or thirty years ago, and at that time they were generally discarded except by a few, but now they are in general use. It is possibly true, therefore, that the two-queen system in connection with perforated zinc was discarded in your country before it had had a fair test.

—ED.]

## REQUEENING.

Shall the Superseding be Done by the Bees or by the Apiarist? Killing the Old Queens only after the Young Queens are Laying; some Experience in Queen-rearing.

BY F. GREINER.

The bee-keepers we meet at conventions are an enviable, happy lot of people. They are generous; they give as freely as they partake. An enjoyable time is always assured, even should but half a dozen convene.

After having returned from the joint meeting of the Ontario and Seneca County beekeepers, with a few visitors from Wyoming, Livingston, Yates, Tompkins, and Monroe Counties present, I am filled with greater enthusiasm for the pursuit, and am better fitted to cope with the ever changing prob-

lems as they present themselves as time advances.

The address which I delivered on the subject of requeening and queen-rearing, after embodying the many suggestions received would read about as follows:

The minds of the bee-keepers on the topic of requeening are not agreed; but the general opinion is that young queens are more profitable than old ones. It is shown that colonies rarely swarm with queens of the same year's rearing—particularly so when large brood-chambers are used and honey-seasons do not continue uninterruptedly till late in the fall. Large brood-chambers full of large deep frames have a tendency to produce large quantities of bees, and these in turn give us large honey-yields; but the queens must be young and prolific.

It would appear, then, that the matter of requeening must be looked after by the apiarist himself. It seems to be the opinion that the bees themselves can not be depended upon to supersede queens timely, although something might be done in the line of breeding bees to perpetuate such a trait.

This matter is not lost sight of in Germany and Switzerland when selecting breeding-stock. With our average stock of bees, when nothing is done to renew the queens some colonies will be found every year in every large yard, which fail to breed up; and when this happens at a time when strong breeding is necessary to produce the bees for the harvest, our honey crop will be a failure from such colonies.

It will be cheaper, Mr. Taylor (of Michigan) says, to keep a few more colonies of bees to make good the loss from this source than to renew a lot of queens every year.

#### CHEAPER TO REQUEEN EVERY YEAR.

Other bee-keepers think differently. In fact, Mr. Olmstead, of Bloomfield, claimed that it is much cheaper to requeen every year in the spring by rearing the new queen in the same colony containing the old one, not removing the latter till the young one is laying, than to leave the matter to the bees and be bothered with the swarming trouble, holding that the work of rearing the queens in the very early part of the season is a great deal less work than to watch and examine each colony time and again for any swarming symptoms, and then deal with them accordingly.

A more general practice is to rear queens all along the working season and have them mated in nucleus boxes, and then introduce them where wanted, or wait till the close of the white-honey harvest, and requeen by giving a ripe queen-cell after removing the old queen. The former method is, of course, the more costly one, as it means the breaking-up of a few colonies of bees from which we might have obtained a surplus.

#### REQUEENING WITH NATURAL CELLS.

On account of convenience, many bee-keepers prefer to make use of their naturally built queen-cells found in the populous colonies of the yards. Undoubtedly this is a safe

plan, as the resulting queens will be fine, and free from the objection of having been tampered with.

#### THE ARTIFICIAL-CELL-CUP PLAN.

Other bee-keepers make use of artificial cell cups, stock them up with royal food, and transfer larvæ into them. Our friends in Germany call this a laborious method, while I myself hold the opposite view. It is the easiest way of obtaining the queen-cells in such numbers as are required, and at a time when needed. The pleasure derived from this method, the joy and agreeable surprise over the success crowning our efforts along this line, can not be estimated by those who never put themselves in touch with this exceedingly interesting branch of apiculture.

It would lead too far to describe minutely the whole process. Works on queen-rearing ought to be consulted. The government bulletin, written by Dr. Phillips in 1905, may be had for little money, and explains matters very plainly. The little book on queen-rearing, by the Root Co., is very good.

#### A FEW KINKS IN QUEEN-REARING.

A few kinks may be mentioned here which may not come amiss. Expensive implements and other auxiliaries offered by supply-dealers are not necessary to insure success. The dipped cells may be fastened to movable bars inserted in an empty brood-frame. If no royal food is at hand, the larvæ may be transferred without it. The bees will accept them just the same; but I would advise removing the thus transferred larvæ the second day, and make another graft.

One of the very best and at the same time simplest and cheapest instruments for taking up larvæ, without injuring either larva or cell, is a common pin pushed with its point into a small stick. This instrument has been tested by Mr. Olmstead, and will take up the smallest larva easily; and, again, the little bee-baby can be dislodged from it without any trouble. I think such a tool will facilitate the work, and, when known, will find favor with all who practice grafting cells.

#### DOES THE ARTIFICIAL METHOD TEND TO DEGENERATION OF STOCK?

I am entertaining the fear that, by following up this system of rearing queens by grafting larvæ, our stock of bees may deteriorate or degenerate. I do not think that any harm will come from practicing this method occasionally; for, by thousands of years of nature's breeding, the habits and the whole nature of the bee have become so well fixed that an accidental blunder or mistake on our part will not be noticed. It's a sure preventive of any degeneration. Mr. Olmstead has suggested to select always such queens for breeders as were reared naturally under the swarming impulse, without interference of man.

#### MATING IN UPPER STORIES NOT A SUCCESS.

So far I have not been able to make a success of mating queens in upper stories over an excluder so long as the old laying queen was present in the lower story. I will take

up this work again next spring. I have long since found that bees can be manipulated with less annoyance early in the season, particularly during fruit-bloom, than at any other time, and possibly I may succeed then in mating queens separated from the laying queen by perforated metal.

#### THE MATING-BOX NOT ALTOGETHER SATISFACTORY.

So far I have had all my queens mated in small mating-boxes during the clover-honey season. This is somewhat expensive, as a number of colonies will have to be broken up to form the small swarms necessary, and we do not obtain any surplus from them. What I desire is a perfectly safe method to rear queens in upper stories or within the hive somewhere with the old queen present and doing business. The very fact that bee-keepers and queen-breeders everywhere make use of nuclei and mating-boxes proves that they have not been any more successful than I have been in rearing queens without them. If a sure method were known, the mating-box system would be abandoned. It is perfectly practical to have the queen-cells built over an excluder in good strong colonies, but with me only a few queens begin to lay eggs. They come up missing generally. When the queens needed are reared in the same yard, even when the mating-box system is used, the introduction of them to other colonies during the honey season is simple, and reasonably sure. All we have to do is to remove the old queen and allow the new queen (fertile) to run from the comb of the mating hive over into a brood-comb from the other, right in among the bees. A queen heavy with eggs is accepted very readily, while one with a reduced or shrunken abdomen is objected to. The bees detect the difference between their old queen heavy with eggs and the one which has been kept out of the hive for even an hour or two. Such queens I can not introduce without caging; and the longer the queen to be introduced has been kept out of the hive the longer she will have to be confined in the cage before the bees may be expected to treat her kindly. If it can be so arranged that the queen is liberated by the bees during the night, all the better. The bees are so accustomed to the fact that strange bees never enter their hive and home during the night time that they take it for granted every thing must be right, and so they accept the new queen without molesting her.

Naples, New York.

#### THE JANUARY MEETING OF THE MASSACHUSETTS SOCIETY OF BEE-KEEPERS,

BY X. A. REED.

At the January meeting of the Massachusetts Society of Bee-keepers, in the absence of any regular speaker several topics were brought up for discussion.

Honey of different flavors was mentioned. A distinct flavor of spruce was noted where

the bees had visited the buds of spruce-trees. An acid taste in apple-blossom honey had also been found.

A very interesting account was given by Mr Chase concerning the origin and use of the pound and two-pound section boxes in Massachusetts. In the 60's he took a frame of excellent honey to Boston, calling to see if more was wanted. He found that even that was not sold. No one would buy five or six pounds of honey at once; and, realizing the fact that, if bee-keepers in Massachusetts wanted to sell their honey, it must be in some convenient form, he and Mr. Gould, of Ipswich, made suitable one and two pound sections, and in 1863 Mr. Gould sold a ton and a half of surplus honey.

Miss Cutter, of Princeton, gave her experience with the seventeen-frame Latham hive from which she obtained 111 lbs. of honey while her other colonies gave her no surplus.

As a result of his observations on weather conditions, Mr. Small, of Waltham, stated that the bees in spring and in early summer, and even in the fall, when asters are in bloom, work better when the nights are cold (almost frosty) if the temperature rises rapidly in the early morning. His theory is that the nectar is secreted by the flowers more rapidly, and is of a better quality under such conditions. The weather that, in early spring, causes a good flow of maple sap will, later, make the nectar more abundant.

A discussion as to the best kind of bees for both comb and extracted honey resulted in no agreement. The only point of harmony was that the Italians surpass the blacks and hybrids in gentleness.

This was our third meeting and it showed an increase over the first afternoon, there being twenty-one members present.

Our next meeting will be the first Saturday in February, in the evening, at the Ford Building, corner Ashburton Place and Bowdoin Street, at 7:30. These meetings should be attended by all members, as there are only three more "unless otherwise ordered." We expect to receive some new members at this meeting, and hope to see a lot of the old ones.

Belmont, Mass.

---

#### THE NEW YORK PURE-FOOD SHOW.

A PURE-FOOD show will be held in the Lenox Lyceum, March 26 to April 16. It will be managed and financed by the New York Retail Grocers' Union under the personal direction of Mr. L. J. Callahan. This show ought to be a great success, as the forces behind it are of a solid and reliable kind, not easily discouraged or defeated. Besides, New York is the best place in the country for such a show, and the Lenox Lyceum is central to the wealthiest class of buyers in America. Fancy honey ought to be very much in evidence at this show, as it gives a unique opportunity to impress the public with the superlative value of honey as a food.

W. K. M.

HIGH-PRESSURE GARDENING DURING THE  
FIRST WEEK IN JANUARY IN MAN-  
ATEE CO., FLA.

While we were discussing winter weather in this region, one of my good neighbors, Mr. Stanton, remarked that he had been here four winters; and as all four were very different indeed, he had ceased speculating as to what the weather would probably be. This is my third winter in this county. The first was unusually wet; the next (last winter), *unprecedentedly* dry, and, in fact, there was a lack of rain all summer until almost December of this present year. When I got here with my *barometer*, however, I began giving notice all around that rain was *coming*, and we had an abundance. On one occasion I said there was going to be a *big* rain or wind storm, and advised all to get ready for it. Mr. Rood had his men clear out the ditches and open up all depressions so there would be no standing water, and, sure enough, within 48 hours we had an almost continuous rainfall of about  $2\frac{1}{2}$  inches. There have now been five heavy rains in the past six weeks, with a week or more of beautiful weather between them, and the barometer has given prompt notice ahead of every one, almost as faithfully as a clock gives the time of day.

On account of the damaging dry weather for a year or more past, some very extensive (as well as expensive) irrigation plants have been put in. Within two miles of where I sit, a plot of 30 acres has been drained and fitted for trucking, and several acres of this are already equipped with the Skinner overhead sprinkling system. It was my pleasure to visit it when the apparatus was giving a veritable summer shower over a good part of an acre. The water is collected in pipes overhead, with sprinklers every few feet; and by rotating these pipes the water can be distributed very evenly indeed. Mr. Rood has finished laying tiles for sub-irrigation on two acres. A well has been dug, and a ten-horse-power gasoline-engine installed; but the abundant rains have so far prevented even a "trial trip" of the irrigation part. The tiles, laid only 20 feet apart, are, of course, doing their part, and Mr. Rood has now the finest field of Boston Market head lettuce I ever saw *anywhere*, some of it just heading up nicely. Now, here is a trouble some of you might not think of. At this date, Jan. 5, there has been (besides plenty of rain) most beautiful warm growing weather. The consequence is, every thing is coming on and maturing before the usual time; and that is not all—almost everybody, especially when they had good drainage, has a crop. I have

just heard a hint that lettuce in the northern cities is bringing only enough to pay the cost of package and transportation, leaving nothing for the grocer.\* This is quite a contrast to last winter, when the shipper was astonished by getting a price that almost took his breath away.

Well, neighbor Rood is all right on his strawberries if not on the lettuce. There are not only more of them, but larger and finer fruit than he ever raised before. It is true he has put the price down to 25 cts., but one day last week they picked 89 quarts, and he usually has his heaviest harvest in March. Whoever comes to Florida will find all garden stuff grown on raised beds, with some kind of open ditch between. Of course, tiles would enable us to have level fields like those in the North (or it *probably* would), but the cost—2 cts. per foot for two-inch tiles—is one item, and the peculiar soil in most of Florida is another. Let me digress a little.

There are no cellars in Florida—at least, next to none. I wanted a cement cellar for my two incubators; but everybody said it would get full of water. I thought I would show them. I dug a ditch along my line fence four feet deep. Such open ditches are quite common, and almost a necessity when you want to grow stuff. Well, I put a two-inch tile drain from this right *under* the bottom of my cellar. Then, to make doubly sure, I set the wall on a trench filled with broken stone, and this trench was connected with the tile drain. My cellar was all right until we had the  $2\frac{1}{2}$  inches of rainfall, mostly in one night. I said in the morning my cellar was all right; but the day *after*, water seemed to be oozing in from all sides, and up through the bottom. Right over the tiles it was comparatively dry; but everywhere else it was wet, and it took about ten days for that retentive spongelike soil to "let go" of the water from that shower. After repeated coats of cement on sides and bottom I have got a model cellar—at least I think so now; but the experience taught me a lesson. This wonderfully retentive soil is a great safeguard against drouth, and it enables us to transplant lettuce, celery, strawberries, etc., without watering, in a way I never heard of in the North. One big rain keeps things growing a long while; and after the roots get down two or three feet it is almost perpetual sub-irrigation. Of course, this condition refers mostly to low ground where open ditches have collected the surplus water away, and when, even in a dry time, water is running in open ditches three or four feet deep.

I replied to Dr. Miller that I had never succeeded in getting sweet clover to grow

\* Whenever lettuce is a drug it can be very profitably used for poultry; and where lettuce is being shipped, the refuse will be greedily devoured by the birds. It not only starts them to laying, but when they have access to plenty of crisp lettuce the amount of grain consumed is very perceptibly decreased. Here in Florida fowls must have a large amount of green food of some kind. Ours have sprouted oats all the time, but they seem to prefer greatly the lettuce.

here. I have now alfalfa and sweet clover growing fairly well under the influence of "cow-chips" (see page 1605), and the fertilizers used here for trucking.

In answer to many inquiries about the price of labor and chance of getting work, etc., I would say good faithful and able-bodied laborers get \$1.50 per day, 10 hours. Expert carpenters get \$3.00 for 8 hours; masons, \$4.00 for 8 hours; painters, \$2.25 to \$2.50. Now, I want to tell you frankly that quite a few northern people come down here and get disappointed in regard to work and wages. Many are too old to do a good day's work; others have worked a *little* at the carpenter business, etc. To get \$3.00 for 8 hours a man must be up to the times in his business, and he must "make the work fly" for the full eight hours. As a rule you can't do anything down here until you have learned how, and you must be bright enough to keep your eyes open and see whether you are doing as much as the people you are working with who get the same pay.

In regard to the locality for health, I think it a splendid place to spend the winter, especially for invalids and old people. The carpenter who builds our house said the doctors told him three years ago, in the North, that he could not live until spring, as his lungs were so badly gone. He now works right along, winter and summer. I think I will close with a letter from our old friend M. H. Hunt, one of the leading bee-keepers of Michigan, whom most of the bee-keepers know.

Dear Mr. Root:—I have just received GLEANINGS, and find in it you are south for the winter, and, of course, you have to garden a little. Myself, wife, and daughter have been here a month. I too have a garden, and it is looking fine. I have in onions, beets, turnips, radishes, lettuce, mustard, parsley, and cucumbers, besides some flowers. I suffer while north with stomach trouble, but I am always over it within ten days after landing here. I can eat any thing here without trouble afterward. I expect to remain south until the first of May. I went home last year the latter part of March, and made a mistake by so doing.

I have the use of a nice gasoline-launch and other boats, and enjoy the boating and fishing very much. I caught a fish last Saturday that weighed 18 pounds. The town of Crystal River is seven miles from the Gulf, which we visit two or three times a week. We take the ladies along and have dinner on an island where my friend Mr. Baum owns a house for the purpose. I have been to Bradentown several times, and think it about as nice as any town in the State. I know a gardener half a mile out by the name of Herman Crandall. He went there from near our home in Michigan. Four of my friends in Michigan will join me here next Thursday, and on the 9th of next month two more; and later on I expect more.

It is a wonder to me that more people do not spend the winters south. The beautiful sunshine and the warmth, with the continual growth of vegetables, etc., are very attractive to me—no more snow and icicles for me as long as I am able to make the trip. If you can get lime and put on your new ground it will sweeten it, and stuff will grow much better. My garden is an old mule-pen, and as rich as you could imagine.

Crystal River, Fla., Dec. 30.

M. H. HUNT.

My 26 Leghorn pullets that I raised last winter (one fourth game, you remember), are doing finely; and with eggs still at 35 cts. they pay their way very well. I shall have a "chicken story" for the younger readers of GLEANINGS soon.

#### SWEET CLOVER FOR PASTURE; SOME IMPORTANT TESTIMONY IN REGARD TO ITS VALUE.

Professor Thorne, of our Ohio Experiment Station, has called our attention to an exceedingly valuable article on sweet clover, which is clipped from *Wallace's Farmer*. Perhaps I should explain that the Wallaces, editors of the journal named, of Des Moines, Iowa, are about as good authority on all the clovers, perhaps, as any people living. Below is the extract:

Mr. Frank Coverdale, of Jackson Co., Iowa, has for some time been advocating through the press and at farmers' institutes the use of sweet clover (*Melilotus alba*) as a pasture grass. Many regard sweet clover as a vile weed growing unshown by the roadside, and we are often asked how to get rid of it. Therefore it has surprised many farmers that any farmer should advocate its cultivation. Mr. Coverdale, however, is not the first one to advocate it. As much as twenty years ago a farmer in Madison Co. was a staunch advocate of this plant, using it both for meadow and pasture. We once visited his farm and asked him if he did not have difficulty in getting cattle to eat it. He replied, "Not when they once become accustomed to it." In order to find out what there is in this thing we sent Mr. Coverdale the following questions:

1. How many acres do you have in sweet clover?
2. How long have you made a practice of pasturing sweet clover?
3. Do you have any trouble in getting your cattle to eat sweet clover?
4. When do you turn them on it in the spring?
5. Will they eat it after it has grown up a foot to eighteen inches?
6. Will cattle which have not been on sweet clover, and practically starved to it in the beginning, eat it?
7. Is your sweet-clover pasture entirely sweet clover, or do you grow other grasses with it?
8. How long can you keep a field in sweet clover when you follow the practice of pasturing it closely, and not permitting it to bloom and seed?
9. Where do you get sweet-clover seed? and how much do you pay for it?
10. How do you seed it to make a pasture? and how much seed do you sow per acre?
11. How many steers will a forty-acre sweet-clover pasture carry through the grazing season?
12. Are any of your neighbors sowing sweet clover for pasture?

In answering the above, Mr. Coverdale has sometimes grouped two or three questions together; but his answer gives a clear statement of his experience as follows:

1 and 2. I have pastured 35 acres for 4 years; have also sown small patches here and there in an experimental way. This field was sown to timothy and sweet clover except a little strip of alsike, which is now nearly gone, and it is now a thick mass of sweet clover and timothy with blue grass coming in.

3 and 7. My cattle make no choice between this and other grasses. All are eaten with equal relish, as you will see from the photograph of my cattle in the pasture, sent you herewith. Timothy grows with it, also a little alsike and blue grass, and it is all eaten together.

4. I have always turned cattle on in the early spring, as this clover is a week earlier than the other clovers.

5 and 6. Cattle turned into a field of the clover a foot high act as steers do that are brought from the range and introduced to a trough of corn. At first they will not eat it; but they soon catch on, and thrive on it. My cattle never refuse to eat sweet clover. If the plants become old and woody they will browse on the tops or any part of it that remains green.

8. If a field of sweet clover is pastured close to the ground, three years will finish it. One man here turned too many cows on a small plot of it, and it is seriously injured; whereas it ought to grow better year after year. I sold one man enough seed to seed a small field for hogs, and they have completely destroyed it. He has simply put on too many hogs for the pasture. Another man had a small hog-lot of old plants started, and by the first of June it was eaten out root and branch.

9. I purchased my seed in Chicago at a cost of \$3.00 per 100 lbs. I think it is found most generally in the Southern States.

10. This 35-acre field was sown with timothy and sweet clover after being plowed and harrowed, just as you would seed to alfalfa. The ground should be put in good condition, and the seed covered shallow. In this respect it seems to differ somewhat from red clover, which should be covered deeper. It should be sown thicker than red clover to get the best results. It will not smother out either timothy or blue grass. In fact these grasses do their best when sown with sweet clover.

11. I have never found out the capacity of this thirty-five acres for yielding grass, as it is such a rapid grower. However, after once getting established it will very far outstrip any other clover that grows here, and should be better as the years go by, which is not true of any other clover. Tramping the ground benefits it, provided it is allowed to reseed itself each year. Other grasses will come to the front if sown with sweet clover.

12. My neighbors are just beginning to wake up to the value of this crop, and are purchasing seed to sow from ten to forty acres for pasture.

I sowed 70 acres last fall on stubble, and hoped to get a good catch. It was sown on the bare ground early in December, and proved an entire failure, only a bunch here and there surviving. I have never failed when I put it in in the spring, covering lightly, and then turning on the cattle. The tramping does it no hurt. However, the soil should be inoculated with soil that is full of the bacteria, which seems to be the same as that of alfalfa. A good stand can always be secured by sowing with oats and pasturing moderately. Last spring I sowed a narrow strip through the oats-field, and at this writing it is a fair stand of slender plants that look rather sickly, just as alfalfa would look under similar conditions. Inoculated soil should have been sown with it and covered with the seed.

July 23 I took steers off from this 35 acres in order to let it grow up for seed. I harvested the seed Aug. 18, and part of the steers that were not shipped were turned back on it Aug. 25, by which which time the young clover growing up was 20 inches high. It was eaten at once with evident relish. The mower-bar was run over the top of this young clover ten or twelve inches from the ground, thus allowing only the tops of the old clover for seed. The steers will make heavy gains on this field.

After my four years' experience with sweet clover I would advise farmers not to put too many cattle on the field if they wish to fit them for market, as I have done, and save two months' feeding of expensive corn. My cattle that were shipped off this pasture (without corn) weighed 1163 lbs. at Chicago, and brought \$5.75 per 100 lbs. while other cattle on the market at the same time, and of better quality, brought from \$4.90 to \$5.25. Mine went on grass thin, while the latter went on in better flesh. My cattle had a nice sleek coat, similar to corn-fed cattle, and they were nearly as fat.

Now, friends, the above article ought to answer the question, and it ought also to refute the statement that has been made several times in different periodicals, to the effect that sweet clover is of no value to farm stock, or that horses, sheep, and cattle would not eat it. The above explains quite fully why it is that farm stock will at first refuse to eat it. I feel confident that I can in a very little time teach horses, cattle, sheep, and pigs—yes, and poultry too—to eat sweet clover with avidity anywhere in the United States wherever sweet clover will grow.

## Temperance.

### THE ANTI-SALOON LEAGUE IN FLORIDA.

Our temperance meeting last Sunday evening was a "hummer." It was a union meeting of all the churches, and the house was crowded. I opened the meeting with a five-minutes' talk, and then Mr. Lambert, the State Superintendent of the Florida An-

ti-saloon League, spoke about 40 minutes. They are exceedingly fortunate in getting so bright and wideawake a man for the work. He got them so waked up that every man, woman, and child in the church rose up and voted against the saloon. He is a godly man, and at the same time fearless, and of remarkable ability. Florida will soon be all dry, if he keeps at it.

*Dear Friend Root:*—We are glad to welcome you back to Florida. I want to see you this time before you skip out. I suppose you will go to the fair at Tampa next month. Why not plan to be there at a certain time and give notice in GLEANINGS, as many of your friends would likely plan to meet you?

There is one phase of the question we temperance folks are ignoring. Man is a gregarious animal. You and I have our homes, friends, books, papers, a bright light, and a cheerful fire; but many men, and especially the tempted ones, have not these things, and the saloon offers companionship, light, warmth, and cheer, and do we wonder they fall in with it?

This wave of temperance in the South does not mean that drinking is at an end; but much of it is through fear of the darkie, and is to keep him from whisky. The gallons and gallons coming by express every day means some one is drinking a lot of rottenness. Well, come and see us, and bring Mrs. Root by all means. We shall be glad to meet her.

Bowling Green, Fla., Jan. 7.

IRVING KECK.

I have asked the fair commissioner to appoint a day for bee-keepers, and I will give due notice as soon as I hear from him, and arrange to be on hand. The Florida Anti-saloon League is already after the express companies, and I think something is going to happen soon.

### PARCELS POST, AGAIN.

WITH a few exceptions the entire agricultural press of the United States is a unit on the subject of parcels post. The editors seem to be well aware that the entire opposition to this great improvement originates with the express companies and their friends the railroads. Underneath all this opposition lies the idea that the farmer is a sort of hoosier, peon, or peasant, and that he ought to be very contented with things as they are. They forget he is the great wealth-producer of the nation, and that it is he who supplies most of the exports to pay our indebtedness to other countries. All other goods are a mere fraction of our exports of wheat, cotton, and other farm products. The farmer makes the millionaires.

There is a more important side to the controversy, which is seldom mentioned, namely, the propriety of improving the conditions of the farmer's life. Good roads, free mail delivery, telephones, and, finally, parcels post, would go a long way toward making life on a farm an ideal existence. Isolation is not good for any one—certainly not for the farmer's wife nor his children.

With central grammar schools it will soon come to pass that the farmer's children will get as good an education as the banker's child in the city. And why not? But the farmer will have to *fight* for these things.

W. K. M.

**FREE!****Comb  
Foundation****FREE!**

# Weed New-process Comb Foundation GIVEN AWAY!

A 2-lb. trial package included in every shipment of \$25 or over, simply for mentioning this advertisement.

We continue our special offer until Feb. 15.

Our factory is more complete than ever; and, having enlarged our business very much, buying every thing for cash, we are anxious to do twice the amount of business in the line of comb foundation that we ever did before. Our Weed New-process Comb Foundation is the best that money can buy; and whenever we succeed in placing some with a bee-keeper it means that bee-keeper's trade in the future. We also work wax into foundation by the pound at reasonable rates. Write us for rates, stating amount of wax you desire worked up.

With our very large and complete stock of The A. I. Root Co.'s make of bee-keepers' supplies in connection with our comb-foundation factory we are placed in position to offer you a special inducement to try our comb foundation, as we feel confident that you will use it all the time after you once try it.

## HERE IS OUR OFFER — GOOD UNTIL FEB. 15, 1908:

Any one who sends in an order for bee-supplies at the regular catalog price, with the cash to the amount of \$25 or more, will receive, **absolutely free of charge** with his shipment, 1 lb. of thin super foundation and 1 lb. of light brood foundation as samples. When sending in your order you must mention this advertisement in GLEANINGS to entitle you to the 2-lb. sample package of foundation.

Now, please understand your order must be for \$25 or more, and no shipment will be entitled to more than 2 lbs. of foundation—no matter how large the order may be. We are glad to give you a 2-lb package to convince a bee-keeper that our foundation made by the Weed New Process, out of our clear southern beeswax, is good foundation. We are doing this to enlarge our trade. We seldom lose any of our customers, as we know how to give the money's worth. We receive many complimentary letters from our customers, such as the following, unsolicited:

*Udo & Max Toepperwein:*—I got the bill of hives, and nearly all are made up. They are the finest hives I nearly ever saw. While we were waiting for the order my wife said: "Where did you order your hives from?" I said they were from The A. I. Root Co.; then she said, "Then we shall get some good hives, for they make the best hives we ever used." She always nails up the hives and frames, so she has a right to know about as much about the hive as I do. We have bought bee-supplies from several different factories, but A. I. Root makes the best goods of any of the factories that we have ever bought from. I have used foundation from several different factories and think your Weed New-process Comb Foundation as good as any I ever used. It is a great pleasure to deal with a firm that ships out the supplies as promptly as you do.

Taft, Texas, Dec. 22, 1907.

Yours very truly, S. M. CAMPBELL.

*Udo & Max Toepperwein:*—Are you still in the bee-supply business? If so, please send me one of your descriptive catalogs, as I want to buy all my supplies from you as long as you are in the bee-supply business.

Mineral, Texas, Dec. 23, 1907.

Very truly yours,

J. W. WOLFE.

## Let this Free Book tell you how to double your Potato Money

You can learn of the one way to plant your potatoes cheapest, how to save seed and soil, how to double the profit of every acre of your potato land.

You can get this book free for your name on a postal card. It will tell you all about the proper care of potato fields, proper methods of planting and cultivation, how to save hundreds of dollars in fertilizer money alone.

It will tell you how to do all this at a cost of but one dollar. It will describe the one planter that makes this all possible—the famous Acme Hand Planter. It will place in your hands all the great, vital truths of Potato Culture, condensed and plainly written, so it is easy to read and remember them.

You will want this book to put its precepts into practice on your own farm. Send for it now. Just say on a postal, "Send me your potato book."

# Paint Without Oil

**Remarkable Discovery that Cuts  
Down the Cost of Paint Seventy-  
five Per Cent.**

**A Free Trial Package is Mailed to Every  
One Who Writes.**

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdripaint. It comes in the form of a dry powder, and all that is required is cold water to make a paint weather-proof, fire-proof, and as durable as oil paint. It adheres to any surface, wood, stone, or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer, 202 North St., Adams, N. Y., and he will send you a free trial package, also color-card and full information showing you how you can save a good many dollars. Write to-day

R. H. SHUMWAY, Rockford, Illinois

NORTHROP, KING &amp; CO.

## STERLING SEEDS

Up in the Northwest is a firm, now 24 years in business, which sells good seeds. The Minneapolis Daily Times, Jan. 15, 1905, said editorially:

"It's not too much to say that through the new and improved varieties of seeds introduced by Northrup, King & Co. during the past twenty-one years, Millions of dollars have been added to the permanent value of Northwestern farm lands. Of such firms as Northrup, King & Co. it may truly be said, 'They deserve well of the state.'"  
(That's how we stand at home.)

## Our Minnesota Grown Grass, Field &amp; Clover Seeds

produce larger crops than seed from any other source. Our Sterling Brands represent the highest quality and purest seed obtainable anywhere—at any price. Samples on application. Large magnifying glass to determine quality, free to purchasers. See catalog, page 101.

## Vegetable &amp; Flower Seeds

We send free to buyers of \$1.00 worth of seeds from our catalog an extra dollar's worth of the varieties we consider to be the best of their class. See catalog, page 3.

## The Marvelous Perfume Plant

This is one of the most wonderful plants earth holds for our delight. It opens in the evening and exhales a delicious and far carrying fragrance—perfuming the whole garden. Easily grown in any climate and on any soil. For 10 cents we will mail a full size packet of seed of the perfume plant and

## Our 1908 Catalog

A seed catalog is a picture of the firm issuing it. Ours is factful, informing and straightforward. That's the kind of business we conduct. Write today and tell us your seed needs—we can supply them. Send for catalog anyway; it's free.

### Model Dollar Makers

No machines you can buy for your farm will earn as many dollars as

#### MODEL

### Incubators and Brooders

From its handsome, warmly padded case, and its perfect heating and ventilating systems, its accurate, powerful regulator, the Model Hatcher stands unequalled.

The Model Brooders, with their substantially made cases, their diffusive heating system that imparts a gentle warmth, together with copious ventilation, raise strong, healthy chicks.

Poultry is a profitable crop on farms where Model machines are used. If you are not making big money on your chickens, write me today for my book telling how you can. The Model equipment and methods assure success.

**A. H. REEVES & CO.,**  
411 Main St, Watertown, N. Y.  
Both Phones.

Clover seeds are advancing, and prices in our seed catalog no longer hold good. Write for prices if interested. If any one has alsike seed for sale send sample stating quantity and price.

### FLORIDA STATE FAIR.

The Florida State fair will be in progress from Feb. 5 to 22, at Tampa. Mr. A. I. Root expects to be in attendance on the 11th and 18th, and may be found at the Manatee Co. exhibit. He will be pleased to meet any bee-keepers, or readers of GLEANINGS, who may be there on those days.

### CARTONS FOR OUNCE CAKES OF BEESWAX.

We can supply cartons for one-ounce cakes of beeswax, printed with name and address blank, at 35 cts. per 100; 250 for 80 cts.; 500 for \$1.50; 1000 for \$2.75; by mail, 15 cts. per 100 extra. These prices will also include the large carton to contain 32 of the small ones. The complete package weighs 2 lbs., and, when filled, sells to the dealer at \$1.00. They retail the cakes at 5 cts. each. Retinned molds for molding ounce cakes cost 35 cts. per dozen; by mail, 40 cts.; for two-ounce cakes, 40 cts.; by mail, 50. We do not have cartons to fit the two-ounce cakes. To print your name and address on the cartons will add, 250 or less, 50 cts.; 500, 75 cts.; 1000, \$1.00.

### A BARGAIN IN DANZ. SUPERS AND SHIPPING-CASES.

We offer at a special bargain 190 Danzenbaker ten-frame supers, nailed and painted, filled with section-holders, Hyde-Scholl M fences, sections with full sheets of foundation. They have been used, but are nearly new and in good condition. Such supers new are listed in our catalog at \$1.75 each, yet we offer this lot crated and on board cars at Floresville, Texas, at 50 cts. each for the lot, and will throw in 1500 4x5 sections to make good any in the lot which may be broken or missing. In lots of not less than ten the price would be 60 cts. each; 50 at 55 cts. each as they are crated and loaded on cars. There are also 500 shipping-cases to hold 20 4x5 sections in the crates as shipped from the factory, which we would sell at \$5.00 per crate of 50, or \$9.00 per 100 for the lot. That is, \$140 cash for goods worth new at carload prices over \$340. This surely is a bargain for any one desiring to produce fancy comb honey with equipment that can not be excelled for the purpose. They are not in the right locality for comb-honey production, but should work excellently in some other location. Send your orders here to Medina.

### HOTBED SASH AND GLASS FOR THE SAME.

We have made an improvement in our hotbed sash by adding a round rod of hard wood through the center from side to side midway between the ends. Some bars are inclined to warp, making it more difficult to fit in the glass; also in lifting the sash by the side rail it may spring and loosen the glass. By the addition of the rod, with a nail driven through at each bar, after all are properly spaced, these objections are overcome. We are also making them standard width, 3 ft. 4 in. wide for four rows, 8-inch glass. We can also furnish them 3 ft. wide for three rows of 10-inch glass, or 3 ft. 6 in. for three rows of 12-inch glass on special order. As regularly furnished they are grooved for glass to be butted together, the joint to be closed with liquid putty. We also furnish them rabbeted so the glass may be lapped if so ordered.

Price of regular-size sash, 90 cts. each; \$4.25 for 5, or \$8.00 for 10, shipped in flat, not put together. If put together not painted, add 10 cts. each. If put together, painted two coats, add 30 cts. each; glazed with 8x10 glass, add \$1.00 for each sash at present price of glass. We can offer 8x10 glass at present for \$2.40 per box; 5 boxes at \$2.30; 10 boxes or more at \$2.20. This is a very low price, due to a recent cut in price of glass, and is not guaranteed for any length of time. If in need of sash or glass, send in your orders while the present low price holds good.

**WHILE BEE-KEEPING** is almost as old as creation itself, modern apiculture dates back hardly more than fifty years, and the period of greatest activity in the development of our present systems was twenty to thirty years ago. Many of the old writers of those most interesting days are still with us, and they will write special articles for the March number of

## *The American* **Bee-keeper**

(next month), which is to be an "Old Boys'" number; and the pictures of the writers will also appear in connection with what they have to say in their reminiscent letters. This number will contain forty pages, profusely illustrated and highly educational. **THE AMERICAN BEE-KEEPER** is in its 18th year. Subscription 50 cents per year, or three years for \$1.00 in advance.

***The American Bee-keeper, Falconer, N. Y.***

# DEEN LOOM

## Flying Shuttle

**W**HY not put your spare moments to work bringing in extra cash? Some people in your town are waiting for some one to make up their rags into carpets, rugs and portieres.

It's genteel, honest work that any man or woman can do and make good profit at it. Just to prove it, here are the names and addresses of fifteen out of hundreds of people who have woven carpets and rugs at a good profit. They use a Deen Loom.

### Good Profits Made At Home

- Mrs. C. R. Stover, Bradford, Ohio
- Oma Cooper, Dale, Indiana
- R. P. McGowan, Piedmont, W. Va.
- Mrs. Rob. Record, Seymour, Illinois
- Mrs. Henry Clark, St. Anthony, Iowa
- Mrs. A. L. Clark, Central Square, N. Y.
- Mrs. H. C. Blannet, New Lathrop, Mich.
- Mrs. T. E. Alley, Sylvan Grove, Kansas
- Mrs. O. E. Albin, Kearney, Nebraska
- Mrs. H. Goebel, West Point, Iowa
- Mrs. J. S. Gilbert, Milton Junction, Wis.
- Mrs. L. E. Foster, Bedford, Indiana
- Mrs. Salanda Gunkel, Osgood, Ohio
- Mrs. D. E. Williams, Pickering, Missouri
- M. H. Vining, Waterloo, Iowa

Remember these are only fifteen of scores and hundreds who at this moment are hustling out work and getting good money for it.

### You Who Read This

Haven't you often wished for a useful employment by which to make money in your spare hours? No doubt you know of people who would gladly pay you for weaving their rags into carpets and rugs.

It's not only the poorer people that have hand-woven carpets and rugs on their floors, but well-to-do people of city, village and country-side appreciate the handsome and useful products of home-weavers.

By canvassing among your friends you can work up a good business. Profitable, too. Besides, it's done at home with the children, where you can have an eye on everything in house and yard.

### It's Not Hard Work

Weaving with a Deen Loom is soon learned. The Loom itself is a simple affair, easily handled, and soon understood. May Vittum, Barclay, Kansas, says:

"I can weave almost twice as much as I could with the old loom. I would not go back to the old one for anything. The new one is faster, easier, and does the best work."

Having a steel frame well-braced, and rigid, it resists the shock and stroke of the shuttle mechanism, remaining solid for years without repairs.

It will accommodate any size rug or carpet demanded.

### What May Be Woven

Any design can be made in any number of colors that taste and fancy may dictate. You can weave rugs, hammocks, all kinds of hand-weaves, carpets, portieres, etc. The materials to use are common, carpet warp which can be purchased of any dry goods store; carpet rags, old clothes of any kind, old ingrain and brussels carpets, blankets, or nearly any kind of fabric. Your customers furnish you all material; you do the weaving and get good pay for it.

### A Few Prominent Reasons for Buying

- 1.—You can make from \$2 to \$3 a day if you weave 8 hours daily.
- 2.—You can make from \$4 to \$10 a week using only part of your time—say evenings after work and an hour in the morning.
- 3.—We help you personally by letter if you wish. But this is seldom necessary, because we send you simple, detailed instructions with pictures of the loom and its parts. This book makes everything plain. You have no real difficulty in handling the loom.
- 4.—The Fly-Shuttle is easily filled, quick to handle, doesn't bother.
- 5.—The Winding Mechanism and Feed-Governor are new improvements. The latter keeps the warp and weft mechanism within control. It saves much material and prevents hours of thrown-away time used by old-style looms.
- 6.—It takes up much less room than many other styles. It requires a room but 10 feet square for a complete weaving shop.
- 7.—We send you everything with the Loom. You can go right to weaving as soon as you get warp and rags.

### You Needn't Pay All At Once

Pay something down. As Loom brings in profits send balance by easy installments. Fill in the coupon and mail. We'll send our free catalog and a letter about our easy-pay plan.

# Cleanings in Bee Culture

Apiary of Jas. W. Bain, Marion, Ohio. Mr. Bain in the foreground.

*Published by* The A. I. Root Co., Medina, Ohio, U. S. A.

Entered at the Postoffice, Medina, Ohio, as Second-class Matter.

# \$500.00 ACCIDENT INSURANCE POLICY FREE!

## FARMERS' INSURANCE THAT REALLY INSURES.

You may have had other chances to buy accident insurance that would protect you in elevators, on steamboats, and automobiles, but this is the *first chance you have ever had* to get real protection in your ordinary work. This NEW \$500.00 POLICY was secured from the North American Accident Insurance Company, of Chicago, Ill., (Surplus \$331,498.66) the largest company in America handling this class of policies, after long negotiations. It took three months to induce the company to write the special features that were required to make it valuable for rural people. By buying the policies outright in very large quantities, it is now possible to offer it FREE with this remarkable practical combination of magazines.

GLEANINGS IN BEE CULTURE, \$1.00  
the bee-keepers' favorite paper.

FARM JOURNAL (five years), .75  
the Standard farm paper of the world.

GARDEN MAGAZINE—FARMING, 1.00  
a most beautiful, practical horticultural magazine.

INSURANCE POLICY . . . 1.00  
\$3.75

## All for \$2.

These magazines, if paid for separately, would cost you \$2.75, but we can sell ALL THREE MAGAZINES with the NEW INSURANCE POLICY for ONLY \$2.00. This is because the three publishers have combined for a subscription campaign. If each one sent you a separate letter it would cost us just three times as much as where we offer all three together. THE SAVING GOES TO YOU.

If the policy is not wanted we can substitute any of the following: "Designer," "Housekeeper," "Ladies' World," "McCall's Magazine," "Mother's Magazine," or the Garden and Farm Almanac.

## WHY SHOULD YOU HAVE THESE PAPERS?

**BECAUSE** GLEANINGS IN BEE CULTURE is the great paper in America devoted to bees and honey. If you have bees, or are going to get them (and everybody who lives in or near the country should have bees), you need the most reliable and latest information, and you want at the same time the simplest directions possible. You want the bee business in a nutshell, and that is what GLEANINGS will give you. For the beginner or the most expert it is equally valuable.

**BECAUSE** FARM JOURNAL is far and away the foremost farm-paper in the world, a boiled-down, practical, helpful, entertaining monthly, built to make the rural homes of America more happy, prosperous, and contented, and already doing it for more than 500,000 homes. For farmers, villagers, or suburbanites.

**BECAUSE** the most beautiful garden and horticultural publication in the world is the GARDEN MAGAZINE, full of sound sense, beautiful engravings from photographs, and fine printing. It has ten issues at 15 cents each and two at 25 cents each, per year, and the subscriber gets his money's worth twice over. It is a delightful magazine, useful, stimulating, and ornamental.

## WHY SHOULD YOU HAVE THIS INSURANCE?

Because you are in danger, every moment, of an accident which may cripple you for weeks, months, or for life; because the loss of an eye, a hand, or a foot, may mean destitution for yourself and your family; because this protection, for a full year costs you nothing whatever.

### WHAT THE POLICY PAYS:

|                                                                                                          |          |
|----------------------------------------------------------------------------------------------------------|----------|
| For Loss of Life.....                                                                                    | \$500.00 |
| For Loss of Both Eyes, meaning entire and permanent loss of the sight of both eyes.....                  | 500.00   |
| For Loss of Both Hands, by actual and complete severance at or above the wrist.....                      | 500.00   |
| For Loss of Both Feet, by actual and complete severance at or above the ankle.....                       | 500.00   |
| For Loss of One Hand and One Foot, by actual and complete severance at or above the wrist and ankle..... | 500.00   |
| For Loss of One Hand, by actual and complete severance at or above the wrist.....                        | 125.00   |
| For Loss of One Foot, by actual and complete severance at or above the ankle.....                        | 125.00   |
| For Loss of One Eye, meaning entire and permanent loss of the sight of one eye.....                      | 50.00    |

Provided such loss shall result within thirty days from date of accident, from accidental bodily injuries, solely and independently of all other causes, and covers accidents as follows:

Being thrown from a mower by horses.  
Being knocked down in the road by a wagon or automobile.  
Being hurt in a bicycle accident or collision.  
Being hurt while operating corn-sheller, fodder-cutter, etc.  
Being caught in a burning building, house, or barn.

Being hurt in an elevator or any public conveyance—train, trolley, boat, etc.  
Being injured in a runaway.  
Being frozen or frostbitten.  
Being injured by robbers or burglars.

Should the Assured obtain injuries in the manner specified above, which shall not prove fatal, but which shall immediately, continuously, and wholly disable and prevent the assured from performing each and every duty pertaining to any business or occupation, the Company will pay the Assured FIVE DOLLARS PER WEEK during the time of such disablement, but not exceeding six consecutive weeks for any one accident.

## NO DELAY OR EXAMINATION.

The insurance goes into effect as soon as you receive the policy and mail back the coupon attached to it. There are no dues, taxes, premiums, or assessments of any kind whatever to be paid by you. We have paid everything in full.

The three papers will begin at once, and will come to you each month till the time expires. THEN THEY WILL STOP, unless you order them renewed.

Send us \$2.00 by registered mail, or postoffice or express money-order-to-day. Money refunded to any dissatisfied subscriber. Address

GLEANINGS IN BEE CULTURE, MEDINA, O.

This Policy does not apply to persons under sixteen or over sixty-five years of age.

## Honey Markets.

### GRADING RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct, to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent) cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

**NEW YORK.**—There is but little demand for comb honey, and that for fancy grades only. While there is no overstock, there is a sufficient supply to meet all demands if not more. Off grades of white honey, dark and mixed are neglected, and very little called for. We quote fancy white, 15; No. 1 white, 14; off grades and dark, 10 to 12, according to quality. The demand is fair for nearly all grades of extracted; but receipts are quite large, and prices are somewhat declining. We quote: White sage, 8½ to 9; light amber, 7½ to 8; dark, 6½ to 7. The market for beeswax is quite dull; very little demand, but prices are declining. We quote from 25 to 30, according to quality.

HILDRETH & SEGELKEN,

Feb. 5. 265 Greenwich St., New York.

**ZANESVILLE.**—The market for honey continues to be light, though if any difference there is a slight improvement since our last report. Commission men seem to have plenty of comb in stock, especially alfalfa, and are getting from retail grocers \$4.00 to \$4.25 per case of 24 sections for honey, or 18 to 19 cents per pound. No. 1 brings about a cent less. The demand for extracted is chiefly in glass packages for the retail trade. I pack two sizes—25 and 10 cent, getting \$2.25 and 90 cts. per dozen, respectively, from grocery and drug trade. Beeswax is moving very slowly. We could use a little good yellow at 30 cts. f. o. b. here in exchange for bee-supplies.

EDMUND W. PEIRCE,

Feb. 5. 136 W. Main St., Zanesville, O.

**PHILADELPHIA.**—The honey market has been slow, both on extracted and comb honey. They are freely offered at the following prices: Fancy white comb, 15 to 16; No. 1, 14 to 15; amber, 12 to 14; extracted white, in cans, 8½ to 9; amber, 7 to 8. Beeswax, 30. We are producers of honey, and do not handle on commission.

W. A. SELSER,

Feb. 8. 10 Vine St., Philadelphia.

**INDIANAPOLIS.**—Demand for best grade of extracted honey is good, while comb honey is meeting with slow sales. Very little honey is being offered by producers, and jobbers are carrying a very limited stock. Bottled goods in groceries find slow sales, which can be attributed to dull times; but there is another reason—many bottlers are making the mistake of putting out inferior goods. Jobbers are offering the following prices, delivered here: No. 1 and fancy comb, 16 to 17; extracted white clover, 9 to 10; amber in barrels, slow at 6 to 6½. Beeswax, 28 cents cash or 30 cents in exchange for merchandise. WALTER S. POUDER,

Feb. 5. Indianapolis, Ind.

**SAN FRANCISCO.**—Practically all the last crop of honey has now moved out of the hands of producers, and stocks held here are slightly greater than last month. The supply, however, is still small, and prices are firmly held, though the movement has not increased to any extent. Water-white, comb, 16 to 17; white, 15; water-white, extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 6½ to 6¾. *Pacific Rural Press.*

Feb. 1.

**BUFFALO.**—Demand for all kinds of honey is fair at steady prices. No. 1 to fancy white comb, 16 to 17; No. 2 white comb, 13 to 15; No. 1 buckwheat, comb, 11 to 12½; No. 2 buckwheat, comb, 10 to 11; white clover, extracted, 9 to 11; amber, extracted, 8 to 8½; dark, extracted, 7 to 8; tumblers, 90 to \$1.00 per doz. Beeswax, 25 to 28. W. C. TOWNSEND,

Jan. 28. Buffalo, N. Y.

**CINCINNATI.**—The market on comb honey is exceedingly slow. Prices are no inducement to force sales. No. 1 white comb honey is selling slow, retail, 16. The market on extracted for manufacturing purposes is slow, ranging from 6 to 6½ in barrels. No white clover to offer. White sage is 9½ to 10. Beeswax, fair demand, selling at 32. C. H. W. WEBER,

Feb. 4. Cincinnati, O.

**HAVRE.**—There is only a small trade in foreign honey at about 5 cts. per lb. at the custom-house. Wax is selling at 33.

**NICE.**—Local honey is selling at 10 to 12; Riviera at 11 to 13 at the custom-house; Calabria honey (season of 1906), 11 to 12; from Sfax, Mahdia, Sousse, and Monastir, in Tunis, 10; second quality slightly less.

**MARSEILLES.**—Wax, Madagascar, 30; Algiers, 31; Morocco, 31½; local honey, white, 8; Italian, 8.

**BARCELONA.**—Wax, Spanish, 30 to 32; foreign, 30 to 33; native honey, 8 to 9 for first quality.

*L'Apiculture Nouvelle.*

**BERLIN.**—Honey is retailed here at 35 cts. per lb.

## THE BUSY BEE-MEN.

It won't be long before the bees

Will need some new abodes.

THE BUSY BEE-MEN sell THE HIVE

MUTH SPECIAL by the loads.

It can't be beat, and costs the same

As any 'in the ring.'

But take a look into our book—

You'll say, "That's JUST THE THING."

Send for our free catalog, and see our MUTH SPECIAL DOVETAILED HIVE illustrated. You can't believe it unless you see it.

of the different grades and kinds.

If you have any to dispose of, or if you  
intend to buy, correspond with us.

We are always in the market for WAX  
at highest market prices.

**HILDRETH & SEGELKEN,**

265-267 Greenwich St. 82-86 Murray St.  
**NEW YORK.**

**W. H. Laws says,** If there is a queen-  
breeder who can boast of better  
stock let him trot out the proof. Testimonials  
enough to fill this book. Will give you only one.  
Mr. J. C. King, Washington, D. C., writes, "For two  
years I have had one of your queens in my apiary.  
Each season she has given me over 200 lbs. comb  
honey; last season she actually stored while other  
colonies starved. I have over twenty strains in my  
three apiaries, but yours is the best."

Now is the time to get a fine breeding queen; stock  
up this fall and double your crop of honey the coming  
season. Single queen, \$1.00; 6 for \$5.00. Extra  
select breeders, \$5.00. Safe arrival and satisfaction  
guaranteed.

**W H LAWS, Beeville, Bee Co., Texas.**

Guaranteed to save 50 per cent in fuel, labor, time, and provisions. A whole meal cooked over one burner on any style stove. It assures you deliciously cooked hot meals; *30 days' trial.* No intermingling of odors or tastes. Fine for use in summer cottages. A necessity every day of the year. The only healthful way to cook foods and breadstuffs.

*Handsomely illustrated catalog free.*

**"O-HI-O" COOKER CO.**  
908 Jefferson Av., Toledo, O.

# THE RIPENED FRUIT

If you are not a subscriber to the *Bee-keepers' Review* then it is the

## Fault of the Advertising;

and I'll admit that no description of an object can quite equal an actual examination.

The *Review* started modestly, quietly put forth its roots, threw out its branches, budded and blossomed, and is now bearing

## Crops of Ripened Fruit.

This is not simply a fanciful figure of speech. There are reasons for this, which lack of space forbids mentioning; but it is an actual fact that the *Review* is going ahead and "doing things" in a way that really astonishes even its editor. Yes, and a competitor like Bro. Root, during a recent visit, generously admitted that the *Review* had never

## "Scintillated"

(yes, that's the word he used) as it had in the last few months.

Not as a publisher, but as one bee-keeper to another, I say you ought to take the *Review*. Of course it will do me some good, but it will do you *more*.

So sure am I that you would be delighted with the *Review* that I will make this proposition: Send me \$1.00 and I'll send you all of the back numbers from January, 1907, and put your name on the list for the rest of this year. When the back numbers come, take time to look them over carefully; and if you are not

## More Than Satisfied,

if you would not rather have the *Review* keep on coming to the end of the year, than to have the dollar, just drop me a postal and I'll take your name off the list, return the dollar, and you will be welcome to keep the back numbers. I could not make this offer if I did not know how good the *Review* really is—and I want you to know it.

**W. Z. HUTCHINSON, :: :: :: FLINT, MICH.**

We are not selling enough books. But WE HAVE TO SELL

## ALL THE BEE-BOOKS THAT ARE SOLD IN AMERICA,

and until March 1 we are Selling Them at 10 PER CENT DISCOUNT from Publishers' Prices.

And every book is perfect. We are *not offering you* seconds or injured books. Not only books, but new and renewal subscriptions to any of the bee-journals are subject to this discount. See what a saving that is. The A B C, the Root book on bees, is sold by other people for \$1.50 postpaid; by us for \$1.35. Twenty-five cents less by freight or express. Advanced Bee Culture, the finest written, the finest printed and bound, of any of the recent bee-books; the *best* book for one who is already a bee-keeper, is sold by others for \$1.00; by us for 99 cts. How to Keep Bees, by Anna B. Comstock, is the book for the suburbanite with a few colonies of bees who never expects to have a large apiary. Price the same as for Advanced Bee Culture. Either of these last books ten cents cheaper by freight or express. Because we are not selling as many of these books as we want to, we are *not only going to give* the discount above mentioned, but we will *send as a present* to the person from each State who is first to answer this advertisement with a book order any dollar bee-book in the English language which may be requested. REMEMBER, we can supply you with best quality of comb or extracted honey at fair prices, and fresh-from-the-factory ROOT BEE-SUPPLIES AT FACTORY PRICES.

**G. S. CRAFFAM & BRO.,**

**BANGOR, MAINE.**

### KNIVES AND SCISSORS.

If you are on the outlook for a really good pocket-knife we think that the pages of GLEANINGS will be of service to you in finding something durable and satisfactory. If you will turn to the advertisement of Maher & Grosh Co., A street, Toledo, Ohio, you will find advertised a line of cutlery goods. Do not think we advise without knowing the facts, for we sent to them for samples some time ago, and have been trying them right here in the office. The pocket-knife is just to our liking—sharp, well shaped, well bound, and yet not too heavy. We consider it a really good knife. The scissors we have are also satisfactory in every way—close-fitting and sharp. Moreover, we believe that both knife and scissors may be readily sharpened when required. We do not know for a certainty, but we believe the Maher & Grosh Co. would return the money to a dissatisfied customer who returned the goods, as they have been doing a mail-order business for years on the square-deal principle.

### FINE TOOLS FOR THE GARDENER.

In nothing is American mechanical skill more clearly shown than in the designing and construction of agricultural tools. Other countries are so hopelessly far behind that they can not be considered in the race at all. We do not here allude to horse-driven machinery, but rather to hand-power appliances for the gardener and truck-grower, such as is manufactured by the Bateman Mfg. Co., of Grenloch, N. J., who turn out in wholesale fashion an immense number of beautifully constructed gardening-tools. Some of these tools will actually do better work than any person can perform by hand. For example, no man could perform the marvelously accurate work done by one of their "Iron Age" machines for distributing garden seeds. In point of fact, the work of seed-planting is rendered a pleasure instead of a drudgery, as used to be the case in this country in years gone by. The modern truck-grower can not do without these tools. They are fixtures in his business, and he would stop work rather than attempt to do without them. If you are not acquainted with the superior merits of the "Iron Age" line of tools, write for catalog.

## Poultry Experts Show How to Make Money with Poultry and Incubators.

Every farmer and farmer's wife in this country should consider the great ready cash profits of raising poultry in the easiest and most economical, time-saving way, with incubators and brooders which have for 10 years demonstrated their superiority over the hen.

Poultry experts are absolutely agreed that the Cyphers Incubator Company's patented machines

are the world's standard. Beginners—Experts and the Agricultural Experiment Stations are using Cyphers machines successfully and recommend them.

It will pay every reader of this paper to get the latest reliable facts on the poultry subject, by writing for the Cyphers Free 212-Page Catalog (8x11 in., larger than a magazine), which is most interesting in the decision of the subject of "How to Make Money with Poultry and Incubators."

The catalog contains hundreds of illustrations, and describes the full line of Cyphers Supplies—everything for the poultry raiser. This, the biggest and best book of its kind, is free to you if you name this paper and send name and address of two acquaintances interested in poultry. Address

Cyphers Incubator Company, Buffalo, New York, Boston, Chicago, Kansas City, Oakland, Cal., or London.

## Poultry Magazine,

Monthly, 50 to 100 pages, its writers are the most successful Poultrymen and women in the United States. It is

### The POULTRY TRIBUNE,

nicely illustrated, brimful each month of information on How to Care for Fowls and Make the Most Money with them. In fact so good, you can't afford

to be without it. Price, 50 cents per year. Send at once for free sample and **SPECIAL OFFER TO YOU.**

## SWINE MAGAZINE

Monthly 24 to 64 pages, best writers and information how to **Make Big Money With Hogs.** It is

### The NATIONAL SWINE MAGAZINE

Printed on heavy paper, well illustrated with Prize Winning Animals, Houses, Fixtures, &c. 50 cts. per year. Our **Premium Proposition to Agents** on these two Magazines enables you to

get one or a pair or more of pure bred pedigreed pigs, 4 kinds, **absolutely FREE** or a big **Cash Commission** if you choose. Write me today for samples of the two papers and full particulars.

R. R. FISHER, Publisher, Box 50, Freeport, Ill.

## GREIDER'S FINE Poultry Catalogue

for 1908 is larger and better than ever. Tells all about pure-bred poultry and illustrates 60 varieties. Contains 10 beautiful chromos of leading breeds—pretty enough to frame. Tells of best Louse Killer, how to cure diseases, make money. Only 10c postpaid. Send to-day for a copy.

B. H. GREIDER, Rheims, Pa.

**MAKE MONEY IN POULTRY** Others do it. You can too. Our big book "Profitable Poultry" tells how. Describes largest successful poultry-farm. 45 varieties of beautiful, hardy, pure bred fowls. Quotes low prices on fowls, incubators, supplies etc. Sent for 4 cents. Berry's Poultry Farm, Box 253, Clarinda, Ia.

## Catalogs Received.

Park's Floral Guide, La Park, Pa. A small catalog, but very interesting to the amateur flower-fancier.

Crine's Seed Catalog. This is an excellent list of gardeners' and truck-growers' seeds. R. V. Crine, Morganville, Monmouth Co., N. J.

Crawford's Catalog of Strawberry-plants. This is the annual announcement of celebrated strawberry-growers, the M. Crawford Co., Cuyahoga Falls, O. Spring catalog of Kevitt's plant-farm, Athenia, N. J. Mainly devoted to strawberries. Well worth sending for by those interested.

Charles City Nursery and Orchard Co. A catalog of fruit-trees, etc.—an excellent catalog of trees adapted to the central West. Address, Charles City, Iowa.

Annual catalog of the Texas Seed and Floral Co., Dallas, Texas—seeds, garden, and poultry supplies. One of the most important catalogs issued in the Southwest.

Olds' Seed Catalog—all sorts of farm seeds. L. L. Olds Seed Co., Clinton, Wis. This is just the thing for farmers in the blizzard States and the Canadian Northwest.

Ratekin's Seed-book, issued by Ratekin's Seed-house, Shenandoah, Iowa. Farmers in the prairie States can not very well overlook Ratekin when ordering seeds.

Three catalogs of D. Hill, evergreen specialist, Dundee, Ill. Many of our readers do not realize the splendid work being done by Mr. Hill. Get his catalog and see for yourself.

The 24th Annual Catalog of Sterling Seeds, by Northrup, King & Co., seedsmen, Minneapolis, Minnesota. This is a fine catalog, which is fully equal to those turned out by any Eastern firm of seed-dealers.

The Storrs & Harrison Painesville Nurseries, Painesville, Ohio. A full general catalog of seeds, rose-bushes, plants, ornamentals, and fruit-trees. This firm is one of the most reliable and satisfactory in the country.

Alineer Bros., Rockford, Ill.; general seed catalog. A good list for those living in central States.

Andorra Nurseries, Chestnut Hill, Philadelphia, Pa.; price list of trees, shrubs, roses, and fruit-trees. One of the finest catalogs of trees issued anywhere.

Carl Sonderegger, Beatrice, Neb.; catalog of the German nurseries and seed-house. All farmers in the Northwest should possess themselves of a copy.

Burpee's Farm Annual for 1908; general catalog of farm and garden seeds. No market-gardener should overlook sending for this fine catalog.

James J. H. Gregory & Son, Marblehead, Mass.; vegetable and flower seeds for 1908. Always to the front with fine pumpkin, squash, melon, and cucumber seeds.

C. C. Abel & Co., 116 Broad St., New York; trade catalog of nursery trees; Pierre Seibre & Son, Ussy, France. Very interesting to those who grow trees for sale.

Geraniums. R. Vincent, Jr., & Son Co., White Marsh, Md., beautiful catalog devoted to geraniums only. If you are a lover of these flowers, this list will interest you.

Seed Catalog of N. L. Willet Seed Co., Augusta, Ga. This is a very complete list of seeds adapted to Southern conditions. Many of the items are not listed by Northern seedsmen.

Everything for the Garden. A very handsome catalog issued by Peter Henderson & Co., 35 Cortlandt St., New York. The Henderson catalog always confers a luster on a great name.

Maule's Seed-book. A large catalog of seeds by Wm. Henry Maule, Philadelphia, Pa. This firm has always provided a large and handsome catalog to its patrons, and this year is no exception.

Vaughan's Seed-store Catalog, of 84 and 86 Randolph St., Chicago, Ill. This is a large catalog from one of the world's most extensive seedsmen—a very complete list for farmers and gardeners.

Stokes' Standard Seeds. This is the full title of the annual catalog of Walter P. Stokes, 219 Market St., Philadelphia, whose name is familiar to all market-gardeners and florists in the Eastern, Central, and Southern States.

## MR. ROBEY'S STATEMENT.

When you wish to get the best results from every dollar you invest in advertising your goods whether it is bees, queens, bee-keepers' supplies, honey, or any class of merchandise, you want exclusive evidence that the paper selected has been no disappointment to those who have tried it for a long time.

Mr. L. H. Robey, Worthington, W. Va., is one of the older advertisers in GLEANINGS, having begun about fifteen years ago. In July, 1903, he said: "I have been breeding Italian queens about twelve years, depending almost solely on GLEANINGS to bring me trade, and for the past three seasons I have been flooded with orders continually and have had to return hundreds that I could not fill." Mr. Robey would not have secured and held such patronage if he did not furnish good queens and give prompt service to the readers of GLEANINGS, neither could he secure such large orders were it not that our readers have such implicit confidence in the advertising admitted to our columns. We take pleasure in submitting the following letter from Mr. Robey:

*Worthington West, Va. Sept 19 - 1907*  
*AJ Root Co*

*Answering your letter enclosed here in will say Gleanings has never disappointed me unless it was in bringing me more orders than I expected and could fill. For the last 6 or more years I have been unable to supply the demand made on me for Queens. Part of the time this season I was over two hundred Queens behind on cash orders and at this time I am just 70 Queens behind. Any Queens breeder who will do his part will find Gleanings will do its part every time. I am as well satisfied with the returns from my ad in Gleanings as a man could be. Gleanings is a clean bright up to date Journal long may she live*  
*Most truly*

*P.S. I use no other paper* *L. H. Robey.*  
*but Gleanings in advertising my business*  
*L H R*

If you haven't already placed your order for advertising space, you should do so at once, stating the approximate date when you want it to begin. Early orders secure select positions. Any information given by addressing

**ADVERTISING DEPT. GLEANINGS IN BEE CULTURE, MEDINA, O.**

# OUR 1908 CATALOG

is ready for mailing. We should like to send YOU a copy. It gives prices and description of "ROOT-QUALITY" bee-supplies. These are the goods that thousands of SUCCESSFUL bee-keepers are using. We are the "ROOT-QUALITY" HEADQUARTERS in MICHIGAN. We save you time and freight expense.

On the back outside cover page of our new catalog we make a special offer on GLEANINGS to both new and old subscribers. If you renew soon or wish to subscribe, let us know.

By the way, did you notice the list of goods that we are offering at a SPECIAL rate in Jan. 15 Gleanings? Look it up.

## M. H. HUNT & SON, Redford, Mich.

### TO THE BEE - KEEPERS OF CANADA.

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the QUALITY. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, The best is cheapest."

**E. GRAINGER & COMPANY,**  
Deer Park,  
Toronto, Ontario, Canada.

## IN BEE-KEEPING

The man who makes a \$ucce\$\$ in bee-keeping is the one who does things when they should be done.

The time to buy goods is before they are needed; not when the rush comes.

Let us send you our catalog for 1908, so you can make out an order now.

**THE A. I. ROOT COMPANY**  
SYRACUSE, :: :: :: NEW YORK

## WE DO NOT SELL ROOT'S SUPPLIES

So many advertisers in GLEANINGS IN BEE CULTURE sell supplies bought from the Root Co. that to explain away a false impression we are compelled to state that we are not jobbers, but *manufacturers*. We make all the Bee-supplies we sell. Minneapolis is the largest lumber-distributing point in America. We buy lumber to advantage; we manufacture by water-power; we have lowest freight rates, and we sell on manufacturer's profit basis. **Let us quote you prices.**

**MINNESOTA BEE-KEEPERS' SUPPLY COMPANY**  
DEPT. 22 .. .. . MINNEAPOLIS, MINN.

## THE DANZENBAKER SMOKER

PAT. OCT. 3, '06, JUNE 4, '07

### GOLD MEDALS

St. Louis Exposition, 1904  
Jamestown Exposition, 1907

IS THE BEST,  
STRONGEST,  
COOLEST,  
CLEANEST,  
CHEAPEST,  
AND LARGEST  
SMOKER SOLD  
FOR A DOLLAR

The perforated side grate seen above holds a removable, metal, asbestos-backed fire shell, preventing burning the tin off the outer case, and deflects the air at right angles, preventing back draft to the valveless bellows. The air, passing to the back and over the top, cools and expels the smoke, fanning the burning fuel at top or side till all consumed, giving cool smoke for hours from one filling. It can't clog. No top-heavy cap to choke with soot; no valve to fail; no holes shedding sparks or hot ashes.

Four years' sales prove its success beyond a doubt, expensive dies making it uniformly perfect as possible to devise. We confidently guarantee full satisfaction or refund the price.

Price, \$1.00; 3 for \$2.50; by mail, add 25c. each

Send address of yourself and Bee friends for 8-page leaflet on "Smoker," and facts about Bees and Queens, 80 pages, free.

**F. DANZENBAKER, Norfolk, Va.**

## TEXAS SEED AND FLORAL COMPANY

Dallas, : : . Texas

## HAVE YOUR HIDES

## MADE INTO FURS FOR THE WHOLE FAMILY

Don't sell your hides—it's poor economy. Send them to us and have them made into Fur Coats, Robes, Mittens, etc., and keep your whole family warm this winter. Any color horse or cow hide looks well. Our process makes them soft and pliable, as well as moth-proof and water-proof.

No matter where you live we will pay the freight on all Hides sent to us to be made into Coats and Robes.

We guarantee complete satisfaction with all our work. Don't send your hides to inexperienced tanners and be disappointed. We are the largest firm in the country that tans, manufactures and sells direct to the consumer. We are equipped in all departments to do first-class work. We'll make you a robe from your hide, lined with best plush, for from \$7.00 up; a coat made to your measure, lined and trimmed in splendid style, for from \$9.50 up. With every coat or robe we make we furnish free a fine pair of Fur Mittens, with horse-hide palms. One large hide or two small ones makes a coat like one shown here. We also make long or short coats for ladies and for girls and boys. Calf, goat, dog and colt skins make elegant Floor Rugs, and Gauntlet Gloves and Mittens. We tan any kind of skins, wild or domestic, and make them into furs to order. Our prices are reasonable, while the quality of our work is of the highest order. Write us before you sell a single hide; ask for our 40-page catalog giving full particulars and showing our full line of fur goods. Write today.

**National Fur and Tanning Co.,**

**FOURTH "—5 lbs. Comb Fdn.**

**FIFTH PRIZE—5 lbs. Comb Fdn.**

THE ABOVE PRIZES will be given absolutely free to those who will make the largest number of words out of the letters found in the name "Toepperwein." The letters may be used over as many times as desired, but in no single word oftener than found in the name "Toepperwein." Only words found in Webster's dictionary are admitted. The words must all be plainly written in columns, and numbered.

This contest is absolutely free to any one and anywhere. It is a fair contest, and one has the same chance as the other. These contests are very instructive, and just the thing for schoolchildren to pass the evenings. The contest will close May 1, 1908, and all lists with words must then be in, and in May 15th GLEANINGS the results will be published, giving the names of the winners and all the words of the one who wins the first prize. The winners have the privilege of choosing any grade of foundation. We feel confident that the winners will be highly pleased with the prizes, as the comb foundation is as fine and perfect as any machinery can make, and is made right here in our factory out of this clear Southern beeswax.

Now do not lay this aside and put it off until some other time, but begin right now and start the list. Write the words in a little memorandum-book and carry it in your pocket; and every time you think of another word mark it down. There are a great many words to be made out of the name "Toepperwein," and you have just as good a chance as any one else: so do not let any time go by, thinking some one else may have more words. Now, understand you are welcome to enter this contest, no matter whether you own bees or not, nor whether you are old or young, nor where you live. In case any of the winners have even numbers, then the amounts will be equally divided between such winners.

## ROOT'S BEE-SUPPLIES.

We always carry a large and complete stock of The A. I. Root Co.'s make of bee-supplies at Root's factory prices. Write us for illustrated catalog and price list.

## HONEY AND BEESWAX.

We buy honey and beeswax at all times. If you have any to offer, write us stating quantity you have, quality, and your best price delivered at San Antonio. We also work beeswax into comb foundation by the pound at reasonable rates. We should like to have some business from associations in other States who have large quantities to work up. Our capacity is 500 lbs. per day.

We have just received a set of new machinery, and our *Weed New Process Foundation* is perfect and gives perfect satisfaction everywhere.

Whenever you are in San Antonio make our office your headquarters and let us show you through our plant. Stay here a while and meet the bee-keepers as they come in. You are always welcome and will be courteously treated.

**UDO & MAX TOEPPERWEIN,**  
1322 South Flores St. SAN ANTONIO, TEXAS.

**"If goods are wanted quick, send to Pouder."**  
**Established 1889.**

## The Bustling Busy Buzzing Bee.

*By the Bee Crank.*

"For where's the State beneath the firmament,  
 That doth excell the bees for government?"

So wrote Du Bartas more than 300 years ago, and men are still learning from their miniature teachers. Before you can say "scat," the bee will begin to get busy foraging for you in sublime but, alas! often misplaced confidence because you are not fully prepared to furnish the bees with proper facilities. Order your supplies to-day. I am ready. I haven't a shopworn article in my house. My patrons do not give me a chance to accumulate dead stock. I am still making a

specialty of quick shipments; and Indianapolis is so located that they go direct. It's a main line from me to you, regardless of distance. I have comb foundation ready for immediate shipments in exchange for beeswax, on which I allow you

30 cents per pound in trade. I have a big lot of bright new Danzenbaker hives and a complete line of Root's goods at Root's prices. All of them and many other bee requisites are shown in my new 1908 catalog, free for the asking.

*Walter S. Pouder, Indianapolis, Ind.*

Goods, ordered of you recently, arrived in first-class shape and very promptly. I have frequently had to wait over a month for goods ordered only a couple hundred miles from here. Many thanks for your promptness, and I, too, know where to send when in need of more goods.

*Macon, Ga., Feb. 3, 1908.*

Respectfully, F. C. RIES, Jr.

**513-515 Massachusetts Avenue, Indianapolis, Ind.**

# GLEANINGS IN BEE CULTURE

Published by The A. I. Root Company, Medina, Ohio

E. R. ROOT, EDITOR  
H. H. ROOT, ASST. ED.

A. L. BOYDEN, ADVERTISING MGR.  
J. T. CALVERT, BUSINESS MGR.  
A. I. ROOT, EDITOR OF HOME DEPARTMENT

Vol. XXXVI.

FEBRUARY 15, 1908.

No. 4

IF JAY and the "other" two dogs experiment any more as on page 145, please print conclusions only in copy of GLEANINGS sent to me. Circumstantial details are too hard on suspender buttons "in this locality."

ONE OF THE weakest points in the production of comb honey in Quebec has been the production of combs attached only to the bottom and sides of the sections, p. 153. How under the sun do they keep the bees from attaching them at the top?

THE EDITOR of *Canadian Bee Journal* having objected that comb honey was unwholesome because the wax had to be melted in the stomach, D. Anguish comes at him in this wise: "For my part, I think that is where the unhealthy part comes in with your customers—heating them up so hot as to melt the wax."

A PAIR OF FOWLS valued at \$2000 were on exhibition at the Chicago show. An ordinary queen bee sells for about the same as a pair of ordinary fowls. If a queen of great value were rated at \$2000 the idea would be hooted. But why should there not be the same difference between the common and the best in bees as in fowls?

G. M. DOOLITTLE, p. 143, grudgingly admits that drones help keep up heat in a hive from which a swarm has issued, when the workers are few. Friend Doolittle, wouldn't drones help just as much to keep up the heat "when the workers are few" in a weak colony in the spring, or at any other time? Oh! "workers are better for that," are they? Then why not after swarming?

AS POSTSCRIPT to hot-air liquefying, p. 145, which I suppose is valuable because of its slowness, let me advise those with only a

small quantity to liquefy, to set it on the reservoir of the cook-stove, where it may take three or four days to liquefy, but can never be overheated. [Yes, the reservoir on the back of the stove is the handiest place; but, unfortunately, only a very small quantity of honey can be reliquefied there.—ED.]

"LABELING THE WEIGHT," p. 141. Does that Nebraska law really demand putting the weight on a section of honey? Does it not refer to packages already put up? If a grocer weighs a pound of coffee, and wraps it up, is he obliged to label it? Does a section of honey come under the head of "package of food," if not previously wrapped up? [We do not see any thing in the exact wording of the law, page 141, that warrants your conclusion. When the law is not specific it is wise to err on the safe side.—ED.]

WHAT GOOD REASON is there for having more than  $\frac{1}{4}$  in. space between bottom-bars? [We suppose you mean  $\frac{1}{4}$  inch on a vertical line between the bottom-bars. Such close spacing would be decidedly objectionable if used in sectional hives; for it is desirable to have bottom-bars narrow enough so that one can look up between the combs when the brood-chamber is lifted up. With wide bottom-bars leaving only  $\frac{1}{4}$ -inch space it would be difficult to arrive at any conclusion as to the condition of that particular sectional brood-nest.—ED.]

"WITH THE SYSTEM of lifting up the partly full super and placing the empty one under, one has to be very careful or too much room will be given. In this case the sections will be light weight, and poorly attached to the wood, so they will not stand shipment as they should," *Review*, 13. Before using bottom-starters I had trouble with sections that would not stand shipment; with bottom-starters I can not see how such a thing is possible. One of the first things the bees do is to fasten the two starters together, and, so far as concerns the comb breaking out of the sections, they would ship in perfect safety when less than half filled.

C. P. DADANT, *American Bee Journal*, 15, objects to the attempt to have two queens working in a hive, risking the life of one or

both, and says the only time to make it profitable would be early in the season so as to have a strong force for the harvest. But, friend Dadant, why didn't you go a step further? Early in the season no more brood can be matured than the bees can cover, and at that time there are generally not enough bees to take care of all the eggs one queen can lay; so if ten queens were added how could it increase the force of bees? I have never taken any stock in doubling queens to get strong colonies, but counted it a big thing if we could thus winter extra queens and prevent swarming. If these things fail us we can only sigh over blighted hopes, and start looking for some other thing new and good.

G. M. DOOLITTLE, page 23, says buds for basswood blossoms are formed in June and July in the preceding year, and that we can distinguish these blossom-buds in May; and H. S. Wheeler wants to know if I have found it so, and if the same thing is true as to the grape. I never watched the grape very closely, so I can not say about that, and I do not know exactly how long before blooming I have recognized basswood-buds; but I am quite familiar with blossom-buds on fruit-trees, and can go out any time in the winter and show you the blossom-buds of apple, pear, plum, or cherry. So characteristic are the blossom-buds on apple-trees that I can tell quite often by the look of a bud in January whether it was taken from a Dutchess tree, a Talman Sweet, or some other variety with which I am acquainted. Blossom-buds on cherry-trees are *easily* distinguishable before the leaves fall the preceding summer.

PROHIBITION, nowadays, is all the while cropping out in new places and in new ways. The great mail-order house of Sears, Roebuck & Co., Chicago, handed each of its employees a circular, saying, "Entering any saloon within a certain proscribed district at any hour of the 24 hours of the day is absolutely prohibited. This district is bounded by Jackson Boulevard, West 40th St., 16th St., and California Ave. This prohibition went into effect April 1, 1906, and employees discovered in saloons in that district will have placed themselves in a position where their services are no longer desirable." The general manager says, Jan. 21, 1908, "This attitude we still rigidly maintain, and we feel that the policy has worked great benefit to our institution as well as to the employees themselves." [The action of the railroad companies and other industrial concerns along the same line only goes to show that the liquor-traffic has got to step down and out very soon.—ED.]

MR. EDITOR, you say, p. 140, that if supers with the Miller escape are piled distant from hives you don't see how it is possible for young bees to get back to their hives; but if placed near the entrance they might crawl in. Why, man alive, they fly—why shouldn't they? I suspect you have in mind that some are so young that they have not yet flown, and so do not know the way home. I won-

der if bees ever leave the brood-combs before their first flight; at any rate, in the hundreds of times we have used Miller escapes I have yet to see the bee so young that it didn't come out and fly away—somewhere. Don't you think it would go to its own hive? Even if it should go to some other hive, what harm? [This whole question hinges on whether young bees leave the brood-combs before they can fly. We would have said that they would, but possibly we are mistaken. If so, we stand corrected. We shall be glad to get expressions from our subscribers on this point—that is, if a pile of supers containing bees, just as they come from the hive, be placed at some point remote from any colony, do all the bees, old and young alike, after passing the escape, go back to their respective hives? or will some of the young bees be lost? It is our impression that, some years ago, when we tried this Miller bee-escape on a pile of supers, there was a lot of young bees clustered around the outside of the pile; and that is why we have always supposed that a bee-escape so placed as to deliver the bees back into the brood-nest whence they came was better than one that delivered them out in the open air.—ED.]

THAT SECTION STRAW, p. 140, looks as if it were footnoted by the Artful Dodger. My five or six questions are utterly ignored, and some talk given that doesn't bear any too much upon the subject. Please go into your secret chamber, Mr. Editor, taking your conscience with you, and answer to yourself the questions I asked, and see if you don't think it better to call a story a story, and not a section. You think the phrase "sectional hive" would not be misunderstood "unless one is woefully ignorant of apicultural terms." Neither do I, for "sectional" has not been in use with regard to sections. But "section"—and that's the word we were talking about—might be misunderstood if used in the two ways. Only this morning I happened upon it in reading, where it was hard to decide which meaning it had; and I am not so "woefully ignorant" as I might be, either. [You have apparently jumped to the conclusion that the editor was arguing against you, when, as a matter of fact, he *thought* he was helping to establish your position, in part. Read the footnote over again and see if you do not come to that conclusion. The footnote in question was based, not on your particular statement, but on all the discussion that had been going on, concerning which your last statement was the "last straw."]

We did not say that we sanctioned "section" as referring to a shallow brood-chamber. If our space had not been limited we would have (and hereby do now) tabooed that word in that connection, and shall endeavor hereafter to cross it out when it is used by a correspondent. We are of the opinion that we nearly if not quite agree; but we see no need of coining new terms for "sectional hives," "divisible brood-chambers," "stories," etc., as urged by some.—ED.]

MARYLAND has no pure-food law. The *State Agricultural College Quarterly* says it is time it had one. It is. The bee-keepers will have to stir them, probably, before the law-makers will do any thing.

WINTER is starting out on the first of February snug and cold. We much prefer to have it cold at the right season of the year in order that we may have other seasonable weather in its season. A cold February and March is quite sure to be followed by a mild and early spring; but a warm February and March will be almost sure to be followed by a bad April or May. Nature seems to try to establish a balance of weather.

#### HIGH EXPRESS RATES.

THE railroads have steadily reduced their rates for a number of years; but the only move made by the express companies in 18 years has been to raise them, which they did when the United States levied special taxes on account of the Spanish war. They raised their rates to meet these taxes. The taxes have been long since removed, but the rates have not been reduced in the least as they ought to have been. W. K. M.

#### THE BAR SINISTER.

ACCORDING to press dispatches from the seat of government, President Roosevelt is very much interested in the controversy with regard to corn syrup vs glucose. One reason for this is because the business of manufacturing glucose is supposed to be in the hands of a trust. Another reason, so it is said, is the fact that the Standard Oil Co. is financially interested in the company controlling the output of glucose. W. K. M.

#### SPECIAL ARTICLES IN THIS ISSUE.

THERE are several articles in this issue to which we wish to call special attention. One is a contribution on sweet clover, by Frank Coverdale; another, on the folly of using swarming-cells, by E. W. Alexander; another, on home-made windmills, by T. P. Robinson; and, last, the automatic uncapping-box, by L. E. Mercer, a device by which cappings are melted as fast as they are shaved off the combs. There are other valuable contributions in this issue, all deserving a careful reading.

#### ITALIAN BEES FOR JAPAN.

F. JAY LEWIS & SON, of Oak Park, Cal., recently sent two full colonies of Italian bees to Japan, and, according to advices

since received, the shipment was entirely successful. It may be asked why it was necessary to send full colonies. The reason is obvious when we remember that the bees of Japan are smaller than ours, and therefore the comb cells are too small to raise our bees in to maturity. Mr. Y. Suminokuru, Tokio, Japan, is now the owner of the two colonies so successfully transported.

W. K. M.

#### WAX-MOTHS AND AMERICAN FOUL BROOD.

THE above is the title of a small bulletin issued by the United States Department of Agriculture. As its name indicates, it deals with the relation of the wax-moth to the spread of foul brood. The author, Dr. E. F. Phillips, comes to the conclusion the wax-moth does not prevent the spread of foul brood when it eats up the combs, as the bacteria are still present. There are three plate illustrations. The Superintendent of Documents, Government Printing Office, will supply copies at 5 cts. each. W. K. M.

#### CATTLE AND SHEEP VS. BEES.

THE western sheep and cattle men, at least a great many of them, are protesting against the passage of the Burkett bill now before Congress, providing for the leasing of all public grazing lands. So far as bee-keepers are concerned, however, the case is different, because it would provide against overstocking a location with bees. Also two of the worst enemies of the bee business would be controlled namely, sheep and goats, which are likely in the end to eat up every flowering tree and shrub on the face of the landscape. This has actually happened in certain localities where the range has been overstocked with sheep, cattle, and goats. The prime objects of the Burkett bill are to provide against overstocking, and against the cattlemen's and sheep-herders' wars.

W. K. M.

#### FIVE THOUSAND BASSWOOD SEEDLINGS AT AU SABLE, MICH.

THE following clipping has been sent us, and will explain itself:

BAY CITY, Mich., Dec. 17.—Wm. B. Mershon, speaking of the work along forestry lines being done on the Au Sable forestry farm, said: "We have just contracted with the forestry nursery at Dundee, Ill., for 5000 basswood seedlings. These are two years old, and they will be put out as soon as the weather is favorable in the spring. It is an interesting fact to note, that basswood seeds do not germinate the first year of planting, but germinate in the second to the fifth year."

Basswood is now extensively used for packing-boxes, etc. A few years ago it was not used for such purposes; but it has been found to be an excellent substitute for pine, formerly so largely used in that way.

If this plan were to be carried out by other States it would go a long way toward solving our section problem for the future, and at the same time give us the old-fashioned flows of honey from basswood. Of course, it would take years to get results; but it is high time that we were beginning to do something, for the paper and furniture industries alone are cutting annually

enormous quantities of this valuable timber; and unless some effort is made to replace it, coming generations will suffer hardship.

#### SWEET CLOVER AS A FORAGE-PLANT FOR CATTLE.

ON p. 147 of this issue will be found some very valuable and interesting testimony showing how cattle, *when once educated to it*, will actually ignore timothy and alsike clover—two of the supposedly best forage-plants in the world, and eat sweet clover clean down to the ground. All the more surprising it is that so many State legislatures have declared that sweet clover is a noxious weed, and that, therefore, the road supervisors must keep up an unremitting warfare against it. We hope our readers will seek the ears of their Senators and Representatives, and ask to have the law against noxious weeds amended, eliminating sweet clover from the list.

#### A NEGLECTED FIELD.

THERE is a demand for a method of serving small portions of comb honey at hotels and on dining-cars, without drip or the messing of dishes. Quartering up a section of honey is not entirely satisfactory unless four people are served at one time. What is wanted is a plan for cutting up a sealed comb in an extracting-frame into small portions, washing off the drip and wrapping in waxed or paraffine papers. The problem is, how to do this without too great an expenditure of labor, and yet at the same time have something that is neat and attractive. If this can be done in a manner satisfactory to the hotels, restaurants, and dining-car people, a big demand for honey at good prices will be assured. We should be glad to hear from any one who knows how to meet the requirements.

#### BEEES AND RHEUMATISM.

WE notice in the *Youth's Companion* for Feb. 6 that "Dr. Ainley Walker, of University College, Oxford, England, has undertaken to solve the question whether, as popular belief in many countries has long asserted, the poison of bees' stings acts as a prophylactic and a cure in case of rheumatism. As he has recently been able to collect some definite evidence in support of this belief he invites correspondence from all persons having personal knowledge of the subject. Among other facts which he believes to be established is a connection between rheumatic fever and the production of formic acid (the acid of bee poison) in the human body." We hope bee-keepers in a position to give evidence will be kind enough to write Dr. Walker, stating the facts.

W. K. M.

#### MORE ROMANCE.

MÆTERLINCK has written a book entitled "The Intelligence of Flowers," "which," *The Independent* says, "is, like 'The Life of the Bee,' a unique combination of fact and

fancy, scientific in its statements, humanistic in its interpretation of them, mystical in its philosophy, and poetical in its expression." Our contemporary hits the nail on the head. The features which it characterizes so well are calculated to make any book sell, and in this respect Maurice Maeterlinck is one of the greatest writers of this or any age. No doubt "The Intelligence of Flowers" will be as popular as any of his previous works; but it is a peculiar commentary on our civilization that a book which is not true is far more popular than a strictly truthful one. Some allowance must be made for the fact that the elegance of diction and beautiful ideas are worth something, and in this the great Belgian certainly excels.

W. K. M.

#### VERY LITTLE ADULTERATION.

THE annual report of the Connecticut Experiment Station relating to the analysis of food products has this to say on the subject of honey adulteration:

Formerly strained honey was extensively adulterated with glucose, and to some extent with cane sugar. It was also a common practice to feed bees with sugar, which yielded, when stored in the comb, an inferior and flavorless product. At the present time these frauds are not so commonly practiced.

During the present year 45 samples of strained honey were bought and examined, of which only one was adulterated. A description of the adulterated sample follows:

17997. Label: "Hallett Table Water Co., Bridgeport, Conn. Nonquit Pure Honey. Superior quality. Sparkling, delicious." Dealer: S. Manjoney, 1362 Main St., Bridgeport. Per bottle, 15 cents. Adulterated with glucose.

It seems to us this is a very satisfactory report from the land of wooden nutmegs, and yet it is our opinion that other States can make a showing equally good. Honey adulteration has practically ceased, and consumers are well protected against fraudulent honey. One case in forty-five is a small percentage, and probably that was bottled before the national pure-food law went into effect.

W. K. M.

#### TOO MUCH BOTTOM VENTILATION IN CELLAR DETRIMENTAL.

It will be remembered that we had last year a large amount of bottom ventilation for our cellar-wintered colonies. Even before the first of the year they were wintering very badly, and before the time of setting them out we had lost nearly 90 per cent, as we afterward learned. This year, in the same cellar, under the same conditions, we put in another lot of bees of about the same strength, but with a narrow contracted entrance,  $\frac{1}{8}$  X 8 inches—just the same the bees were having in the late fall outdoors, and, presto! what a change! They are wintering finely.

Last winter, when we lost such a heavy percentage of our bees, there was one colony that, by mistake, was shut up tight during almost all the winter, and it wintered the best of any colony in the cellar. This we considered to be a "pointer" showing that too much ventilation, in some cases at least, is decidedly bad.

With small entrances we have had ideal wintering in our bee-cellar; but when, last year, we gave a large amount of ventilating space under the hives, something "happened." We are not positive, of course; but it looks very much as if too much ventilation for indoor-wintered bees was bad. It seems reasonable that a colony of bees should have a warm hive, even in the cellar. If a third of the bottom is open to cellar air, then they must consume too largely of their stores in order to keep up animal heat. This results in the clogging of the intestines, and then dysentery. If there is a furnace in the cellar this large amount of ventilation would do no harm, because the atmosphere would be reasonably dry and fairly warm.

#### HONEY AS AN ARTICLE OF FOOD AT OUR LEADING HOTELS.

THE editor has been making numerous trips in various directions over the State of Ohio, and he has been gratified to see that honey and maple syrup are now being placed side by side as two standard delicacies and desserts at our leading hotels. The day was when honey was never mentioned; but since the advent of national and State laws the inferior and spurious sweets have been so thoroughly tabooed that the leading hotels do not care to recognize them. They take pride in offering only the best in the line.

We wish to offer a suggestion right here to our readers; and that is, that they see to it that the leading hotels in their vicinity are supplied with a first-class article of honey. Do not let them go to the local retailers and get an inferior product.

Traveling men are great advertising mediums. Supply them with good honey, and the demand for the article will increase enormously, as they will introduce it in their homes and talk about it to their patrons.

Our own local hotel-keeper of the American House finds an increasing demand for honey on his table; but he stipulates that his patrons shall have the very best that money can buy. His customers come from all over the United States; and when they arrive at the town where there are so large investments in bees and bee culture, they naturally expect to find the finest and best of honey, and they are not disappointed. We are furnishing to the hotel alfalfa because we have not much else of late. These traveling men are loud in their praises of this honey, even inquiring where it can be obtained, in order that they may keep it in their homes.

#### THE WELLS SYSTEM.

THE present discussion regarding the possibility of retaining more than one queen in a hive brings back memories of the time when the pages of the *British Bee Journal* teemed with references to the Wells hives, which were (and are) worked with two queens. In this hive the queens are separated by a wooden division-board having perforations  $\frac{1}{8}$  inch in diameter. This does not allow the bees to pass, but allows the same odor to perme-

ate the whole hive. In some cases the bees were allowed to work together on the same sections, the latter being placed above a queen-excluding honey-board. The reason why a wood division-board was used was to allow the bees to form one cluster, one colony clinging to one side of the board, and the other to the opposite side. The division-board gets clogged with propolis, and it is quite a job to clean it; but some hold there is no need of cleaning it very often, as the colonies retain the same odor in any case.

In the years 1893, '94, '95, '96, the *British Bee Journal* gave all due aid and encouragement to the double-queen system; but we see little about it now.

Dzierzon was a strenuous advocate of more than one colony in a hive, twin hives being his favorites, and he also had four-colony hives in his apiary. He did not advocate these hives to be worked as single colonies, but merely from the increased warmth and comfort engendered by the bees being associated together under one roof.

Some experimenters with the Wells system actually kept as many as four queens—two above the zinc and two below—the two upper ones being young queens to take the place of those below.

In one instance, at least, a swarm issued from a Wells hive which weighed 14 pounds. It does not follow, because the Wells system did not succeed in establishing itself, that the underlying idea should be discarded. The two-queen system requires rather skillful management, and for that reason it appeals more to the specialist than any one else.

W. K. M.

#### "ARE BEES REFLEX MACHINES?"

DON'T be scared at the title. It is not so "reflex" or, rather, complex, as it may seem. The title means, in other words, Are bees purposive or reasoning machines, or do they act automatically and unconsciously through instinct? We may say that scientific men are not agreed as to where instinct ends and reason begins in animals. This whole question is discussed in a masterly way; and so far from being dry scientific reading it is intensely interesting.

It has been some time since we promised to begin the publication of this valuable work; but we have been delayed by one thing and another until some of our readers began to wonder whether we were going to make our promise good. This, it will be noted, we are doing in this issue on p. 223.

Dr. von Buttel-Reepen (whose picture appears on p. 222), the author of the paper, is not only a practical bee-keeper, but a man of science. His deductions and conclusions, therefore, on the natural history and habits of the honey-bee will be read with more than ordinary interest. He strikes on a number of interesting problems, viewing them not only from the standpoint of science but from practical every-day work. He does not claim to be infallible, for, in fact, he leaves his readers to do some of their own thinking, placing before them a collection

of interesting data on which he himself draws certain conclusions which the reader may accept or reject as he prefers.

Instead of only a page or two at a time we are placing before our readers whole chapters, and these will be given in every fourth or fifth issue of this journal in order that the reader may have opportunity in the mean time to think over and digest some of the leading points.

So valuable is this paper that we have already printed it in pamphlet form, consisting of 48 pages, which will be furnished for 35 cts. per copy postpaid.

We may say that the work was originally published in German, and caused a great deal of comment in Europe. Dr. E. F. Phillips, of the United States Department of Agriculture, in charge of apiculture, was so much pleased with it that he strongly urged us to publish it in English. After going over the translation we were delighted with it, and now take pleasure in placing it before our readers.

Dr Phillips has read carefully every page of this, comparing carefully the translation with the original German; and it will be observed that he has made in some places a few comments of his own.

As will be noted in the preface the author has carefully revised the old edition, adding some new matter gleaned from his later experience. Taking it all in all, we believe we are offering to our American readers a gold-mine of interesting information on the natural history of the honey-bee, and practical also, because it will enable the bee-keeper to earn more dollars from his bees.

#### BEES VS. SMELTER SMOKE; A SERIOUS CONDITION OF AFFAIRS.

GLEANINGS alluded, p. 616, May 1, to the total extinction of the bee industry in the Jordan Valley country in Utah, and to the successful efforts of the Utah Bee-keepers' Association in compelling the smelter-owners to compensate the apiarists for the loss of their bees and hives. No compensation was made or offered for the loss of the annual income which would naturally arise from the industry. The locality was particularly good for bees; and as the number of colonies it would naturally support is somewhere near 20,000, it follows the annual income lost to the State is between \$100,000 and \$200,000. This looks like a serious loss to the State.

But this is not all. Other industries are being affected by the presence of the smelters; and Mr. E. S. Lovesy, President of the U. B. K. A., returns to the charge in the Dec. 21st issue of the *Deseret Farmer*. He shows the situation is quite serious. He states, "Even now many are complaining of weakness, indigestion, head dizziness, sore eyes, etc.; and in order to try to obtain better health many people have moved from their homes. With these facts staring us in the face, and also the fact that the soil itself is being destroyed for agricultural purposes, we think that something should be done."

It certainly looks as if something should be done, and GLEANINGS is willing to do all it can to help in the good work; and we are decidedly of the opinion the whole fraternity of bee-keepers would lend a helping hand in a great struggle. United, we stand; divided, we fall.

The smelters can find many localities in Utah where there is no agriculture, and where their presence would do no harm. Public opinion alone will force the smelting-works to move, and we respectfully suggest to our Utah friends to commence at once creating a sentiment against these smelters being permitted to destroy the agriculture of one of the most beautiful valleys in the West. The law of priority certainly applies here with great force; and with the strong backing of public opinion the farmers ought to win.

W. K. M.

#### BEE-KEEPING IN THE HAWAIIAN ISLANDS; IS THERE A POSSIBILITY THAT HAWAIIAN HONEY MAY COMPETE WITH AMERICAN HONEY?

It is not generally known, perhaps, that big syndicates are keeping bees in the Hawaiian Islands, and that the business is said to be very profitable; but, unfortunately for them, their honey does not conform to the United States standards, and therefore must be sold as honey-dew honey, which it greatly resembles. So great are the bee-keeping interests of Hawaii that the United States government is about to send Dr. E. F. Phillips, in charge of apiculture at the Department of Agriculture, to investigate conditions there, and to give the results of his findings in a bulletin which, doubtless, will be issued later. He expects to sail for Honolulu on the 20th of February, on the trans-Pacific transport Crook, of the War Department, returning after a sojourn of some weeks on the islands.

The fact that our dear Uncle Sam (or, more exactly speaking, Dr. L. O. Howard) is sending one of his employees to investigate bee-keeping conditions in our Pacific possessions shows how much interest he is taking in bee-keeping in general. We certainly appreciate the many services he has rendered us already, and especially his interest in this matter. Whether Hawaiian honey will ever be a serious competitor to the American product, we can not say. Cuban honey, at least of late years, has not proven so.

#### LEASING THE PUBLIC LAND.

DESPITE considerable opposition in certain quarters, the proposal of President Roosevelt to lease the land belonging to the federal government is gaining friends rapidly. Buffalo Bill is reported to be strongly in favor of the move. This means a good deal to bee-keepers whose bees graze on government land, for under the new system it would be possible to get exclusive rights to a bee-range, either at a nominal figure or no charge at all, as is now the case on forest reserves.

W. K. M.

#### KEEPING 1500 COLONIES FROM SWARMING.

"My name is O. B. Metcalfe, and I should like to have you tell me how to keep my 1500 colonies of Italian and hybrid bees from swarming next spring. Here in New Mexico I can get no skilled help, with the exception, perhaps, of one man who knows something of bees, so I shall have to do most of the work myself. Can you refer me to some good treatise on the control of swarming?"

"I know of no plan for controlling swarming which has been put into treatise form, and I am not sure that any one in the world knows of any plan which will do away with *all* swarming under *all* circumstances, or during all seasons and in all localities."

"Then you do not think that I shall be able to keep my 1500 colonies from swarming?"

"I do not think that there is a person in the United States who could keep *all* those colonies from swarming in a season conducive to excessive swarming; but I do think that, in seasons where the desire to swarm is only ordinary, swarming can be nearly prevented, and also reduced considerably in a year when the tendency is toward excessive swarming. However, allow me to say that *one* man would have better prospects of accomplishing what he desires along the line of swarm control with 500 colonies than he would with 1500."

"I presume that is right; but in the absence of help to be depended on, I must do the best I can alone, or with what little help I can get. I had thought of making a nucleus from every strong colony, something after the plan you gave on page 1433 of the November 15th issue, 1907; but I wish you would tell me what would be the result if the expected harvest did not come."

"The result would be very nearly the same as it would be in following any similar plan when the crop fails; that is, we should have all of our labor for nothing, or very nearly so."

"But might it not be worse than this? Might not our colonies be better off if we had not touched them if no honey-flow happens to come?"

"Possibly. But I can hardly foresee how this could happen here in Central New Mexico. Tell me what you are driving at."

"Last spring our colonies were storing from one to three pounds a day according to the scale-hive, just prior to May 21; but on the night of that day it froze both the mesquite and the willow, and nothing bloomed to do any good for a month."

"Whew! I thought our late frosts here in

New York were bad enough; but we have had no frost so proportionally late in the season. It is rare that we have to make any effort at stopping swarming here before June 5 to 15; and after that date I have never known a frost to kill any thing except some tender plant close to the ground, on some very low land subject to a white frost on the least provocation. This would not injure any of our nectar-producing flora."

"Well, suppose you did have such a frost just after you had formed your one-frame nucleus with the queen, and one comb of brood and bees taken from a strong colony to keep it from swarming. What would have been the effect on such a nucleus?"

"If such a frost should come the first night after the nucleus was made, it would be injured if many of the bees had returned to their old home; but as the most of the bees so separated will remain with their old queen when she is with them, I should not expect any great loss of brood in the nucleus. If cold freezing weather held on for three or four days the loss of brood might be greater; but, generally, after one of our late frosts it warms up the next day, or the day after, and, during such a short spell of cold weather, the bees 'burn' honey enough to keep up the necessary heat to protect their brood, so no material loss is noticed."

"But what if, on the second day, the bees had killed all the drones just before the young queens went out on their wedding-flight?"

"I never knew of such a thing in all my forty years' experience, and I doubt if such could have been known even in New Mexico—not but that I think your bees did kill their drones, but I do not think they would had you been following the plan as given on the page of GLEANINGS referred to. If I mistake not, your drones were killed while the old queen was in the hive, so it was not necessary for the bees to keep the drones; but *with queens just ready to mate*, drones to such a colony are as a bank account to a man in time of famine, and would be as carefully preserved. In fact, the bees would preserve the drones just as carefully as they would the queen, for just at this time drones would be of as much value toward the future welfare of the colony as the queen."

"Possibly you are right. But how about the ripe queen-cells? I noted that the freeze put a stop to the swarming in 48 hours, and that every queen-cell was destroyed."

"If you raised your queen-cells from your *very best* breeder, the colonies rearing such queens would either be queenless or the cells would be kept away from the laying queen by queen-excluding metal; and, so far as I ever knew, the bees would preserve them through any cold spell at this stage of the season. I have known of queen-cells being destroyed, drones killed off, and swarming postponed indefinitely during such a cold spell in the swarming season; but I never knew of drones being killed in any colony with a young queen just ready to mate, nor of queen-cells being destroyed in

a queenless colony, nor in a colony where the queen was kept away by an excluder during the swarming season. Late in the fall I have had queen-cells destroyed to a greater or less extent above a queen-excluder."

"I see there are some things which I had not taken fully into consideration. I had supposed that, if I had been in the midst of making nuclei to stop swarming, the effect would have been disastrous in a season like the last."

"Of course, such a state of affairs as came through your freeze would put a blue aspect over all apicultural affairs; but I do not see why it would have been any more blue, had you been trying to prevent swarming, than it was when you were allowing the bees to take their own course. It seems the freeze stopped all prospects of swarming, as well as all of the nectar-flow, and changed the tide of affairs generally. Such things as these come to us once in a while; but they should not deter us from striving to do the best we can. We should lay our plans with an expectancy of a good season. You remember the old question, 'What if the flowers never bloomed for fear of the storm?'"

"One more question: What kind of queens would I get, if, instead of going around ten days after the old queen was removed, and, cutting the cells the bees had reared, and giving a different cell, I just let them go on and hatch their own?"

"The first thought just here is not what kind of queens you would get, but what kind of swarming *rumpus* you would have. It would be ten times better not to try to stop swarming than to allow the bees to keep those cells they would rear after the queen was taken away. I know you could try to cut all the queen-cells but one; but it would be far easier to go through the hive in a hurry, cutting *all* cells, and then giving a cell from your best queen. This would save hunting some perfect cell the bees had reared. In shaking the bees off the combs so as to find *all* the cells, always remember that *not one single cell* which has been so shaken can be depended on to give a perfect queen; therefore, unless you clip off the one cell before you shake the frame, you have no business trying to save any queen-cells from that hive."

"But if I should see fit to clip off the cells before shaking, and ignore the question of breeding up to a higher standard of bees, would not such queens be good prolific ones of their kind?"

"If you selected the most perfect of the cells, they would probably give you fairly good queens; but you would have no assurance just when the young queens from these cells would emerge; while, as a rule, such queens tend toward a deterioration of stock rather than an uplifting of it. I do not see where any thing is to be gained by saving such cells promiscuously reared, either in time or honey; but I do see a great amount of uncertainty which will be entirely avoided by rearing your queens from your best

stock, and having them ripen just at the time you will be likely to need them for use."

While you are making money at keeping bees why not make all you can? It can be done. Better bees, good management, short cuts, profitable marketing, etc., will help to do it.

Supplies are too high in price to tolerate poor colonies in expensive hives. The remedy is hardly "cheaper" hives but better bees. A poor colony in a "cheap" hive will not give as profitable results as a rousing one in a good hive.

The handling of combs individually, and brushing off the bees, is a thing of the past with me. I can accomplish ten times more in a given time by using shallow supers when removing honey from the hives than by taking out and brushing each comb.

With the increasing demand for pure honey, and the many localities that are proving "no more good" for honey production, on account of the clearing of the timbered land, and cultivation, there need be no fear of an overproduction of honey. In addition to this the pure-food laws will help wonderfully in increasing the demand for pure honey, and there will never be produced enough honey if it is rightly distributed. Hence it is also easily perceivable that the prices will be still better in the future. Prospects were never brighter for bee-keeping than now. It is up to the bee-keepers, however, to make the best out of it.

It pays the bee-keeper to go visiting occasionally. Whenever occasion offers, take a trip around to other bee-keepers, and a short stay with them may make you more enthusiastic when at home again. It may also help you to learn many new and valuable kinks that will save you money and trouble or unnecessary labor. There is nothing like "rubbing up against" others of our craft, and it will only make the bee-keeping ties the stronger; for "we be brethren." This may eventually lead to the better organization of bee-keepers throughout the entire country. "In union there is strength." I always feel well repaid after returning home from such trips.

The tendency here in the Southwest is toward the production of more extracted than comb honey. Section comb honey has

been practically a thing of the past for several years; but bulk-comb-honey production has reached vast proportions. There has always been a great demand for this kind of honey. In the first place, the customers knew it was pure honey, and they had the advantage of getting full weight for their money; besides, the price was lower than that of section honey. The disadvantages, however, are the granulation of the contents in the cans later in the season; and as it can not be reliquified without melting the combs it can not be kept over the season or for better prices, like extracted honey.

#### HONEY-LABELS.

Labels on all your honey packages will pay. They help to advertise. That's why all kinds of canned goods and other packages—yes, almost every thing nowadays—are labeled nicely, bearing the name of the contents or the article itself with that of the producer or manufacturer, and often other matter, such as directions for using, or calling attention to its good qualities. Still, thousands upon thousands of packages of honey leave the producers without any label or name on them. Try labels. They make the cans or cases look neater, hence help to sell, and do a lot of advertising, thus repaying for the extra trouble in two ways. Tin pails and cans, if not too large, can be covered entirely with a label, while glass and large packages bear only a smaller label. On the labels that I am using are given directions for reliquifying the honey in case of granulation; and below this in bolder type, "We shall try to keep both comb and extracted honey, also beeswax, on hand the whole season, and solicit your orders." This also has a place on our letter-heads, and we have received many inquiries for prices of our honey, resulting in sales later. For putting the labels on, common wheat flour, mixed with cold water, was more satisfactory than any other pastes that I have tried, besides being the cheapest and most readily made. Labels of this kind are very much like an "ad." in a paper. "It may be bought by one customer, but will be read by a dozen others."

#### CUTTING OUT THE MIDDLE-MAN.

There is less use for the "middle-man" as a business is built up for dealing direct from the producer to the consumer. This has been my object for many years, and it has profited me to deal in this way. The producer should strive to cultivate a confidence between himself and the consumer. Then the customers know that they can depend on getting "a square deal," and they are willing to pay a good price for it. Thus the profits are much larger—both the profits from the middle-man to the producer, the profits which would have gone from the consumer to the middle-man, and generally, also, a little more than this, that the consumer has been willing to pay the producer, all going into the bee-keeper's pockets.

Instead of selling my crop to one or more

large dealers I have preferred to sell to a greater number of people in smaller quantities. As stated before, the extra profits pay me well for this; and, besides, it gives me a wider range of customers. I become more directly acquainted with them, and from these to others, so that the chances for disposing of my annual crop at good prices increase from year to year. If my crop is dumped into the hands of a dealer, a lower price is obtained for it, and that is the last of it. Where it goes and what is done with it after that I never know. On the other hand, I do know, and price lists can be mailed when the new crop is ready. Generally such customers buy year after year, and I avoid the danger of finding the middle-man already stocked with honey from somebody else.

#### EXHIBITING GRANULATED HONEY.

One of the most important features in our aparian exhibits the past season has been the education of the public in regard to the granulation of honey. The exhibits contained large quantities of honey in the granulated state, and right beside it was the extracted honey in the liquid form. The contrast caught the eyes of the visitors, and no question was oftener asked than "Please can you tell us why *that* honey looks so white?" My answer was always a frank one—"Why, we have this here just on purpose to have you all ask such questions." Then, taking a small jar of each, one of the granulated and one liquid extra, kept handy for the purpose, I would proceed to explain. "You see, this is nice and liquid, just as it came from the hive. Now, that *white* honey here is exactly the same thing that this liquid honey is. Cool weather has caused it to turn hard—it has granulated. Nearly all pure honey does this as soon as cold weather comes, and it is, indeed, one of the best proofs of its purity. If you want to be sure that you are buying pure honey, buy it in this granulated state. Many people prefer it in this way; but those who do not can easily reliquify it by simply setting the vessel containing the honey on some small pieces of wood in another vessel with water, and heating it until all the honey has melted. It must not get too hot, however, as that spoils its flavor. Hence you see again that this liquid honey in this jar is the same as that white or granulated honey; for we have done exactly what I have told you—reliquified granulated honey so we could exhibit it in the liquid state, because all of our honey has been granulated for over a month. So you see it is a mistake to suppose that honey is not pure because it has granulated; and then it is very easy to restore it to its liquid state again."

This was harped over again and again, each time bringing out a similar response—"Why, we never did know that, and we are so glad you told us. We'll know next time what to do with it when some granulates again. We certainly appreciate your explanation, and thank you many times for the information."

Then the next lot of persons received the same "treatment." As soon as I began to "explain" to one or more persons others would crowd closer so that one talk served a lot at a time. As soon as this dispersed, another crowd congregated, and so on.

This is given here to show how such an important subject can be handled at our fairs. Others should do the same at their fairs. It is very easy, and the sooner the general public becomes familiar with granulated honey the better for it and the producers of extracted honey. Of course, it makes a person hoarse to talk all day long; but I have often thought I could keep up with the fakirs who made their share by talking; and while doing this I used a good deal of the granulated honey for my throat. It is good for that purpose also.

In addition to talking on the subject it is well to have printed matter for the visitors to take home with them. Many will then read over again some of the things they have learned, and remember them better. This was done at both our State fairs at Dallas and the International fair at San Antonio.

I did not suppose it was any thing so very unusual for bees to store honey under their brood as J. E. Hand would have us think. Why, I have had them build comb and store honey outside their hives and below the entrance when crowded inside.

Dr. Miller's method of supplying bees with water is not only novel, but I believe the most practical of any that has been heretofore described. Those who have never given their bees water have little idea how much they will take when it is convenient to the apiary in a sheltered place.

"How long does it take a colony to discover the loss of a queen?" Stray Straw, Dec. 1. Dadant says, "After within an hour," and the editor's opinion is that it seldom takes longer. Yet I have had one or more cases where a queen was taken away, and, so far as I could judge, the colony did not discover its loss till the brood was too old to rear another, and this in the spring of the year.

I am much interested in ventilation of beecellars. Last winter my cellar was for a considerable time up to 60°, but with a large opening into a chimney with a good draft. Most colonies came out strong. This winter so far the temperature has been up to 55°

most of the time. Only once have I seen it as low as 45°, and then for only a short time. This morning, with a temperature outside at 4°, the thermometer in the bee-cellar stands at 48°. I have a feeling that it is not very objectionable to have the temperature rather high the fore part of the winter.

The statement of the *Chicago Record-Herald* in regard to the present status of the liquor-traffic is of interest. *Harper's Weekly* estimates that at present one-half of the territory of the United States is under prohibitory law, either through State or local-option laws. Prohibition a failure in Maine! So it was claimed for Vermont, so that, after nearly or quite fifty years of prohibition, our State changed to local option; and although most of the towns of Vermont refused to license this infernal traffic, yet for the first four years under local option crime has been more than twice what it was the last four years under prohibition.

I am glad GLEANINGS calls attention to the danger to our country from the destruction of our forests. The American people are a reading people; and if all our papers, magazines, and trade journals call attention to the danger ahead it would seem as though the evil might to some extent be averted. A bee-keeper in a nearby town has bought a large tract of forest land near his home to preserve the basswood for his bees. I believe the investment is a good one. By gradually cutting out undesirable varieties of trees, and allowing the young seedling basswoods to grow, in time he would have not alone good pasturage for his bees, but also a fortune in his hundred acres of basswood forest.

Professor Cook, in his interesting enumeration of the enemies of bees, Dec. 1st, speaks of that very little bee-moth with a very great name, "*Ephesia interpunctella*," saying it will be little feared by any bee-keeper worth the name. Well, it isn't so bad as it might be; but where, after a bad season and heavy losses, such as sometimes occur, and we try to keep the combs over for two or three years, and these little scamps get into them, they are likely to do a good deal of harm. One of the worst counts I have against them is that the larvæ seem capable of withstanding almost any amount of cold without harm, while the larger moth larvæ are always killed in our bee-houses during the winter.

I believe Mr. H. A. Sackett's idea of covering sections of honey with transparent paper is a new idea of more than usual value. For more than half a century the New York markets have been partial to honey put up in glass, while in Boston it must, to bring highest prices, be in paper cartons. Now, here we have a compromise—honey in paper, but transparent, and which answers for glass. It also keeps honey from dripping, which alone should recommend it. I wonder if tinted paper would make honey look as

attractive as tinted mosquito-netting improves a basket of peaches when spread over them.

R. F. Holtermann says, p. 1494, "If I had honey-dew once outside of a hive I would keep it there." Hold a moment, my friend. I want to tell you something. That honey-dew is worthless—yes, worse than worthless—to sell for honey for food. I should not want to sell it even to the bakers; and as to making vinegar, it will be honey-dew vinegar, and you had better not sell that. Some twelve or fifteen years ago we had a season here in which the bees the last of August and early September filled their hives almost solid with honey-dew (insect) honey. Of course, I lost heavily the following winter, and had the next spring thousands of pounds of this dreadful honey-dew out of their hives. What did I do with it? Why, I just saved it carefully and fed it in spring for several years to colonies that were short of stores, or for stimulating brood-rearing. I don't see but it was worth as much as other honey for that purpose.

All honor to Gov. Frank Hanly, A. I. Root, and a host of men and women who are fighting to overthrow the liquor-traffic. For many years they have been the butt of ridicule for politicians, saloon-keepers, and fools; but the tide has turned, and now half of our country is under wholesome prohibitive laws. Soon it will be very respectable to be on the side of temperance. Already saloon-keepers are tolling bells as they close their saloons for good, and I have read of one who actually committed suicide, as the outlook for his business was so bad. The strongholds of the enemy are falling thick and fast.

Well, what has all this to do with bee-keeping? Just this: When the hundreds of thousands or millions of women and children who now go hungry because of this wicked traffic shall have bread enough to supply their wants they will want honey to go with it, and there will be money enough to buy it. There will then be no lack of market for all the honey we can produce, and at good prices too. Shall we not discern the signs of the times?

#### ANOTHER BEE-PRESERVE.

PRESIDENT ROOSEVELT has just signed a proclamation which will have the effect of creating the Verde National Forest. It is situated in Maricopa and Yavapai Counties, Arizona, on the west side of the Verde River. It has been deemed wise to set aside this land with a view to protecting the flow of water in the Verde River. It has been indorsed by the Reclamation Service. The "trees" are said to be valueless by lumbermen; but bee-keepers are probably well satisfied with them, seeing they are mostly nectar-yielders of no mean order. It is also probable some valuable timber tree will be found to thrive there, very likely one of the eucalypts.

W. K. M.

#### QUEEN-REARING.

Should the Honey producer Rear his Queens or Buy them? Using Extra Cells from Colonies that Cast Swarms only Perpetuates the Swarming Tendency.

BY E. W. ALEXANDER.

Frequently I am asked whether it pays a producer to rear his own queens. This is a rather hard question to answer, for so much depends on the ability of that producer, and on his experience in rearing good queens. Many circumstances also have a bearing on the subject, such as the number of queens required annually, the kind of honey produced, whether comb or extracted, the time the surplus is secured, and the liability of the young queens mating with undesirable drones. All these circumstances and many more should be well considered before the producer decides to rear his queens. If he has but few colonies, and is anxious to learn all he can about bee-keeping, without any regard to the amount of surplus he may secure, then I would advise him to purchase a good breeding-queen and learn as soon as possible how to rear choice queens. In that way his experience will be worth much to him as long as he continues to keep bees.

One of the worst troubles in rearing a large number of choice early queens here at the North is our cold backward spring weather. We use about 400 young queens a year in our apiary, and have tried many times to rear them during the latter part of May and fore part of June, so as to have them laying about June 10; but it is almost impossible to rear so many good queens at that season of the year. If we wait till the latter part of June to rear them, then the bees from these queens are of but little use as honey-gatherers until after the best of the harvest is over. So we find it much better to pay considerable money each year for our queens instead of trying to rear them.

About the first of December we gave a noted queen breeder our order for 400 queens, to be sent us between the 1st and 20th of June next. It requires time, bees, skill, and honey to rear good queens; and when they can be bought for from \$65 to \$75 per hundred, and extracted honey is worth 7 and 8 cents per lb. by the carload, it does not pay to sacrifice much surplus in order to rear queens.

When the ordinary honey-producer attempts to rear his queens he is very apt to make some serious mistakes, partly through ignorance and partly through a lack of time

to give this part of his business the close attention it requires.

If he would procure a good breeding-queen and rear all his queens from her, then weed out and destroy all small inferior queens as soon as they hatch, he might have choice queens without much expense except for a part of his time, and a certain per cent of his surplus. There is quite a difference of opinion as to the necessary amount of bees it requires to rear choice cells and queens. Some claim it can be done with but few bees; others want strong colonies to produce choice cells. I know we could never rear queens that would suit us unless we used so many bees in rearing our cells that it would make a sad inroad on our surplus honey.

The most common and the worst mistake that can be made in rearing queens is saving the natural cells and virgin queens from colonies that have cast natural swarms. I have heard this method recommended by men who were considered quite good authority, and it seemed as if I could not keep still and listen to them. We spend valuable time at our conventions in discussing various ways for preventing natural swarming, and we frequently see long articles in our journals from noted writers recommending certain methods to prevent it. Almost daily during the summer season we see bad results in our apiaries from excessive swarming, and then so many will do the very thing of all things that will perpetuate the desire to swarm, by saving cells and virgins from the colonies that are the first to swarm; and invariably when this objectionable method has been practiced a few years a strain of bees will be developed that is ready to swarm both in season and out of season. Nor is this all; for a great step backward is taken, and the bees from the first will begin to degenerate, and part of their yellow color will be lost; and the bees themselves being crosser and more irritable, they fail to gather as much surplus, and they become more nervous in winter. In a few years the apiary will have degenerated until it is of but little value. It must then be built up again with good stock.

In view of these facts do not take such a step backward as will bring only loss, trouble, and disappointment. When a colony has many valuable traits, send its queen to your queen-breeder, and write him, describing all those good points, and request him to rear the queens from her unless he may have a still better breeding-queen. In this way the choicest of queens may be reared from the best stock, and improvement can be made along the lines most desired.

As I look back I find that the seasons when we received our largest surplus have been, without a single exception, the ones following the year when we reared our queens from some special queen whose colony had given us an unusual amount of surplus the previous summer. It requires only four or five years of careful selection to make a great change in bees in their honey-gathering qualities, and in their disposition, until they seem

like a different race of bees. The color is one of the quickest of all points to show improvement, and the tendency to swarm can be reduced to a surprising extent; but special care must be taken to select the best standard. Nor is this all. The drone-mothers must be just as choice as the queen-mothers. You must rear all drones from as choice queens as you rear your queens from. In other words, drones must be developed the same as the queens. This may seem like an unnecessary amount of trouble; but there is little of value in this world that does not cost labor to acquire.

There are many bee-keepers who might make great improvements in their bees if they would only start in the right way. They seem to think that, if they buy a breeding-queen once in a year or two, it is about all that is necessary; and if her colony swarms they will try to save some of the queen-cells, and then think they are improving their bees. Such a line of management is no improvement; and if that is the best that can be done, then it would be better to buy all the queens from some one who is doing better. The whole subject turns on this point: The best queens, bought or home-reared, are none too good, and the aim should be to make them still better with each succeeding generation.

Delanson, N. Y.

[This question of using swarming-cells for the rearing of queens for the production of honey is a very important one. If it is fact, that the practice accentuates the swarming tendency in our bees, we may well stop and ask the question, Does it pay? We should be glad to hear from our subscribers who may have been gathering data on the proposition.—ED.]

## THE SIBBALD WAX-PRESS.

A Combination of the Hatch and Hershiser Principles; a Description and How to Operate.

BY R. F. HOLTERMANN.

At the annual meeting of the Ontario Bee-keepers' Association in Toronto, and by special request at the Brant District Bee-keepers' convention, Mr. H. G. Sibbald, Claude, Ontario, gave a description of a wax-press which was considered valuable by those present.

It would be necessary to go through all the stages of wax-rendering and to recount all the thoughts, time, and material that have been expended upon improving the methods of rendering wax, to parallel in magnitude the enormous amount of wax and the sums of money which have been and are being thrown away in the imperfect rendering of old comb, cappings, and the like. This amount is, perhaps, more than doubled by money which has been worse than thrown away by allowing the wax-moth to destroy comb upon which the bees have perished.

Let us profit by the past, and at least use some of the most up-to-date methods obtainable.

For even a small bee-keeper, a press of some kind, as over the old methods, will soon pay for itself. There is practically no economic method of rendering without it. Machines defective in one locality or under one condition may answer well in another.

For instance, in a hot climate, or where wax-rendering can conveniently be left until hot weather, the method of heating the wax in a vessel on the stove and then pressing in a machine not being heated on the stove, is perhaps the cheapest machine and the most rapid and economic method, and will answer well. But where the spare time is in the winter, and the operating-room can not be kept at a very high temperature, the wax at any exposed part or among the cloth itself soon gets cold, and the wax thus confined results in loss.

In the Hershiser wax-press we have a machine which remains on the stove and has heat applied to it while in operation, and it can, therefore, be operated in a comparatively cold room; but it takes considerable time to heat the machine and its contents. From my experience each of the above machines will do good work, and, on the other hand, with them, as with any machine, wasteful work can be done.

Mr. Sibbald, who was for two years president of the Ontario Bee-keepers' Association, and who is a successful, intelligent, and extensive honey-producer, and who has in the neighborhood of four hundred colonies of bees, and is a prize-winner in both comb and extracted honey, and who is one of the six foul-brood inspectors of the province, stated that he had designed the press, availing himself of the best thoughts of other inventors. He had arranged the machine so that any one who had a Hatch-Gemmell press could use the most expensive part of it in the new design.

In describing the machine, Mr. Sibbald states:

"The sketch makes the principle of the press pretty clear. To operate, a common stove and boiler may be used for melting the

is folded over and pinned. The form is then taken out and another set of slats placed upon the cheese-cloth and contents just prepared. The form is again placed on the slats; a cheese-cloth is again spread over the form, and two inches deep again filled into the form, when the cloth is folded over and pinned as before. Form 6 is again taken out and the operation again repeated, and the last cheese is made and the form removed, when a top set of slats is put upon the pile.

The tank (4) is then pushed back until under the screw, which is then tightened. The hot water from which the melted combs or slumgum has been skimmed is then poured into the tank (4), filling it up to within half an inch of the overflow lip, and so as quite to overflow the slats and cheeses. The tank is covered by means of two boards so as to keep all warm, and the screw is given a few turns down. This is left for a few minutes while the boiler is again filled. Continue the turning-down of the screw every few minutes; loosen it occasionally, and allow hot water to soak back into the cheeses and thereby wash out the wax, when the screw is again tightened.

By the time the next boilerful of old comb is nearing the boiling-point the wax is overflowed or skimmed off by either adding more hot water from a second boiler or by tipping up the opposite side until the wax which is, of course, on top, is all run off.

The water is next let off from the top in front, and used for the next boilerful. Being still quite hot, time and heat are saved. Now loosen the screw, draw the tank forward until clear of the top-bar (2); take out the three top sets of slats and refuse. Put in form (6); spread a cheese-cloth over the form as before, and proceed to refill the machine.

It will be seen that the system of gravitating the beeswax away from the material pressed, and away from grates, etc., can readily be applied to some machines in use. I might add that, in heating old comb, cappings from comb, or the like, if there is any honey slightly fermented among it, the

old combs or slumgum, which, when thoroughly melted and about to boil, is dipped or skimmed off, and poured into form 6, which has already been placed upon the bottom set of slats, and is covered by a cheese-cloth. When a depth of about two inches has been filled in the cheese-cloth the latter

boiler or other vessel will boil over very readily, and may result in the destruction of the building. Where such is not the case the heated mass will not boil over so readily; but just the same, *never leave a stove unattended that has such material upon it that is boiling or may come to the boiling-point at any moment.* I have known of at least two buildings being destroyed by fire in this way. Brantford, Canada.

## THICK SYRUP VERSUS THIN FOR WINTER STORES.

### Why a Thick Syrup is to be Preferred.

BY ALLAN LATHAM.

I have been requested to express my views upon the subject of feeding thick syrup late in the fall after I have first read Mr. Alexander's article on page 29.

There is scarcely a statement in that entire article which does not meet my unqualified approval, there being but one thing which I should wish to modify. I question the wisdom of feeding so large an amount as 14 lbs. of dry sugar to each colony unless the combs are very empty.

As eight or ten pounds of stores will carry a colony to the time of frequent spring flights, it seems scarcely warrantable for us to put an unnecessary amount of this foreign feed into our hives and thereby lay ourselves more open to the charge of sugar-fed honey. We can truthfully say that a colony of bees will, beyond all doubt, take care of ten pounds of sugar syrup which is fed late in the fall, even though they have abundance of honey beyond this; but there is too much likelihood of syrup becoming a part of future surplus from a colony which has at the time of the feeding a large store of honey, if more than about ten pounds be fed. Let us err on the right side rather than on the wrong side, if we are to err.

I believe in feeding thick syrup to bees for their winter stores, rather than thin, and feeding this syrup late. Why? Well, for two or three reasons—reasons which the editor has suggested in part in his footnote to the article of Mr. Alexander's. To feed thin syrup means a loss of both syrup and bee energy. The thinner the syrup, the greater the loss. Even with the proportion mentioned by Mr. Alexander there is a loss; and instead of there being 21 pounds of thick syrup in the combs as stores after feeding 14 pounds of sugar made into the 2-to-1 syrup, there will be but 17 (or at the most 18) pounds of syrup. If these same 14 pounds of sugar be fed in the form of a thin syrup, the resulting stores will not exceed 14 lbs of thick cured syrup, and they may fall even below 14.

When a thin syrup is fed, the bees get greatly excited, and will consume much syrup in the generation of useless heat; at the same time they will use up much of the life energy which they possess.

It is my honest belief that the idea that bees must have an inverted sugar for their

winter feed is sheer nonsense. The fact that bees invert sugar when fed to them thin led to the belief that the inversion was essential before the syrup was fit food for the mature bee. Where, may I ask, is the proof, or even logical demand for such a conclusion? Too many times have many of us utterly disproved that conclusion. My experience in the wintering of baby nuclei has offered me abundance of proof, for my best success has always attended the feeding of thick syrup late in the fall. The absurdity of the claim is seen again when we consider that one of the best of winter feeds for safety is a cake of sugar laid over the frames. This cake of sugar must be of the non-inverted kind, too, for otherwise it is likely to get thin and run down upon the bees to their ruin.

That the need of using an acid for the purpose of inverting the sugar fed is lacking so far as rendering the syrup fit food for the bees I have no doubt; that it is entirely lacking as regards the rendering of the syrup proof against crystallization I feel less certain. Personally, during all the years I have kept bees, and with all the winter feeding which I have practiced, I can not now recall one single instance in which the syrup crystallized in the combs. If it did so, it was to such a small extent as to escape my notice. I never use cream of tartar or other acid.

I have, however, never done much feeding of syrup as thick as 2 to 1. I have always found the bees little inclined to take care of syrup thus thick. Fed as Mr. Alexander advises—warm, and right under the cluster—it may go all right; but fed in nine-tenths of the various forms of feeders would result in only about one-tenth of the syrup being taken by the bees before the syrup got cold. After it was cold they would pay about as much attention to that syrup late in the fall as they would to ice-water. It is so thick when cold that the bee can scarcely draw it through its tongue, and it has no patience to stay away from the warm cluster long enough to get a load of syrup. No enthusiasm is aroused, and the feeding lags. If fed a trifle thinner, the bee loads up more quickly, and just enough enthusiasm is aroused to warm up the hive and make that syrup go into the combs with a rush. I find that a 5-to-3 proportion brings about such a result.

If fed 2 to 1, unless the bees take the syrup up immediately there will be more or less crystallization over the surface and along the edges, resulting in loss and bother. My method of feeding is by means of an atmospheric feeder, simply a fruit-jar or tin can inverted full of syrup upon a piece of thin board, and a wire nail placed under the edge of the can—a method too fussy in a large apiary, but excellent in a small one. Four quarts thus arranged in an empty super right over the brood nest will go over night, or before the next four quarts are fed the following night. Twelve and a half pounds of sugar made into 20 pounds of syrup will be taken in two feeds, and will result in about 15 pounds of ripened stores. If fed

right after the last brood is out of the cells this syrup will be mostly stored right where it will do the most good—that is, right about the brood-nest and within it. It will be the feed of the bees till spring arrives with its days of frequent flights. Less than that amount is enough unless the hives are very light.

There can be no question that we can winter our bees better upon sugar than we can upon ordinary honey. I had that proved last winter when my observatory hive which I had kept bees in continuously for nearly four years became depopulated. In the fall of 1906 it got enough honey to winter on, and I did not feed it with syrup as usual. The honey killed those bees, or, rather, the pollen in and about the honey. The winter was not severe, whereas three winters ago that little colony wintered through one of the hardest winters we have had for many years—the winter when there was such a frightful bee-mortality. Sugar syrup took them safely through.

Yet I feel that we should be slow in advocating this feeding of syrup except as a necessity. In a locality of mild winters, where bees have occasional flights, it is doubtful wisdom to go to the labor of substituting syrup for honey in our hives—especially as it will be difficult to defend the practice upon the ground of necessity, and we shall lay ourselves liable to a serious misunderstanding. It is difficult to convince the public that we are honest so long as we open up a chance for the public to spy a possibility of dishonesty.

For our Canadian friends, and also those in the far north of our own country, to use syrup as a regular winter food is an act so easy to defend upon the ground of necessity that no one should condemn it. Possibly for others of us further south to feed a few pounds of sugar just to get the bees through the first of the winter, or even to early spring, might be easily defended; but for one of us to go to a hive which has already 20 or 30 pounds of honey in it, and stuff that hive with nearly as much syrup, is decidedly wrong. We are tampering with honesty there, or at least playing with fire. Except in this one particular, as I stated above, I can agree with nearly every word in the article on page 29.

Though it may not be according to the teachings of years, late feeding of thick syrup is the thing, and not early feeding of thin syrup, if it be simply a matter of furnishing the colony with winter stores. If the purpose be other than to furnish winter stores, then it's another story, and that story I will not tell here.

Norwich, Conn., Jan. 8.

[In these days of the effective working of our national and State laws against all forms of adulteration of food stuffs, we have no fear that any syrup will be fed for any other purpose than to supply a winter food or to stimulate brood-rearing in the flying season. Sugar syrup, even if fed thin, and inverted,

is, by our modern methods of analysis, very easily detected, and no one, even if he be disposed to be dishonest, would dare take any chances. Bee-keepers are glad that it is so, for their product (honey) is of such superior merit that they do not need to cheapen it by the addition of an inferior sweet.

The question of a thick *versus* a thin syrup is still open for discussion. We should be pleased to hear from a good many who are in position to offer facts.—ED.]

## HOW SWARMS CHOOSE A LOCATION.

More Observations Confirming Those of G. C. Greiner.

BY J. C. BALCH.

The article by G. C. Greiner, page 1507, of the Dec. 1st issue, is in line with my experience. I remember that, in the winter of 1895, in Kansas, I lost quite a few colonies of bees. The combs were cleaned of dead bees, and the hives left on the stands with the entrance open. In the swarming season there were five swarms that came and took possession of empty hives in the apiary, and I know they came from parts unknown, because my bees were Italians, and those were blacks. The swarms all came in the forenoon, between 9 and 11 o'clock. I would see a few bees going in and out of a hive the day before they came, and the quantity of bees increased in the afternoon till there would be almost a pint of them around the hive, very restless, and busy going in and out, and, I think, going to and from the hive to the swarm and bringing other bees with them; then when night came they all went away; and the next day, as soon as the dew went off, and it began to get warm, the swarm came and went right in at the entrance. They did not stop to cluster, but just tumbled over each other in getting into the hive.

I once noticed some bees working busily around an empty hive all day. The next morning a neighbor came to my house a little after sunrise, and said he had found a swarm of bees. I went with him and hived them for him. They were about 30 rods from the apiary; and after hiving the swarm there were no more bees working around that empty hive. I am satisfied that, had he not found them, they would have hived themselves that forenoon in my hive.

Two years before that, there were three stray swarms that came to my apiary and went into empty hives in the same way. They always go into hives with combs in them the first year. It was into my extracting-supers they went. I had set them out in the apiary, preparatory to putting them on the hives. There was a pile of five or six supers. They were not set up perfectly true, and so left an entrance so the bees got in. Absconding swarms seldom go into a new hive unless there are three or four empty combs in it.

Ferndale, Wash., Dec. 11.

## WINTERING IN A SLIGHTLY DAMP CELLAR.

A Good Record; Disturbances Seem to Do no Harm.

BY WM. L. COOPER.

Having read with much interest Mr. Alexander's article on the necessity of quiet in an ideal bee-cellar, I think that a short account of the successful wintering of bees in a cellar which is by no means ideal may be of interest to some readers of GLEANINGS. My bee-cellar, which has been in use for that purpose for six years, is beneath a two-room dwelling-house. I never thought it a particularly damp cellar; but as roots do not dry out in it, it would not come under the definition of a dry cellar as lately given in GLEANINGS. Every day in the course of the winter, and often several times in the day, I am down in the cellar with a lantern, getting roots for the cattle. At least once every day the root-pulper is at work there—a thing not conducive to quiet. I admit that I was very nervous as to the effect of the pulper on the bees, but the results have proved satisfactory.

Last year seventy colonies went into winter quarters here, and the same number came out, apparently nearly as strong as they went in. Of nine colonies weighed, the lowest honey consumption was 5 lbs.; the highest, 14 lbs.; the average, rather over 8. The year before, 42 colonies were wintered without loss. In the six years, I have lost four colonies in this cellar, in every case from want of stores. The temperature varies from 42 to 47. There are three outside ventilators, and a pipe which passes through the floor into the stovepipe of the room above. One or more of the outside ventilators are closed in intensely cold weather, say from 30 to 40 below zero, especially if there is a high wind. These ventilators are wooden pipes four inches by eight; the one into the stovepipe is a four-inch galvanized-iron pipe.

The hives have their summer entrances, and are raised from the bottom-board at the back by two  $\frac{3}{4}$ -inch blocks. In bringing bees up from the yard, a piece of lumber is put in the entrance to prevent bees flying. On two occasions I forgot to remove this from a hive, but they seemed to winter about the same, so I suppose so much ventilation is not essential.

Apparently it is universally agreed among bee-keepers that brood-raising in the cellar is detrimental. My general rule is to set bees out on the first suitable day after April 15, and I generally look over every colony as soon as possible. I should say that, out of every ten colonies at this date, one will have a good deal of sealed brood and a few young bees; two will have a little sealed brood; five will have more or less unsealed brood, and two with eggs. I do not recollect ever finding a queen-right colony without eggs when taken from the cellar. It seems to make no difference what date bees are taken out after April 15, brood in something like the proportion mentioned will al-

ways be found. I have been unable to see that the vitality of the colony is seriously affected by this cellar brood-raising.

Just after getting bees out last spring we got a warm day. I had looked over ten colonies when it clouded over, and for two weeks after that it was not fit to open a hive. I was very sorry that I had meddled with those colonies at all. Yet when I next examined the apiary every one of the ten had progressed in brood-raising, proportionately to their strength, more than those which had been left alone. Was this a coincidence, or had the stirring-up actually stimulated them?

### A FURTHER REPORT ON THE ALEXANDER PLAN FOR WEAK COLONIES.

Last year you published an article by me describing my failure with the Alexander method of building up weak colonies in the spring. The bees did not fight, but the lower colony simply declined to assist the upper, and itself did not do well. This year I tried again. In one case it was a brilliant success, both colonies building up in a way that seemed almost incredible. In four others it failed again, and in three out of these four I have placed the cause of failure—the queen in the weak colony was “no good.” With Mr. Alexander's careful and methodical weeding-out of all poor queens this would not occur; but I suspect it accounts for many of the failures reported. Still, the fourth case remains a mystery to me. The lower colony was very strong, and there was no fighting; but two weeks after placing the weak colony on top there were just about as few bees in it as when it was first put there. The lower bees did not even help themselves to the unsealed honey, of which there was quite a lot. I had intended to raise a frame of brood and see if that would draw them up; but, finding a queenless colony, I transferred the top queen to it, and she did excellent work there.

Cannington Manor, Sask., Can.

[The cellar here described we should say is not necessarily a bad place in which to winter bees—quite the contrary. The dampness present is rather in its favor than otherwise. A place that is bone-dry is not as good as one where there is a reasonable amount of moisture. If a pudding is to be judged by the eating of it, this cellar is a good place in which to winter bees.—ED.]

### THE AMERICAN HIVE SYSTEM IN EUROPE.

ONE of the best bee-journals published in Germany is the *Deutsche Illustrierte Bienenzeitung*, published in Leipzig by C. F. W. Fest; yet in the number for January, Pastor Sträuli makes a strong plea for the American hive system. Some of the best bee authorities in Germany write for this journal—for example, the two Kranchers and Weygandt, so it can not be said that it is not representative of the country. In the same issue is an answer by Dr. Kuckuck himself to criticisms of his book on parthenogenesis by Dr. Buttel-Reepen, of Oldenburg. W. K. M.

## MAKING HIVES BY WIND POWER.

### A Home-made Windmill and Saw-table Constructed Wholly of House-building Material.

BY T. P. ROBINSON.

I never intended to be a bee-man. I began to keep bees when I was 16, caring for father's bees because they always stung him so fearfully. I was as poor as a church mouse when I was 21, and I began to keep bees for the money there is in them. Now I market many thousands of pounds of honey annually, although the business with me is but a side issue.

When my apiaries, in recent years, amounted to hundreds of colonies I found that, to buy factory-made hives, was a fearful drain on my bank account. Being a born mechanic, and a good practitioner of mechanical art, I determined to turn this talent to account in manufacturing my hives. It was a cheap matter to construct the saw and table necessary for making the hives; but the power to turn the saw was quite another thing. It would have been an expensive item in my case to install any of the artificial powers now in vogue. There was no water that could be "harnessed," but I was fortunately located on one of the great prairies of Texas where there is no obstruction to the strong steady winds.

I knew that there were hundreds of thousands of horsepower going to waste daily on my premises, which, if "harnessed," would do all the hive-making that I should want.

I therefore constructed a wind-motor which is a marvel of economy, simplicity, and power. I proposed to construct this out of house-building material, without damaging any of it over 10 per cent for house-building purposes, confining the damage to small items.

I procured a heavy 2½-inch white-metal gas-pipe nearly six feet long for the axle of the big mill. I purchased 8 2×4-inch scantling, 12 feet long, for the trestle and for the spokes of the wheel. The trestle for the mill is stationary, each part being braced with scantling. The horizontal scantling are bolted to posts that are buried deep in the ground. I made iron bearings for the bolsters of the trestles, in which the axle revolves. In the front I put on a two-foot pulley,

securing it to the axle by means of a pin. Back of the big windwheel, and out of view, I placed a solid wooden pulley, secured to the axle, which is used for a friction-brake.

The windwheel is of simple construction, as shown by the photograph. I used twelve-foot scantling for the spokes, put two arms across on each end of the scantling. Ten-foot corrugated roofing was cut in two, making sails 5 feet long and 26 in. wide. These I secured to the spokes and arms by means of screws and nails driven into the scantling at the edge, and bent down over the metal.

T. P. ROBINSON, BARTLETT, TEXAS, A BEE KEEPER WHO  
SAWS LUMBER FOR HIVES ON A HOME-MADE WIND-  
POWER SAW.

To make the frame-work more secure, it was guyed to the ground with telephone wire. The mill is nearly 20 feet high to the top of the sails. The power is transmitted by means of a rope belt from the pulley on the main axle to a pulley on an 18-foot  $\frac{3}{4}$ -inch gas-pipe used for a line-shaft. On the opposite end of the line-shaft a two-foot pulley is placed under the saw-table, on which a belt 2 inches wide is run to the six-inch saw. The table has a top  $3\frac{1}{2}$  ft. by 4 ft., on which is placed a movable top, set perfectly square in every direction with the saw. The top of the table, instead of the lumber, is fed to the saw in much of the work. This guarantees square cuts in every direction. The saw and mill are geared 40 to 1, and I have seen the mill clip off over 100 revolutions per minute, giving a rim speed on the saw of over one mile a minute. At this speed the only trouble the operator has is in getting boards to the saw fast enough.

The whole affair is set north and south so as to utilize the prevailing winds. It fronts south, but it runs just as well with a north wind. Of course, it will run backward; but all the operator has to do is to cross the driving-belt.

The photograph of the mill shows the piles of cut hives at my feet, showing the results of an hour's run. In another photo are shown a few supers and hives nailed and painted, as a product of this hive-plant. They are good enough for me.

In another engraving is shown a ten-frame hive complete, every bit of the sawing for which was done by the mill. Notice the construction of the lid. It is a little heavy, but will stand the weather. It can not warp, as two separate pieces above and below are clinch-nailed through and through. The frames are not self-spacing, but are of the regular Langstroth dimension, and therefore interchangeable with the Hoffman frames. The ten-frame two-full-story hive complete, with 20 frames for extracted honey, costs about 60 cts. for material.

The mill or hive-plant complete cost about \$12.00 for material, all told. I did all the

ROBINSON'S HOME-MADE WINDMILL FOR SAWING HIVE LUMBER.

work, made all the pulleys, mandrel for the saw, and all boxes or bearings, etc., here at my shop. The outfit paid for the material the first day it was run. I shall use the material in building as soon as I am done making hives for use. I have no hives or bee-supplies to sell.

Bartlett, Tex., Dec. 4, 1907.

[Any one who has skill enough to make a mill like this will certainly be able to make hives. The whole arrangement is very simple and ingenious, and we see no reason why some of our subscribers of a mechanical turn of mind could not do likewise. The scheme of using corrugated iron for the sails, and then using the material for building afterward, is certainly very unique. We should not have supposed that a mill that could not face the wind squarely at all points of the compass would be a success; but in territory such as our correspondent describes, it evidently does the work.—Ed.]

A PILE OF HIVES MADE WITH ROBINSON'S WIND-POWER BUZZ-SAW.

### UNCAPPING-BOXES.

Melting the Cappings as Fast as they are Sliced from the Combs; a Rapid Method for Separating the Honey and Wax.

BY H. H. ROOT.

Disposing of the cappings at extracting time is a subject that has been given much thought in the past; but, until recently, the various uncapping-cans and boxes have all been constructed in such a way as to provide means for holding the cappings while the greater part of the honey drained out of them. The dry (?) cappings were afterward melted up for wax. It takes considerable time for even the bulk of the honey to drain out, and so extra boxes, barrels, or cans are invariably pressed into service. Within the last year or two, several producers in California have been devoting their efforts toward an uncapping-box that would melt up the cappings as fast as they are sliced from the

TEN-FRAME HIVE COMPLETE, MADE WITH ROBINSON'S WIND-POWER BUZZ-SAW.

combs, thus permitting the honey and wax to separate readily after being drawn off through a spout into a pail or can. Among those who have been working on the idea may be mentioned M. H. Mendleson, John Y. Peterson, and L. E. Mercer. We intend to present descriptions of the other plans later; but since we have received the engravings of Mr. Mercer's outfit we will describe that first.

Mr. Mercer has been working on this problem for some time, and he has developed an outfit which he has used with a considerable degree of satisfaction. The general plan is shown by the accompanying engravings.

The plan of operation, in brief, is as follows:

The combs are uncapped as in any ordinary uncapping-box; but the cappings, instead of falling on a screen to drain, drop directly on to a tin bottom which slopes down toward an opening near

THE MERCER UNCAPPING-BOX.

The cappings, as fast as they are sliced from the combs, fall down into a hot pan where they are immediately melted. The honey and wax are thus separated.

THE MERCER UNCAPPING-BOX.

The stove shown would hardly be suitable. A blue-flame wickless kerosene-stove should be used

one end. The honey with the cappings furnishes sufficient lubrication to keep them constantly sliding down through this opening into the heated pan beneath. This smaller pan is surrounded by water, which is kept hot by an oil-stove, so that the cappings are immediately melted into wax. The capacity is not limited; for, when the heated pan is full, the honey and wax overflow through the trough into a pail, which is replaced by an empty one when full. When the work is done for the day, the wax cakes may be lifted out of the pail in good condition for market, leaving the honey entirely free from cappings.

The details of construction of the uncapping-box are shown

more clearly in the reproduction from the pen-drawing. The oil-stove shown is not the style that Mr. Mercer uses, for he has found that the blue-flame wickless kerosene-

DETAILS OF THE DOUBLE PAN IN WHICH THE CAPPINGS ARE MELTED.

stoves give the best satisfaction. Asbestos rings take the place of wicks, and these are never moved up or down, the supply of kerosene being regulated by a valve.

The large box is five feet long, two feet wide, and ten inches deep. There is a two-inch slant to the tin bottom, so that the cappings will more easily slide into the hot pan beneath. If, for any reason, the cappings should collect in the box in two great a quantity, an occasional push with a stick would send them down out of the way.

The hot pan is made double—that is, the arrangement is really a pan within a pan. The inside pan, which holds the wax and honey, is, of course, smaller and shallower than the outer one, and the sides are also more flaring. This gives the hot water a chance to surround the inner pan completely, so that the sides, as well as the bottom, are kept hot. Reference to the small illustration of the pan will make this clear. It will be noted that the outer can, which holds the water, is made enough longer to give a space just the right size for holding two uncapping-knives. This means that the blades will always be hot and clean.

The uncapping-box would not need to be so long were it not for the fact that it is a great convenience to have a rack for holding uncapped combs before they are placed in the extractor. By hanging the combs in the box, the honey that drips from them runs down with the cappings so that there are no extra pails or cans to watch.

Little need be said concerning the advantages of this plan. The cappings are never in the

way, and no bulky cans to hold them are necessary. The wax cakes are ready for market about as soon as the work is done, and no time is spent in rendering. The most expensive part of the outfit is the stove. A two-burner oil-stove of the style mentioned costs about five dollars; but it is a stove that is needed in every home, any way.

## DRUMMING BEES OUT OF A LOG GUM.

BY FRED J. CARTAN.

I am sending you a photo of a bee-tree that I found and took to my yard and set up. It is six feet long and filled from end to end with comb, and probably honey and brood. It is curved away from the point of view and does not show the entire length, as I wished to show the bees and their entrance into the tree which can be seen at the lower edge of the cluster of bees.

I am of the opinion the bees have occupied this tree over at least one winter. As the hole was and is now at the top of the hive (or,

FRED J. CARTAN AND HIS BEE-TREE.

This bee-tree was found by Mr. Cartan and the section containing the bees was cut out and moved into his own yard.

rather, tree), I do not understand how the bees could retain the heat during cold weather.

I wish to transfer these bees to hives, and am in doubt as to the best plan. The colony is very large, about twice the size of a strong colony in regular hives, and would do good work if in hive and supers. Can I drum them out into the hive I am using as a super shown in the picture, or should I use Porter bee-escapes? There is a hole in the top of the log communicating with the super. I should like to save the queen, and can save most of the brood by putting the combs into supers on top.

My bees have done well this year. I had to feed through April and May to keep up brood-rearing, and at the first alfalfa flow the hives were running over with bees. The best colonies have 100 lbs. of surplus at present.

Medicine Lodge, Kansas.

[There would be no doubt about your drumming the bees up into a modern hive,

## SWEET CLOVER.

**Its Value as Pasturage for Cattle and Bees;  
Worth Four Dollars an Acre  
for Honey Alone.**

BY FRANK COVERDALE.

[In our last issue, p. 105, we published a report from Mr. Coverdale on the subject of sweet clover. We are glad to place this article also before our readers, since it gives some of his experience in regard to the value of sweet clover from a bee-keeper's standpoint—ED.]

The steers shown in the illustrations are part of a load shipped to Chicago Aug. 1, bringing \$5.75 per 100. During June and July they were fastened into this 35-acre field in which was a pretty good stand of sweet clover. This ground has been sown to this valuable legume for four years, and it seems to thrive better each year. No one who looks at this pasture and sees the cattle eating it and becoming fat has any doubt about its value as a pasture-plant. Most farmers think I am growing a vile weed; but they say it

CATTLE FEEDING ON SWEET CLOVER.

but you may have to pound pretty hard and continuously for a matter of twenty minutes or longer. If this does not succeed, bore a hole into the bottom of the cavity with an inch auger bit, and with smoke drive the bees upward into the upper box.—ED.]

---

A SPADE is a spade, and glucose is glucose, even if it is made from corn starch. If glucose is as good as its makers claim it is, there will be no trouble about selling it under the old name—*glucose*.

makes good feed for the cattle nevertheless. When I want to get rid of it after getting other fields started, I guess I shall have to plow up the field.

Sweet clover is certainly a great honey-plant, and this adds very largely to its value to the keeper of bees. It is also the very best clover to sow where a permanent and first-class grazing-field is wanted for dairy cattle, sheep, and hogs. I have not the least doubt of its permanency, because of its luxuriant growth through both wet periods and the drouths. It always furnishes a large quantity of nice green feed until the ground

begins to freeze in the fall. Even after it is frozen the stock do well on it if any is left.

I have 150 colonies of bees near this field, and it is a sight to see it when it is in bloom. The bees keep on filling the supers slowly with the honey, which is water-white, and very agreeable to most people. For me, this clover has yielded honey every season; but the bees do better on it at times. My neighbors keep some bees, so about 200 colonies work on it annually, and yet the field is worth from \$3.00 to \$5.00 an acre each year for the bees alone. I have made a very close study of this matter.

I think it will not be many years before these bees will have hundreds of acres of sweet clover to work on, and then I expect to see real results. I have seventy acres of sweet clover 20 miles from home, where I never expect to keep bees; for I want only a good rich pasture in this place.

A willow-tree once blew down and broke the fence so that my cattle walked right into my neighbor's hay-field. A ditch extended from my field into his, and the sweet-clover seed had been washed down until it grew along the banks in his field. This neighbor had told me he was afraid it would cover his farm; but my cattle found it that night, and ate it nearly to the ground without touching either the alsike or the timothy.

Maquoketa, Iowa.

[In a letter written later, to Dr. Miller, Mr. Coverdale made the statement that sweet clover is worth \$4 an acre for honey, \$15 an acre as pasturage for cattle, and \$30 an acre for seed, when the seed sells near home for \$10 a bushel. This makes a total of \$49 an acre,—ED.]

## A HOME-MADE HONEY-GATE

BY E. F. ATWATER.

Sometimes we need a honey-gate on very short notice; and, if not near a large supply-house, we hardly know what to do.

One day in September I made a brief call at the home and apiary of F. A. Powers and was at once interested in his home-made honey-gate. The general construction will be clear from the cut. It is made from 1½-inch lumber, about 4 inches wide. The block next to the tub or tank is cut out accurately to fit, and nailed on from the inside of the tank. On arriving home I needed

another strainer-tub; so I made one with a home-made gate, as shown in the cut. While this worked very well on honey at ordinary temperatures it was inclined to leak with

A HOME-MADE HONEY-GATE OPEN.

The block next to the can is securely nailed in position, the heads of the nails then being soldered to prevent leaking. The handle-block is bolted tightly to make a good fit.

HOME-MADE HONEY-GATE CLOSED.

hot honey. I then soldered over all the nail-heads and holes inside the tub, made a tin tube to fit snugly in the 2-inch hole, and soldered it neatly on the inside. But even then it is not so good as the regular gate, for *hot* honey; but for cold honey it works as well as one can wish, and will serve very well for temporary purposes, while the cost is next to nothing.

Meridian, Ida.

WE have just received the annual report of the Horticultural College, Kent, England. In this college only women are trained as professional gardeners and bee-keepers. A full bee-keeper's course is provided in connection with fruit culture. This shows very conclusively the close connection between the two industries, and it is true they are practically inseparable to a great extent.

DR. H. V. BUTTEL-REEPEN IN HIS GARDEN.

Dr. Buttel-Reepen is the author of "Are Bees Reflex Machines?" begun in this issue. He is not only a scientific man, but a practical bee-keeper as well. His work will therefore have all the more interest and value.—Ed.

## ARE BEES REFLEX MACHINES ?

**Experimental Contribution to the Natural History of the Honey-bee by  
H. v. Buttel-Reepen, Ph. D. Translated by Mary H. Geisler.**

### PREFACE TO THE ENGLISH EDITION.

For the English edition some additional references have been made to the important literature which has appeared on the subject since the publications of the German editions. On the whole, our knowledge has not materially changed since then. Modern animal psychology tends to discredit Bethe's reflex theory. Although the contradiction of this theory was taken as a basis for this paper, nevertheless it is concerned chiefly with the statement of experimental contributions to the natural history of the honey-bee; these contributions discuss the life and instincts of the community of bees, and incorporate some of the results gained by practical bee-keeping.

May this little paper gain friends on the other side of the ocean.

May, 1906.

BR. H. v. BUTTEL-REEPEN, Oldenburg, i. Gr., Germany.

### INTRODUCTION.

The following observations are submitted after fifteen years' study, and are further to be used for a General Biology of the Honey-bee; but this larger work can not be completed until later, because of the heavy demands on my time at present. It seems desirable to publish this much of the investigation now, however, and I wish specially to consider the most vigorously debated question of the day, that of the psychical faculties of social insects, because of Bethe's<sup>1</sup> interesting study of this question with regard to ants and bees. I shall take up bees only, as there are many scientific observations on ants<sup>2</sup> and as especially the great myrmicologists Aug. Forel<sup>3</sup> and Wasmann<sup>4</sup> have already overthrown many of Bethe's conclusions.

That I do not accept Wasmann's definition of Instinct will be apparent from what follows. I refer to the discussion of instincts in my "Stammes-geschichtlichen Entstehung der Bienenstaates, Leipzig, 1903, as well as to Forel's excellent paper, "Gehirn und Seele," 5. u. 6. Aufl., Bonn, 1899, pp. 34 and following.

As early as 1872, Dohrn<sup>5</sup> recognized that it would benefit science if more biological investigation were carried on, and the results made useful practically. It seems to me that

<sup>6</sup> A. Dohrn. *Der gegenwärtige Stand der Zoologie, etc.;* XXX. Bd. Preuss. Jahrb., 1872.

<sup>7</sup> The German word *Biologie* refers particularly to the study of life-history and habits rather than to all phases of animal and plant life—the sense in which it is used in English.—E. F. P.

the biological knowledge concerning *Apis mellifica*\* which has been gained by practical bee-keeping has scarcely entered scientific literature, and, strangely enough, the results are little regarded: it has not passed over into the flesh and blood of science. In proof of this there are the vague, defective assertions which are found in the newest editions of scientific works. Thus in a well-known text-book of zoology we read that a colony of bees contains about 10,000 workers. Such a small colony as that, 1 kilo of bees (5000 generally counted to a half-kilo) is not capable of developing under ordinary circumstances, nor of living over the winter. If a colony of medium strength is considered normal, then a normal colony contains at least 20,000 to 30,000 bees. The following statement also is wrong: "If a young queen emerges from her cell, then the former queen leaves the hive with part of the colony (first swarm) to found a new colony." Normally the swarm has issued by the time the cells containing young queens are sealed. Since it takes 16 or 17 days for the complete development of a queen, and the cell is closed on the ninth day, the hive is without an emerged queen for seven or eight days after the issue of the first swarm. The after-swarm, therefore, normally issues seldom before the ninth day after the issue of the first swarm. In Bechhold's *Lexikon der Naturwissenschaften*, 1894, there are similar incorrect statements. Among other things, a vigorous colony is said to contain, at most, 30,000 workers. But since strong colonies can sustain swarms of three or four kilos (27,000 to 36,000 bees), it follows that the whole number of inmates may amount to 60,000 or 75,000 and more, for usually a little more than half remain in the hive. Only 9000 swarming bees are counted to the kilo, because the honey-sacs of all are filled. Claus,<sup>8</sup> in a paper which contains many other errors, doubts that bees are able to hear. No zoologist who has done any experimental bee-keeping can have the least doubt that bees have an excellent sense of hearing, since observations yield him hundreds of proofs. The man who is not familiar with biological facts might recognize nothing of the kind with certainty, for up to the present the organ of hearing has not been discovered.

It appears, however, that the work of Otto Schenk indicates an advance in this direction (Schenk: *Die antennalen Hautsinnes-organe einiger Lepidopteren und Hymenopteren*, Zool. Jahrb., 1902). In this work on antennæ the presence of organs is demonstrated, which, with more probability than has been possible heretofore, may signify organs of hearing. Again, the work of Vitus Graber, "Die Insekten," München, 1879, in picturing the social life of insects, shows a series of errors and incorrect assertions so far as bees are concerned (Part II., 2d half, pp. 232-248). A refutation would take up too much space, and would lead me too far; but I might mention, for example, that Graber declares that the queen normally flies about inside the hive, because she "can not always pass *per pedes* through the vertical paths inside" (l. c., p. 88). Further, Wundt (*Vorlesungen über*

\* *Apis mellifica* L., or *Apis mellifera* L.? As is well known, the rule of priority begins as far back as the tenth edition of Linnæus' "Systema Naturæ," in 1758. In that year we find the honey-bee designated by Linnæus as *Apis mellifera*. Three years later he named it *Apis mellifica*, probably because he recognized that the name first given was erroneous, for the bee does not carry in honey but nectar, making the honey in the hive. It is, therefore, not a carrier of honey (*mellifera*), but a maker of honey (*mellifica*). Be that as it may, the first author himself undertook the correction after a short time. Then developed an overwhelmingly rich literature concerning *Apis mellifica* (not *mellifera*), which is now inexhaustible, even to the specialists, if the non-scientific literature on bees be included. The bibliography of the late Mr. Edward Drory, of Berlin, relative to the honey-bee alone, embraces, for example, more than 2500 works. In the catalogue "Elenchus Librorum de Apium Cultura," Bibliographia Universale de Apicultura, raccolta per Augusto Keller, 2300 works on *mellifica* are cited.

Under the circumstances Friese (as writer on Apidae for the *Tierreich*), and I have thought that, in spite of the rule of priority, we would not be justified in reestablishing the name "*mellifera*," which was recognized as incorrect, and shortly rejected by the first author. This is the result of mature deliberation at various times during many years. Not only were the reasons just mentioned arguments for retaining the name adopted 150 years ago, but also the knowledge that its establishment proves how powerless the regulations of the priority rule itself are in definite cases. They are powerless in spite of the rules for the "*Tierreich*," in spite of Della-Torre's "Catalogue Hymenopterorum," and even in spite of Friese and others of the originators of the priority rules for each case. For example, for the genus of solitary bees "*Anthophora*," the name "*Podalirius*" was introduced, or at least according to the new system an attempt was made to introduce it. But here the case was like that of *mellifica*—the first author himself, for certain valid reasons, changed the name after a short time from "*Podalirius*" to "*Anthophora*." Thus the name *Podalirius* did not prevail. It has not succeeded in becoming established in the lapse of years, and there is not the slightest probability that it will change in the future. I quote this discussion from my work which has just appeared, "Apistica. Beiträge zur Systematik Biologie, sowie zur geschichtlichen und geographischen Verbreitung der Honigbiene (*Apis mellifica*, L.), ihrer Varietäten und der übrigen Apis-Arten." Mitth. d. Kgl. Zoolog. Museums in Berlin, 1906.

<sup>8</sup> Claus, Der Bienenstaat. Part 179 of the collection of scientific papers published by Virchow und Holtzendorf. Hamburg 1873.

die Menschen- und Tierseele, Leipzig, 1892), builds numerous far-reaching theories upon an incorrect biological basis. I shall speak of this in my "Conclusion" to this paper. The foregoing list of errors is not very complete, but let the matter end here.

While the founders<sup>9</sup> of our present knowledge in this sphere depended largely upon the results gained in practice, we see now and then an almost complete ignorance of the rich material which distinguished bee-keepers have laid down in the literature of practical bee-keeping.<sup>10</sup>

As to terminology, I shall not use Bethe's phrase, "psychic qualities" (psychische Qualitäten), since it can be interpreted in various ways. Bethe gives it a definite significance, comprehending under it everything acquired in the life of an individual, and also every capacity for sensation and learning; in short, everything that transcends unperceived reflex activity.<sup>11</sup> He considers ants and bees as mere reflex machines: "It seems to me that these insects have no senses, have no ability to make experiences and modify by it their actions; that all stimuli remain below the threshold of perceptible sensations and perceptions; and that they execute, in a purely mechanical way, all the apparently reasoned actions" (Bethe, l. c., p. 98). Whether this view is warranted, we shall see further on.

The terms "reflex" and "instinct," I shall use in the significance Bethe gives to the word "reflex." Instinct is complicated reflex.<sup>12</sup> He lets pass as reflex the inherent faculties; the course of nervous processes is determined by inherited instincts. That acquired in the life of the individual shows the opposite; here the course of the nervous processes indicates experience, memory, learning, capability for association, etc.<sup>13</sup> I shall restrict myself here to these short statements, but shall add some psychological views in the concluding chapter.

I shall first discuss the "Hive Odor" and reactions resulting from it, then give my experiments and opinions on the capacity for intelligence in bees, and end with my conclusions concerning the homing instinct in bees, or the ability to find the hive, etc.

### THE HIVE ODOR AND THE REACTIONS RESULTING FROM IT.

In the first section of "Investigations on Bees," Bethe (l. c.) treats the question as to how bees recognize the hive, and concludes that the recognition results solely from an odorous chemical compound (Geruchsstoff) which he calls the "hive substance" (Neststoff).<sup>14</sup> He avoids the term "hive odor," because he thinks bees have no sense of smell.

<sup>9</sup> François Huber, *Nouvelles observations sur les abeilles*. Geneva, 1814; German by G. Kleine, Finbeck, 1856; English editions in 1823 and 1841. This investigator, blind since his twentieth year, could not have carried on his observations without the help of his unusually efficient bee-keeper Burns.

<sup>10</sup> Siebold *Wahre Parthenogenesis bei Schmetterlingen und Bienen*, Leipzig, 1856, etc.  
<sup>11</sup> Leuckart, *Zur Kenntnis des Generationswechsels und der Parthenogenesis bei Insekten*, 1858, etc. Surely the histological findings of these last-named investigators with regard to the presence of spermatozoa in bee eggs can no longer be esteemed as free from objections. They doubtless depend upon an illusion, for, as I have shown before (*Die Befruchtungsvorgänge im Bienenstadium*, *Bienenw. Centralblatt* Nr. 16, v. 15, August, 1899; further in *Aus den Wundern des Bienenstaates*, *ibid*, 1900), according to my investigations, the spermatozoa undergo the transformation into sperm nuclei in about 15 to 20 minutes (cf. Weismann, *Vorträge über Deszendenz Theorie*, II. Aufl., 1904, p. 250, I. Bd.); while v. Siebold says he has seen living spermatozoa in eggs after 12, 15, and 22 hours. I believe, therefore, that in Blochmann's paper (*Ueber die Zahl der Richtungskörper bei befruchteten und unbefruchteten Bieneniern*, *Morphol. Jahrb.*, 15 Bd., p. 85-96, 1889), and in Paulcke's investigations (*Zur Frage der parthenog. Entstehung der Drohnen (Apis mellif.)*, XVI. Bd., pp. 474-476, *Anat. Anzeiger* v. 5, October, Jena, 1899, *Vorläufige Mitteilung*), we have the first safe histological corroborations of the theory of parthenogenesis in the honey-bee. In the meantime Petrunkevitch has given full confirmation (cf. *Petrunkevitch, Alex., Natural and Artificial Parthenogenesis*, *Amer. Naturalist*, Vol. 39, 1905).

<sup>12</sup> v. Siebold (l. c., p. 57) expressly refers to the findings of bee-keepers as "the most important work."

<sup>13</sup> Bethe drops this expression in "Beer, Bethe, and J. v. Uexküll, *Vorschläge zu einer objectivirenden Nomenklatur*, *Biol. Centralbl.*, 19 Bd., 1899, Nr. 15, p. 517 (also in *Centralblatt für Physiologie*, 1899, Nr. 6); further in Bethe's "Noch einmal über die psychischen Qualitäten der Ameisen," *Archiv. f. d. ges. Physiologie*, Bd. 79, 1900, p. 45.

<sup>14</sup> H. E. Ziegler, *Ueber den Begriff des Instinkts*. *Verhandl. d. deutsch. zoolog. Gesellsch.*, 1892.

<sup>15</sup> H. E. Ziegler, *Theoretisches zur Tierpsychologie und vergleichenden Neurophysiologie*. *Biol. Centralbl.*, Bd. XX., Nr. 1, 1900.

<sup>16</sup> According to Bethe we must consider the existence of this "hive substance" as a "family odor." "I believe that these family odors, common to all the members of one family, and differing slightly from those of other families of the same species, play an important part in the life-history of the social hymenoptera. This family difference is due to the varying proportions of the constituent odors" (l. c., p. 81). This "hive substance" must be inherited, as Jäger likewise maintains (*Zeitschrift für wissenschaft. Zoologie*, Bd. 27, 1876, p. 327). I might mention here that I find no proof in Jäger's paper that he concludes the "exhalation odor" of a colony to be solely a "family odor" as Bethe does, and still less proof that he considers this common odor to be "inherited," because it is a mixture of many thousands of inherited individual odors.

Bethe includes, under the term "hive substance," two separate substances, one giving the family odor and the other causing the "various reactions toward hive mates and hive strangers." That this conception will not cover all cases, I believe I can demonstrate in the course of my paper.

I use the expressive term "hive odor" (colony odor, exhalation odor), under which I comprehend only the existence of gaseous substances disseminated in a colony, the presence of which is detected by the bees' sense of smell.

I believe that the following odors are present in a colony of bees:

1. The Individual Odor. It can be easily demonstrated that the queen odor (see p. 7) varies with different individuals, and on the same ground (germinal variation), an individual odor should be assigned to the workers.

2. All offspring of one mother (queen) have a common inherited family odor in addition to the individual odors, belonging only to the progeny of one queen.

3. The brood and chyle odor (p. 9).

4. The drone odor (p. 10).

5. The wax odor. Since the wax is a glandular secretion, an exuded product, it may be safely taken for granted that, considered apart from the specific odor of wax, the individual odors of the wax-generators adhere to the honey-comb. Accordingly the wax structures of different colonies have different odors.

6. The honey odor. That the honey of each colony (mixed with a secretion of the salivary glands) has its specific odor is readily seen from the old practice of bee-keepers to which Bethe also alludes. If a queen be daubed with honey from a queenless colony, she will be accepted readily by that colony when inserted.

7. The hive odor (exhalation odor, colony odor). The hive odor is composed normally by a mixture of the preceding odors, or of some of them. Single bees, therefore, besides their individual odors, possess the family odor and especially the common adhering hive odor, which forms the dominant factor in the various actions toward hive mates and hive strangers—that is, in mutual recognition between bees.

If a strange queen is put into a queenless colony in a cage, a confinement of twenty-four hours is usually sufficient for the queen to have received the "hive substance," as Bethe calls it; that is, she has become "scented."<sup>15</sup> The external adherence of the colony odor therefore suffices to make the bees permanently friendly with the foreign queen. If a swarm is made of the bees hanging in front of several hives,<sup>16</sup> which in strong colonies often form great clusters (beards), by scooping them up in a ladle, there will probably be bees from ten, twenty or thirty different hives. If they are put into a hive and given a queen, with the observance of proper precautions, these bees from let us say, thirty different hives, form a peaceful colony in a few hours, which adjusts itself in its new dwelling and takes up the ordinary tasks of the day. Here we have thirty family odors, and about thirty to forty thousand individual odors united into a special hive odor, peculiar to this colony alone, merely by the scooping together. The proof of this can be found in the fact that a queen placed in such a colony can be set free frequently after only twelve to twenty-four hours; she has taken up the hive odor.

We see, therefore, in this case, a colony without a specific family odor conducting itself exactly like colonies which are made up of the offspring of one mother. In each case the hive odor is formed by the union and mixing of individual odors.

Now the question arises: Is this hive odor inherited? No, surely not, for the hive odor, therefore the common odor, that each individual can take up in an external way is something purely exogenous or acquired.

The power of the hive odor seems to me, therefore, to lie not in the inherent family odor nor in the inherited individual odors, but in the exogenous mixture of the two. What Bethe (l. c., p. 43) alleges for compound nests (Schüttelnester), and communicates in his experiments on bees (p. 71), is not a contradiction of this. He says that bees that had been transferred to another hive did attack almost not at all or with only slight enmity their sisters remaining in the mother hive because the common family odor lessened the hostile reaction. This proves merely that the hive odor differs from the family odor. If the latter were the predominant factor, bees of the same family would always be friendly with each other, which is not the case.

<sup>15</sup> Further on I shall show that in many cases the bees very likely become familiar with the odor of the queen, which is a mixture of the queen odor and the hive odor.

<sup>16</sup> G. Dathe, Lehrbuch der Bienenzucht, 5 Aufl. Bensheim, 1892; Bienenzeitung, 7 Jahrg., No. 19.

Further, I can not regard this, the only experiment which Bethe employed (l. c., p. 71), as conclusive, since very many circumstances which have nothing to do with the hive odor effect the friendly or hostile attitude of bees, be they sisters or strangers. The forage, weather, time of year, strength of the colonies, quantity of provisions, etc., all have an influence, as is well known to those who have studied the peculiarities of bees for many years. In my experience, estrangement seems to take place between separated hive mates generally much more quickly than Bethe states, yet I think this is on the whole a secondary matter which does not touch upon the principal point.

#### MODIFICATION OF REACTIONS TOWARD THE HIVE ODOR.

It is contested by Bethe that the "various reactions" are based upon hive-mate and hive-stranger modifications.<sup>17</sup> It seems to me that it is hardly possible to grant such a far-reaching conclusion when Bethe's investigations give no striking proof that reactions toward the hive odor are incapable of modification. We learn nothing from the illustration given above. In the critical examination of robbing between colonies, we find that a great number of factors enter, which can be discovered only after years of keen observation and fortunate circumstances. In the manual of bee instruction which I helped to publish<sup>18</sup> (see p. 9), I recommended also fumigation of the hive of the robbing and not of the robbed colony, but that is no proof that the hive stimulus can not be modified. Bethe believes that no psychic elements enter into the actions of a colony and apparently the short time he could devote to bees led him to this view. I submit the following investigations on this question.

#### THE SWARMING-OUT OF A QUEENLESS COLONY.

If two hives are placed close together, and the queen and brood are removed from one, it sometimes happens that the entire colony, from which every possibility of rearing a queen has been removed, will enter the queen-right<sup>19</sup> (*weiselrichtigen*) colony, humming "joyfully." These bees seldom sting, and are received in a friendly manner, although the normal queen-right colony should react hostilely, if it followed a chemical reflex incapable of modification. What causes this swarming-out of the queenless colony we shall see further on.

#### INTENSIFYING THE REACTION.

If a colony tolerates robbing without attempting to suppress it, a stimulating food should be given it, such as fermenting buckwheat honey<sup>20</sup> several years old or a mixture of honey and brandy, and the hive should be shaken to arouse the anger of the bees, etc. Then a better defense is made, the irritability of the colony is increased, and robbers are better recognized and repulsed.

The "courage" and the "attention" of the colony are increased, and therefore we have intensified reactions toward hive strangers.<sup>21</sup>

<sup>17</sup> "It has been thought possible to make the individuals of a hive 'recognize' each other better by fumigating the colony with some strong smelling substance—camphor, naphthaline, baldrian, for instance. If this be done to a colony exposed to frequent plundering it is thought that the bees of this hive will more readily detect the robbers to whom the scent does not adhere. Were this correct, then it would prove that the various reactions toward hive mates and hive strangers could be artificially modified.

"I believe that I can assert positively that such treatment does not increase the reaction toward strange bees in the least, but only that the bees of all strange colonies react more vigorously toward the individuals thus scented. (Therefore if it is desired to defend a colony from robbing, it is the robbing and not the robbed which must be fumigated.)

"We see, therefore, that here, as in ants, the various reactions toward hive mates and hive strangers bring us back to a simple chemical reflex" (Bethe, l. c., p. 71).

<sup>18</sup> G. Dathe, *Lehrbuch der Bienenzucht*, 5 Aufl., published by R. Dathe and H. Reepen (v. Butteler-Reepen), Bensheim, 1892, p. 181.

<sup>19</sup> There is no word in common use among English-speaking bee-keepers to indicate the normal condition of a colony in the possession of a queen, either mated or unmated. It seems desirable, therefore, to translate the German term literally, although "queen-right" is an undesirable term. It has already been used by some American writers.—E. F. P.

<sup>20</sup> Dathe, l. c., p. 179.

<sup>21</sup> The Lüneburger bee-keepers sometimes employ a particular method for putting a stop to robbing. If the honey-flow is strong, so that the powerful odor of honey issues from the hive-entrance, a general robbing occasionally goes on; but the robbers are hardly noticed by the bees of the hive, apparently the strong odor of honey covering the strange odor of the robbers, or the certain, quiet entrance deceiving the inmates of the robbed colony. In order to call out a stronger reaction, the bee-keepers turn over the skeps so that the wider opening of the skep is turned to the front. One would think that, since the whole honey-comb is now open to the air, robbing could be effected more easily; but this is not the case, for the powerful odor of honey is now easily "dissipated," and the robbers, because of the change in the position of the entrance, are uncertain, and hesitate. Thus the attention of the colony is drawn to the robbing, the fortification is well protected, and every attack is beaten off (cf. G. Lehzen, *Hauptstücke der Lüneburger Bienenzucht*, 1900, Hannover).

## OVERCOMING THE REACTIONS TOWARD HIVE ODOR.

It is interesting that this powerful reaction toward hive odor, though generally acting hostilely, can be subdued and turned in other directions. Thus bees which blunder into the wrong hive, as they return from the fields with filled honey-sacs, are seldom attacked.

The behavior of such "begging" bees is most peculiar. With the abdomen dragging on the flight-board, the proboscis far extended and dealing out the honey to her tormenters, she is trying to insinuate herself into the hive in order to deposit her honey, and in this she often succeeds. (Here and further on I use anthropomorphic terms for better demonstration. It is understood that many of these actions rest upon reflexes and instincts, but it makes the case clearer to use such terms, as "to insinuate" for example.)

The old practice of transposing hives is based on the fact that strange bees, laden with honey, are received in a friendly way. If a weak colony needs improving, it may simply be put in the place of a very strong one, the two hives changing places. This transfer will be successful only on days in which there is a good honey-flow and all flying bees return heavily laden. If the hives have the same outward appearance, and (most important) have their entrances at the same height, almost all bees will fly in as usual. Thus the weak colony will be strengthened from the strong one, and stinging seldom occurs.

Also, if one wishes to prevent swarming, the flying bees may be drawn off in the same way. I can not at this point go into the many modifications of this practice, and must refer to the manuals of instruction.

If a strong colony stands next to a weak one during a rich honey-flow, and succeeds in filling its own chamber to overflowing, it happens now and then that the strong colony, having no further room, will help to fill the hive of the weak one in the most peaceful way. So we see that of two colonies which should react hostilely toward each other, either one or both may be put under peculiar conditions in order to handle both in the same way with a peaceful reaction between them. For example, if two colonies are sprinkled with some strong-smelling liquid, or powdered with meal, they may be united without risk.

If bees are stupefied with saltpeter, chloroform, ether, or puff-ball, the same thing can be done with no danger of mutual stinging, but at the same time the earlier orientation is completely lost. When the bees recover from their stupor they no longer recognize their own colony, and can be united to other colonies at will. What conclusions are to be drawn from this capacity for learning, etc., we shall see later on.

Incidentally, I might mention here a curious aberration of instinct. The literature of bee economics records some cases in which bees showed unaccountable hostile reaction toward their own hive mates. Thus it has been observed some times that a colony will sting a great number of its own flying bees as if they were intruders. This behaviour has been noticed for a long time, and it finally did lead to the destruction of the colony. Possibly here there is a degeneration of that instinct which causes colonies to place bees at the entrance to control the flying in. Perhaps differences of odor come into account, or perhaps both stimuli act together.

It is probable, too, that we may be dealing with defective observations, although errors of instinct in bees are not at all uncommon, and frequently in the spring it can be proven that bees, in an inexplicable mistake, even attack their own queen and ball her. The colony is then in wild confusion, and between the combs or on the bottom-board is the poor queen in the middle of a cluster of bees; she often comes out of the tumult a cripple. Another case of failure in instinct is as follows: As is well known, bees now and then build queen-cells over drone eggs.<sup>22</sup> If a queen-cell is of more than ordinary length it is tolerably sure to contain a drone larva.<sup>23</sup> The too invigorating royal jelly<sup>24</sup> seems to be unwholesome

<sup>22</sup>O. vom Rath, Ueber abnorme Zustände im Bienenvolk. Berichte der Naturf. Ges. Freiburg i. Br., 8. Bd., 1894.

<sup>23</sup>There is also a prevalent idea that such cells are not as rough as normal cells containing queens; some books on bee-keeping even go so far as to try to figure the difference.—E. F. P.

<sup>24</sup>Concerning the varied chemical composition of pabulum for the three kinds of bees, see A. von Planta, "Ueber den Futtersaft der Bienen," and "Nochmals über den Futtersaft der Bienen," Schweiz. Bienenzeitung, 1888-'9; further, A. von Planta, Zeitschrift f. phys. Chemie von Hoppe-Seyler, 1888, Bd. 12, Heft 4, pp. 327-354, and also Bd. 13, Heft 6, pp. 552-561; further, Dathe l. c., p. 24.

for the larva; it falls out from the food because of the abnormal size of the cell, and that is the cause of their always lengthening the cell. Usually the drone dies.

#### THE ODOR OF THE QUEEN.

The individual odor of the queen is doubtless in many cases a very small part of the odor of the hive, but often may form the dominant factor. The exhalation of the queen is so intense that it can be perceived by man. It is very characteristic and adherent, being somewhat like the odor of thyme. If a queen is crushed on a board, the bees of her colony smell for several days around the place where she was killed. If the bees are allowed to run over the board, they gather there; and, lifting the abdomens, fan their wings in a peculiar way.

It often happens that after-swarms, also swarms with young queens, fly together and unite into a powerful swarm-cluster. The bees in this cluster do not attack each other, in spite of the varied hive odors. The "swarm-dizziness" extinguishes the reactions toward the foreign hive odor, just as it also almost destroys the sense of orientation, so that the impulse to seek the parent colony is lost,<sup>25</sup> at least under normal circumstances. The swarming bees, instead, remain in the home they have taken up; the field bees, which some days before, or immediately before the swarming, have been bringing honey, pollen, and water to the parent colony in the usual way, will, a few hours later, after they have become oriented, bring their burdens into the new hive. Under the proper conditions this can be placed adjoining the old one. The memory of the old birthplace has completely disappeared. I shall speak later on of an exception to this.

If it be wished to separate these united swarms, the whole cluster may be put into a large box containing as many twigs of a tree as there are swarms. Over night the colonies separate of themselves, each hanging on a twig.

It is safe to take for granted that a purely mechanical separation takes place here, and, evidently, according to the various hive odors. I nevertheless believe that a still more powerfully determinative stimulus enters—the odor of the queen. Each colony congregates around its queen;<sup>26</sup> and if the queen is taken away from one swarm it will unite with another possessing a queen, in spite of the hostile hive odor.

It may be thought that here the family odor, the possession of all the offspring of one mother, enters its claim; but I notice that the swarms may be united ingeniously, even if the queen does not originally belong to the colony in question, but comes from a queen-cell taken from a strange colony. In addition, we continually have to do with unfertilized queens in normal after-swarms, therefore we can not speak of the offspring of one mother at all. The queen of an after-swarm is the sister of the workers, if I may so express myself.

It is the queen odor familiar to the bees which acts with the hive odor (to be sure, the reaction toward the latter seems to disappear during the swarming), and perhaps holds the community together, but the queen odor is the dominant factor. This may be seen from the first experiment (p. 5) also, to which I shall now return. The bees of the queenless colony scent the queen in the neighboring hive, and, paying no attention to the foreign hive odor (toward which, under ordinary circumstances, they would react sharply), they go over into the enemy's camp "humming joyfully." Very probably sound perceptions also come into consideration—that is, the reaction toward the humming of the "queen-right" colony (see later).<sup>27</sup>

If the odor of the queen is so powerful, it is clear that this individual odor alone

<sup>25</sup> Bethe, in dealing with the "psychical qualities," has not considered either the act of swarming, which is an all-important factor, or the individual odor of the queen. We shall see presently what interesting bearings swarming has on this question.

<sup>26</sup> Some may take exception to this statement, perhaps, and believe that this gathering together is due to other instincts—the sex instinct or the instinct to swarm which is characteristic of bees; but it must be kept in mind that the bees separate into single colonies only if the queens of the various colonies are present, manifesting their presence by the scent which exhales from them.

<sup>27</sup> In this there might be found an apparent contradiction to the "disregard of the queen" (p. 14). The finding of the queen in the next hive is not by scenting from hive to hive, for the distance is too great. The agitated queenless bees run searching over the front wall of their hive and also over the front wall of the one standing next. In this way some come to the entrance of the neighboring hive, where the odor of the queen and the sound of contented humming are issuing forth. At once they begin to lift the abdomens, and fan with their wings. Their mates near by take up the humming, and soon the whole colony enters the queen-right hive in order, with lifted abdomens and fanning wings.

determines the special character of the hive substance, especially when this is particularly strong. This would happen in the spring during the increased sexual activity<sup>29</sup> which is demonstrated by the enormous number of eggs laid (2000 to 3500 and more in twenty-four hours). That it is not always the determining factor, follows from the fact that there remains a hive substance capable of causing reaction, even if the queen is taken out and kept at a distance.

At such a season, during the strongest breeding period, the bees care for the queen with special zeal. It may not be the very "sympathetic" odor<sup>30</sup> alone which causes them at this time to surround her in a close cluster, for her increased need of nourishment<sup>30</sup> increases the constant care of the bees around her. Nevertheless, the singular pleasure that bees take in the strong mint-like exhalation from the queen is shown in the attachment of the "court," this affection being demonstrated by the single "courtiers," who from time to time lick the abdomen or thorax most zealously, humming continually in a characteristic "contented" way.<sup>31</sup>

The bees wish to sniff the odor, so to speak. A queen in an observation hive can be seen constantly surrounded by a circle of brood nurses who continually turn the head to her. If she advances slowly, the bees yield the way, moving backward. From time to time the "caressing," licking, and feeding go on. It can be easily understood how this attitude has often been interpreted as the expression of a peculiar reverence toward the "ruler of the community." The "respectful" walking backward, the "tender" licking, the irreproachable service (as the queen never leaves the hive, she is forced to deposit her fæces in the hive, and the "courtiers" immediately clean away all traces) closely approach anthropomorphic appearances. But perhaps it might be proven that the individuality of the queen is the dominant factor. A foreign queen with the same strong odor of mint would be stung in spite of the pleasure in the smell.

In autumn and winter, also early in the spring, the bees concern themselves relatively very little with the queen, and still less with a young virgin. The lessened exhalation (it is as yet very weak) may explain this phenomenon in part.

It seems to me that if the odor of the queen is extremely penetrating and adherent,<sup>32</sup> as it doubtless is, the view (mentioned also by Bethe) that the queen takes on the hive odor of the queenless colony in which she is placed in a cage, is not correct in all cases, for the colony is "scented" by the strong odor of the queen, which is distinctly perceptible to our sense of smell. Very rightly, therefore, O. vom Rath<sup>33</sup> says that "the workers first accustom themselves to the odor of the queen." The stronger, then, the exhalation from the queen, the more easily must be her acceptance or, the scenting of the colony proceed; and consequently the mutual friendliness also. I find from many investigations that a mated queen heavily laden with eggs is more easily accepted than an unfertilized one. The following rules<sup>34</sup> of bee-keeping harmonize with this statement: 1. "An unfertilized queen is not accepted by many colonies if formerly they have had a fertilized one." 2. "The older a queen is, the more readily is she accepted." 3. "Weak colonies accept queens more easily than strong ones." 4. "Queens of the same kind are accepted with less difficulty than those of different varieties; as for example, Italians, Caucasians, Cyprians, etc." Here in every case the different odor of each variety plays its part.

It may seem obvious that it is easier to demonstrate this scenting, whether it be on only one side or mutual, with a weak colony, but here other instincts come into consideration too, as we shall see further on.

<sup>29</sup> Jaeger, Ueber die Bedeutung des Geschmacks- und Geruchsstoffes. Zeitschrift f. wissensch. Zoologie, Bd. 27, p. 327, 1876.

<sup>30</sup> In order to keep a swarm in the hive, the hive may be rubbed with thyme.

<sup>31</sup> As is well known, the queen can eat only honey independently; but the probosces of the workers are necessary to feed her with nitrogenous food.

<sup>32</sup> I might say again that anthropomorphic designations are chosen for purposes of clearer demonstration.

<sup>33</sup> I took the queen from a strong colony, put her in a cage, and after a few minutes removed her. Fifteen minutes later I placed the empty cage upon the flightboard of the colony concerned. Immediately the bees scented the odor, and alighted fluttering upon the cage, which they had completely ignored before (see also p. 7).

<sup>34</sup> O. vom Rath, Ueber abnorme Zustände im Bienenvolk, Berichte der Naturf. Ges. Freiburg i. Br., 8 Bd., 1894.

<sup>35</sup> Dathé, l. c., p. 311.

## THE BROOD ODOR.

It is highly probable that it is not only the odor of the queen at all times which causes a queenless colony to enter a hostile camp (see p. 5), but during the months of greatest increase, from March to June or July, a powerful constituent of the hive odor is the odor of the brood, a warm characteristic vapor exhaling from the thousands of brood-cells. The chemical processes going on at this time in the cells, for the development of the larvæ, are of so intense a nature that a temperature of 28 to 32° C. is maintained in the brood-chamber. On spring days this exhalation from the brood, which smells like freshly baked bread, may be perceived some distance away in the direction of the wind. Very probably this strong odor sets free the same reaction in queenless and broodless colonies as the queen odor does; but as such colonies always go over to the queen-right colony, even if there is no brood at all or only a minimum amount, so in spite of this vapor from brood and pabulum (the larvæ swim in food), it is very likely the queen odor and the humming of the queen-right colony which are of first importance.<sup>25</sup>

But, on the other hand, the attachment of the bees to the brood is very strong, as may be seen from the fact that an unruly swarm, which has already withdrawn from one unaccepted hive, will certainly remain if a frame of brood is hung in it. Again, swarms can often be enticed from an undesirable place for capturing them (the middle of a hedge, for example), by means of a frame of brood.<sup>26</sup>

## THE INDIFFERENT ODOR OF YOUNG BEES.

Young bees, particularly those just emerging, have an apparently faint and indifferent odor, and they are, therefore, not attacked in a strange colony; the same thing is true of young queens. In cutting out queen-cells, it happens repeatedly that the young queens which are entirely or nearly "ripe" free themselves from their compartments. If such a queen is immediately allowed to run through the entrance of a queenless colony, the queening is usually successful. This depends, perhaps, upon the fact that, as described, the individual odor is not yet developed, analogous to the similar indifferent "infant odor," and that the common reaction-loosing hive odor has adhered but little so far. It is curious that there are colonies which will not allow themselves to be requeened;<sup>27</sup> then all artifices are in vain.

However, in the winter months, when the bodily functions which determine the intensity of the individual odor are for the most part quiet or weakened, the strength of the individual odor decreases. In consequence of this we have prompt friendliness with strangers, since the lessened odor of the hive excites only a weak reaction. Therefore a union of colonies can be undertaken in early spring without observing the precautions otherwise necessary.

I noticed one day a change in two hives standing close to each other, which was totally unintelligible to me. Colony "A," in which a vigorous increase was to be expected, showed a constant diminishing of numbers, while colony "B" strengthened in a surprisingly short time. By good fortune colony "A" was of the native brown variety, and colony "B," a yellow Italian hybrid. This color distinction of the varieties, which has helped to solve so many mysteries of the domestic economy of bees, brought the explanation in this case. I was soon sure that colony "B" was taking up the young from the other hive, and I found out how after long observation. A passage through possible crevices could not take place, nor could the crossing be from one alighting-board to the other; therefore only the flying bees had to be taken into consideration. I noticed after some time that the young Italian bees always took their flights of orientation earlier than their neighbors. Now, when a thick cloud of these young bees, humming loudly, would be flying in front of colony "B," the native colony would gradually begin to send out bees for orientation, but its mass of humming bees was always considerably smaller. This was because many bees, attracted by the loud buzzing, immediately plunged into the neighboring tumult, there oriented themselves, and accordingly entered colony "B" thereafter. There they were

<sup>25</sup> The "constancy" of bees to their queen, which is always the dominant instinct, manifests itself in a starving colony by the fact that the queen is always the last to die; she is fed to the end by the dying bees. In order to confirm this, I put a queen with a few bees and very little food into a box covered with wire gauze. After forty-eight hours the bees were very weak; two days later only four were still alive; the next day but one was living, while the queen was apparently as vigorous as ever. The last surviving worker lay on its side unable to crawl; but when the hungry queen approached demanding food, it tried feebly to join its proboscis to that of the queen in a vain attempt to give her food. Finally the queen turned away; and when I looked again, half an hour later, the last worker was dead, but the queen showed no sign of weakness. I then put her back in the colony.

<sup>26</sup> Dathe, l. c., p. 225 and 230.

<sup>27</sup> Bienenwirtsch. Centralblatt, Jahrg. 28, Heft 19, p. 298, 1892.

accepted on account of their indifferent odor, and chiefly, perhaps, because of their entirely "harmless" conduct.

#### FAILURE OF THE HIVE-ODOR REACTIONS IN QUEENS AND DRONES.

It is of interest that the hive odor of a strange colony causes no reaction at all in a queen. Queens never react either peacefully or hostilely toward strangers or toward bees belonging to the hive. They demand nourishment from every bee, and may maintain themselves even in the most hostile colony as long as it is queenless. Even the "angrily" buzzing bees which besiege the queen-cage in a solid mass, and which try to bite and sting the queen through the wire cloth, put the required food into the extended proboscis of the queen. In this manner a queenless colony will often feed ten or twenty confined queens; but if one should accidentally free herself and be accepted by the colony, then the bees will let the rest starve.

The queen recognizes as an enemy only her "rival," even if reared in the same colony (daughter or sister), and who, therefore, must have the same family and hive odor. If two queens come upon each other, only one will remain on the battlefield.<sup>33</sup>

If the queen is pleasing to every bee in every colony, the same thing may be said of the drones, who are extremely cosmopolitan, and who loaf about from hive to hive, and in consequence, apparently, of their specific odor, they are received peacefully everywhere, provided, of course, that the killing of the drones has not yet begun. At no time do they display the smallest response of any kind toward other bees, except when they accomplish the object of their existence in the mating-flight.

#### ABNORMAL HIVE ODOR.

It is worthy of note that drone-producing (fertile worker) colonies, that is, colonies in which the workers take to egg-laying because a queen is lacking, and on account of lack of brood, are not only difficult to requeen, but also equally difficult to unite with queen-right colonies. This is doubtless in consequence of the peculiar hive odor called forth by the presence of so many egg-layers whose number increases the longer this abnormal condition lasts. According to the investigations of Dönnhoff, almost all the bees finally lay eggs without conducting themselves differently from the usual non-laying bees.<sup>34</sup> A true queen odor does not seem to develop, and I have observed that drone-laying queens are never rendered the "homage" which a normal queen receives. As long as she is unfertilized, she seems to be unnoticed by the inmates of the hive; but as soon as she begins laying eggs she has around her constantly a ring of "courtiers" (see p. 7). Other colonies very frequently may be united without special precautionary measures, but not so with fertile-worker colonies, which can be joined successfully only by the application of very special precautions.<sup>35</sup> We therefore have here an abnormal hive odor of a peculiar kind.<sup>36</sup>

In any case it is evident from the foregoing that the hive odor is exceedingly complicated—much more so than would appear from Bethé's account; and the idea of a simple chemical substance and a chemical reflex, incapable of modification, is not enough to clear up the proceedings which are involved.

<sup>33</sup> The queen is normally the absolute "monarch" in the colony; but in spite of that we not seldom find cases where there are two egg-laying queens. Here we have the successor encroaching upon the old decrepit queen before the latter dies. But under such circumstances there are always two brood-nests—the queens do not come together. The following observation stands alone, and is the more remarkable because it has to do, not only with two queens, but with two of different varieties. "Since I had the opportunity," writes one Mr. Breuer, in the *Rheinischen Bienenzeitung*, "to obtain a purely mated Carniolan queen, I took out the old queen on July 17th, and put in the Carniolan. She was accepted without delay and immediately began laying. Another queen was positively not present in the colony. The brood developed quickly, but I kept noticing among the young bees Germans as well as Carniolans. When I revisited the hive I found upon the same frame, hardly five centimeters apart, two magnificent queens, peacefully together—one German, the other Carniolan. The brood-nest was not divided, but just as normal as if the eggs had all been laid by one queen." (See reference in *Bienenw. Centralblatt*, No. 22, 1899. Hannover.)

<sup>34</sup> *Bienenzeitung*, XIII. Jahrg., No. 20. In passing, I might submit the following: It has been shown experimentally that, as in the circumstances cited, the workers (normally sterile) take up egg-laying. I shall here mention only one such investigation, and shall not take up the various anthropomorphic explanations which are usually given. There is a wide-spread view among bee-keepers that the larvæ of workers which are located nearest to the queen-cell are fed occasionally on royal jelly by mistake; on account of this exceptional nourishment, it is believed that a better development of the ovaries may take place. This view is held also by v. Siebold and Huber. (The ovaries of workers normally consist of about twenty to thirty egg-tubes, whereas those of the queen contain about four hundred.) Parallel with and partly qualified, by this view is the incorrect idea that there is only one or a few egg-laying bees in a drone-producing colony; but if one realizes that almost all workers in such a colony lay eggs, this view is already weakened. In my opinion we here have to do with the same reflexes which induce a colony to produce a young queen during the lifetime of an old weakened queen that is laying eggs in insufficient numbers. What "prudence" and "deliberation" on the part of the bees this suggests to the ordinary observer! Again the same reflexes impel a colony to erect queen-cells if the queen is kept confined for a long time (see p. 14). It is, I believe, for the greater part an unsatisfied instinct for feeding. In the first case we have the pabulum, which is produced in great quantity, and which is not reaching its natural destiny, acting to produce a hypernutrition of the bees, and consequently the stimulation of organs which normally are not stimulated at all.

<sup>35</sup> Dathe, l. c., p. 161.

<sup>36</sup> I shall not consider further the special abnormal hive odors generated by disease (dysentery, foul brood, etc.), nor through the irritability over the lack of the queen.

THAT MYSTERIOUS TROUBLE; THE HONEY  
GATHERED DURING CERTAIN ATMOS-  
PHERIC CONDITIONS WAS  
THE CAUSE.

On page 1568, Dec. 15, I read Mr. Youngman's article on the loss of his bees. Twice during 43 years my bees gathered honey in the fore part of June that did not agree with them; and if it had not been for a sudden change for the better in the weather conditions my colonies would have gone down as Mr. Youngman's did.

In the summer of 1906, while on my rounds through the province inspecting apiaries I found many apiaries affected just like Mr. Youngman's, only not so bad. For a time sick bees could be seen on the grass in front of the colonies, crawling away to die; and when I examined the colonies I found a good many dead larvae here and there all through the brood-chamber.

Mr. Youngman asks if this trouble will return. No, not if the atmospheric conditions are right when your bees are gathering honey, and they are generally right then.

Woodburn, Ont. Wm. McEvoy.

GERMINATING BASSWOOD SEED.

I have tried to germinate basswood seed in all kinds of ways, and have never yet been able to make more than a very few grow.

Austerlitz, Mich.

H. W. HYSER.

[It is very difficult indeed to germinate basswood seed. We manage the problem, however, very satisfactorily by taking up the little plants under the basswood-trees every spring. Nature does better than we can. Evidently basswood seeds require considerable freezing and thawing before they will germinate. At all events, the young trees will spring up very numerous under a thrifty basswood providing there is not too heavy an underbrush nor too many dead leaves. If the soil is not too heavily covered with grass the young trees will come up in large numbers. These can then be transplanted.—ED.]

MEETING OF THE LEBANON COUNTY, PA.,  
ASSOCIATION.

The Lebanon County Bee-keepers' Association held a meeting Dec. 29 at the queen-rearing apiaries of S. K. Snyder, Lebanon, Pa., to elect officers for 1908, and transact other important business. A feature of the meeting was a display of wax, ranging through all shades from almost pure white to black, showing the results of careful rendering from clean combs, and carelessly

from old dirty and pollen-clogged combs. There was also a display of fancy comb honey by various members.

The Association holds quarterly meetings at the home of some member, where they display their products, have social chats, tell of their success or failure as the case may be, and try to outdo each other in the production of fancy honey and wax. Much interest is taken in those meetings, and they are looked forward to with pleasure.

The financial condition of the association is good. It has 25 members on the roll, with prospects of a good many more.

E. L. BROWN, Sec.

LIQUEFYING HONEY BY EXPOSURE TO HOT  
AIR, OR OVER A STEAM-COIL.

In your footnote to Mr. Townsend's article, page 1575, Dec. 15, you say, "The novice should clearly understand that honey should never be heated except over a body of water." Are you sure that this is strictly correct? A few years ago the question of using dry heat to liquefy granulated honey was discussed in our State convention at Madison. Mr. Geo. W. York, of Chicago, said that he placed a 60-pound can of honey on his steam-register, and it was nicely liquefied without injuring the honey. Since that time I have liquefied tons over an asbestos mat placed on the top of a stove-drum over a soft-coal stove, and always without any detrimental effect.

I have seen the plan of placing the cans over an ordinary hot-air register, in any home or building where a furnace is used, put to the test with like good results. I believe that dry heat is all right, only it is slower than the hot-water plan. But in many cases it is very handy, and the element of time may make no difference. The main point is to heat the honey to a temperature not high enough to injure the flavor. The dry heat can be gauged as readily as the other, and is a safe method if properly applied.

HARRY LATHROP.

Bridgeport, Wis., Jan. 25.

[There is not the slightest objection to liquefying honey on a coil of steam-pipes or furnace register; but many do not have these. To heat a can of honey on an ordinary stove-mat we should say would be attended with a great deal of risk, to say the least. You, as an old veteran in the business, would have no trouble, but to advise a novice to attempt that method would be unwise. We still believe that the average person should melt his honey over water unless he has steam-coils or a furnace-register at his disposal; and even then the hot water would be quicker.—ED.]

A REPORT FROM AN AUSTRALIAN BEE-KEEPER.

It may interest some of your readers to know how we are progressing in this part of the world. We are having a very dry spring. The outlook for a honey crop is not at all bright. The bees wintered well, but would not build up except by feeding. I have 130

hives of bees, half of them are strong, and the other half fair; but I have been feeding for about six weeks to keep them in good condition should the weather break. I find the articles written by E. W. Alexander, Doolittle, and Dr. Miller very interesting—in fact, some of the kinks we get from the pens of these men are worth dollars to us, which we may never find out in a lifetime by our own experience.

F. C. GOLDER.

Pittsworth, Queensland.

#### A DURABLE HIVE-STAND.

The hive-stand for me is a bench made of slabs from a saw-mill, cut long enough for two hives. Bore two holes in each end for the legs. If for a hill-side, make the front legs longer to even up the grade. I use lo-

HIVE-STAND MADE FROM A SAW-MILL SLAB.

cust or red cedar for legs, and they last a long time. Few men will ever live to use the second set. Such a stand is cheap, and handy to move, and better than cement to save the hive-bottom.

For contracting the entrance to the hive, make a letter L of two strips one inch square. One of these should be three inches long, the other two inches. By reversing we have a

small or medium entrance, said letter L to lie on the alighting-board. A corner may be sawed from a board as shown, and I like

such a block better, only it costs more if the lumber has to be bought.

Blairstown, N. J.

W. E. CONKLIN.

#### TOP AND BOTTOM STARTERS; A REASON WHY COMBS ARE SOMETIMES IRREGULAR; HOW TO CORRECT THE OCCASIONAL DEFORMITIES.

I have just read W. A. Pryal's trouble with bottom starters in sections, and Dr. Miller's ideas in regard to his failure. I have had the same deformed comb as shown in GLEANINGS, but not more than one in two or three hundred when I used full sheets of foundation.

I use the Hubbard section-press and Daisy foundation-fastener, and the tall Ideal plain section. I cut the starters as wide as they will work well between the walls of the section. My explanation of the cause of the deformity, or not connecting of top and bottom starters, is this: Occasionally a section will not stay square as it leaves the press. When the foundation starter is put in the top, the reëntering side of the section crowds the foundation to the obtuse angle, and, later, when it is placed in the super and squared up, the side of the section next to the obtuse angle strikes the foundation and presses it out of plumb at the opposite lower corner so far that the bees fail to connect it with the bottom starter, but fasten it to the fence, even when I have carefully leveled the hive-stand with a spirit-level. Sometimes the starter is broken loose from the top entirely.

For these reasons I cut sheets of foundation in two, and used only half-sheets for the top and about a  $\frac{1}{4}$ -inch piece at the bottom. This practically overcame the trouble. I have seen the two combs meet half way, but I never saw the lower one tip over to one side. The only combs fastened to the fence was where the upper starter fell down.

After following this plan for several years, getting straight combs, with only the fault that there might be creep-holes on the sides in case of a light honey-flow, I tried again with full sheets at the top of the section, and the lower starter not as wide as usual. I watched those sections that were not square, and corrected their shape till I saw them properly placed in the super. In this way I have reduced the number of deformed ones to a minimum, and believe it pays to use full sheets of foundation in sections, with a bottom starter.

LaMoille, Ill.

A. D. HOPPS.

#### INCREASING THE CAPACITY OF THE ALEXANDER FEEDER BY THE ATMOSPHERIC PRINCIPLE.

Ever since the Alexander feeder has been on the market I have been watching for somebody to say something about a Board-

man-Alexander feeder. Take a board about  $\frac{1}{2}$  in. thick and  $4\frac{1}{2}$  wide. Bore a three-inch hole through it and nail it on the top at one end of an Alexander feeder. You can use either quart or one-half-gallon Mason fruit-jars. It can be used either with or without the jar, according to the amount you want to feed. The jar should project down in the feeder about  $\frac{1}{2}$  inch or more. I make my feeders out of  $2\times 4$  material, boring them out with an expansive bit. No special cap is needed. Just punch some holes in a fruit-jar lid.

HARLEY CONDRA.

Seymour, Iowa.

[This feeder was illustrated on page 151 of our last issue.—ED.]

#### SPRINGS TO HOLD THE ENTRANCE-BLOCKS IN PLACE.

I have a very simple device to use for keeping the entrance-blocks in place. I have found the blocks so often moved, and perhaps a weak colony robbed out, that I tried the plan I now use, and find it works perfectly. I use a spring for each block, made from a piece of No. 9 steel wire, 8 in. long, with  $\frac{1}{2}$  in. at one end bent at right angles. The short end is driven into the front of the hive about  $2\frac{1}{2}$  in. from the side, and high enough so that the lower end is just above

the bottom. A small staple straddles the spring an inch from the top, leaving about 6 in. clear. The entrance-block ( $\frac{3}{4}\times 1\frac{1}{2}$  on edge) slips between the free end of the spring and the front of the hive. The springs are perpendicular when in place.

McAlpine, Ont., Can. E. H. CLARE.

#### LATE FALL FEEDING AS ADVOCATED BY E. W. ALEXANDER.

I wish to say I most heartily indorse what Mr. E. W. Alexander says in regard to late fall feeding of bees. Jan. 1, page 29. I have experimented along that line for several years, and I have found where fed heavily with sugar syrup, owing to climatic changes, or weather, or some other way, possibly the conditions of the colony, the stores fed would granulate unless there was added 5 lbs. of

honey to every 20 lbs. of sugar used. If tartaric acid was used instead, I have never lost a single colony fed this way, and packed five or six inches on sides and back end of hive, 10 to 12 inches of buckwheat chaff on the top, with the cover of the hive slightly raised at the back end of the hive, then closed after zero weather is past. My bees have been always in fine condition in the spring.

Dushor, Pa.

C. W. RUMSEY.

#### THE ACTION OF THE NEW NATIONAL PURE-FOOD LAW WITH REFERENCE TO HONEY PUT UP IN TIN.

Please tell me if extracted in tin packages is subject to the food and drug law.

North Creek, Ohio.

F. J. KRUMM.

[Honey put up in tin, especially original packages, does not necessarily require labels; but all such honey, when shipped from one State to another, must be exactly as billed; that is to say, it must conform entirely to the representations of the seller to buyer. If labels are used they must exactly represent the contents.—ED.]

#### PIE-PLATES FOR HOLDING FEED WHEN COLONIES ARE SHORT OF STORES IN COLD WEATHER.

Last fall I bought a lot of bees that had been worked for extracted honey. The one who worked them left enough honey to feed the bees until the next season. But as it was late in the season I concluded not to feed until needed, or to defer feeding until spring if possible; but early in the winter the children where the bees were located moved the lids and cloths on the hives so the stores that they had were robbed and wasted.

After saving the remnants I saw that I would have to feed. After the first attempt at making candy in greased pans I was somewhat disgusted with all the bother and fuss. Then I remembered that some one told me, or I read it or dreamed it, that the prepared hot candy could be poured into pasteboard box lids and bodies cut down to the proper depth.

As I was fussing with this plan and now then expressing my disgust, a friend who was living with me gave me an idea. The next few minutes found me riding as fast as I could to the nearest bakery; and, after arriving home, all the fuss and bother was over, as all I had to do was to pour the hot candy into the paper pie-plates that I purchased, and set them away to cool, after which they were given to the bees.

Before my friend mentioned the pie-plates the different books and papers I had read put loaf sugar in my mind; but I think my friend's plates saved me money, and the bees received the required feed with less difficulty, as I found a few with liquid feed near the cluster, and only a little granulated honey in the hive.

It seems to me as though the editor and some others did a little experimenting on this line last winter, but too late to help me; and as I never read or heard of the paper

plates I thought I would tell the whole thing, even if some things were retold.

Ft. Collins, Colo.

R. L. PENNELL

[In our issue for Jan. 15, page 96, we gave some experiments on feeding candy in winter. Perhaps it is this to which you refer.

Candy made of sugar and honey mixed into a soft dough should never be given to a colony of bees *unless* it be given in paper pie-plates, or wooden butter-dishes, or some sort of receptacle to prevent the candy, when it becomes warm or moist, from running over the frames and killing the bees.—Ed.]

#### THE LOSS DUE TO EVAPORATION IN THE FEEDING OF SUGAR SYRUP.

I see you and Mr. U. H. Bowen overlooked two very important points regarding his experiments in feeding bees, as recorded on page 1599, Dec. 15. 1. The bees had not yet completed evaporating that syrup when he did the last weighing, as will be seen by comparing weights at the different dates. From the 15th to the 17th, out of the 6 lbs. previously fed, there was a loss of 4 lbs. During the next two days the loss was but 2½ lbs., while it should have been as much as during the previous interval. Probably damper or colder weather made the difference. If he had weighed the hive each day for a week longer he would have found them losing all this time more than was necessary for their subsistence, probably causing a shrinkage of 5 lbs. more, reducing his 19 to 14 lbs.

2. When the bees had completed evaporating that syrup in cool damp weather it still contained at least 25 per cent of water, still reducing the amount to 11½ lbs., or 55 per cent of the sugar fed. When the bees had this "honey" capped, the amount was still more reduced.

I am very glad to get his report, as I had contemplated feeding syrup next fall for winter feed, because I thought it cheaper than honey. I think Mr. Alexander loses too much by extracting and feeding back; and his plan evidently unduly excites and wears out his bees, and he can sufficiently stimulate breeding in a way that will save stores and not be so hard on the bees.

Lander, Wyoming. I. W. BECKWITH.

#### HOW TO FASTEN FOUNDATION TO HORIZONTAL WIRES.

On a cool morning place your frame upside down on the table. Slip the foundation clear down into the groove, but in such a way that every second wire will be on the opposite side. It is easy when the wax is cool. Leave it that way till the day gets warm and the wax soft; then press in the wedge strips; lay the frame down; spur the wire down, first on one side and then the other.

A. BRUHN.

Enumclaw, Wash., Dec. 29.

[Your plan is perfectly feasible; in fact, we believe it is the only right way for the wedge-top frames and horizontal wires.—Ed.]

#### TUBERCULOSIS AS A DISEASE OF THE MASSES.

Oh how I do love good books! and I love the good men and women who give the world good books at reasonable prices. You know I have had considerable to say of late in regard to the "great white plague" (probably because of the dear sister who has been thus afflicted\*), and that is why I have been so eagerly watching for reports regarding the efforts of our great doctors to combat it. Well, one of my "happy surprises" was to get hold of Dr. Knopf's prize essay. It is published by Fred P. Flori, 514 East 82d St., New York, and much credit is due Mr. Flori for giving the world such a beautiful book for only 25 cts. paper, 50 cts. cloth. There are 104 pages and 30 illustrations, some of them beautiful half-tones, and I rejoice to learn that the book has *already* been translated into 21 different languages.

The motto of the book, given on the cover, is "To combat consumption, as a disease of the masses, successfully, requires the combined action of a wise government, well-trained physicians, and an intelligent people." The book should be read by everybody, and everybody will be pretty sure to read it after getting once well started. It should be read by all, because the ways of living that stamp out consumption will stamp out a hundred other ailments as well. It is along the lines T. B. Terry and myself have been urging for some time past. Plenty of air, and cool outdoor air at that, is the great theme. I told you last winter and spring, or tried to tell you, that the best place for *chickens* was not an *apartment* warmed up by steam-pipes, and I felt then and feel now that God was revealing it to me that *human beings* should not be warmed by warm apartments. If you can not do any better, perhaps it is better to be warmed thus than to suffer with the cold. If *obliged* to sleep in a warm room, fix something so you can sleep with your head out of the window or on the window-sill with the window up.

The book contains several pictures of arrangements of this kind. A large part of the book (and several illustrations) is devoted to doing away with indiscriminate spitting on the floors and sidewalks, and *pocket spittoons* for consumptive people are described and illustrated. Humidifiers for correcting too dry an atmosphere indoors are described and illustrated. Here we have "Terry" again.

The matter of diet is fully discussed by the

\*I am extremely happy to inform all inquiring friends that this sister (Mrs. C. D. Gardner, Manistee, Mich.) is *very much* better, and she has just written me that she doesn't seem to mind the winter weather at all, so far, and that she weighs more than for a number of years.

most able physicians of the world, and the whole book, in fact, as I understand it, is the result of a *congress* of the best medical talent of the world. I am sure great good would come from using this book as a textbook in schools; and if the world were compelled to read it and *live by it* I think it would do more to lessen sickness, pain, and death, than any one thing that has ever been done since the world began. It is a significant fact, and one that points plainly to the trend of the times, that *no medicine* is recommended at all. A tremendous protest is made against liquor, tobacco, and stimulants of every kind.

Reader, if you are a friend of humanity help Fred Flori to put this book in the hands of a suffering world, and *do it quick*.

I submit, in closing, some clippings from different pages:

There is no doubt that alcoholism must be considered the greatest enemy of the welfare of a nation, the most frequent destroyer of family happiness, the ruination of mind, body, and soul, and certainly the most active coöperator of the deadly tubercle bacillus or germ of tuberculosis (consumption).

In families in which there is a fear of hereditary transmission of the desire for strong drink, even the mildest alcoholic drinks should be absolutely avoided. It would also be best if all people so predisposed, or who may have acquired only the occasional desire for drink, would never smoke, for experience has taught that attacks of dipsomania (periodical sprees) are often caused by an excessive use of tobacco.

The love of nature and life in the open air should be more cultivated. In the proportion in which this is done, tuberculosis will decrease.

At the International Tuberculosis Congress which convened in Paris in 1905, the American medical profession was represented by an official delegation appointed by the President of the United States, composed of Drs. Beyer, Flick, Jacobs, and Kropf. There were also delegates from the various medical centers, among whom were such men as Brannan, of New York; Lowman, of Cleveland; McCarthy, of Philadelphia; Pottinger, of Los Angeles, etc.

At the closing session of this congress an invitation was given to have the next Tuberculosis Congress meet in Washington in the fall of 1908. That will be the first time that this distinguished body will honor our country by its presence; and the American medical profession as well as the public at large should rejoice in the distinction and the prospect of having the greatest minds engaged in the combat against the white plague gathered at our national capital.

The first executive order with a view to preventing the spread of tuberculosis among the employees of the government by a president of the United States was issued by Theodore Roosevelt, Feb. 28, 1906.

A sanatorium should not only be a place where a patient becomes cured, but also a place where he should learn some lessons for the future. All that he will have learned from the rules and regulations, and the advice of the physician concerning how to protect himself and others from contracting the disease, how not to take cold, and how not to lose what he has gained, are precious lessons which he will take home with him.

#### MY 1908 CHICKEN STORY.

Now, dear friends, even if this is to be a "chicken story," and perhaps a good deal of it specially for the children who read GLEANINGS, I think it may pay you all to read it, for in it I shall tell you a good deal about Florida, touching on it as a place for invalids, tuberculosis, lettuce-growing, and perhaps automobiles, and, may be, *flying-machines* also.

On page 63, Feb. 15, 1907, I told you about a White Leghorn hen that would not only

lay eggs and hatch chickens the year round, winter and summer, but that it was her regular habit to commence laying again when the chicks were only two or three weeks old; and by the time she had a nest full she weaned her chicks and commenced to set again. If I didn't tell you this last part, it is because I neglected to do so. I tried to buy this remarkable hen, but she was not for sale; but I told you how I did succeed in buying five of her pullets, because they *persisted* in flying over the fence and getting out of the yard. I told you last winter of my plan to develop this valuable trait in watching the five pullets and their progeny. With the cheap incubator and sitting hens, I secured something like 100 chickens; but a large part were roosters, and many of the pullets were more or less colored; and as I wanted my new strain to be all white I asked Mr. Shumard to send me only the white pullets. He therefore shipped me 26 pullets and 2 roosters. On p. 44, Jan. 1 this year, you will see a report of *one* of these five white hens. Sure enough, she began to cluck almost as soon as she was let out with the other 25; but she kept on clucking (probably because she was separated from her 20 chicks before it was time to wean them), even while she laid an egg every day. Now please turn to p. 498, April 1, 1907, and read the article about "fighting mothers." I soon found, by her leg band, this hen that clucked every day while she laid was the fighting mother of last winter, and I soon found, also, that she was the acknowledged boss of the ranch. Young or old roosters included, cleared the way when she came along. This winter I have a 66-egg Cyphers incubator, besides the old cheap one; and as our people in Ohio had shipped me a new brooder they wanted me to try in Florida, I made no provision for my chicks.

When the chicks began to hatch, the brooder hadn't reached here, and I had been unable to coax a single one of my 26 hens to get broody. The day *after* the chicks were out, this "fighting mother" I have been writing about was on her nest when I went to gather the eggs. She not only "flatly refused" to vacate, but came so near taking several "mouthfuls" out of the back of my hand that I thought I should have to back out. She stayed on the nest over night—just *one* night, mind you. When I spoke of giving her some of the chickens from the incubators Mrs. Root (and the neighbors whom we consulted) said she would kill them, *sure*. I suppose you all know there has been a lot said and written about introducing queens. Well, I think I can tell you something about introducing "day-old chicks." I took one chick first, the one that first broke the shell. I tossed him up against the hen; but as she paid no attention to him he soon traveled back out of the barrel where she was sitting. Just about sundown I tried again. I took a dozen chicks and tossed them one after another over behind her; but she apparently paid no attention to the poor motherless waifs. Mrs. Root said, "There! didn't I tell

you that no hen would take chickens when she has been sitting only one night?"

Right here something happened. Let me digress a little. In some one of the States a law was passed requiring that not only should automobiles stop when horses seem fractious, but that the driver should say "soothing words" to the frightened animal. One of the automobile journals had a good deal of merriment about the "soothing words," and suggested the law-givers should furnish some samples of the words to be used. Well, that Leghorn hen, after considering the matter a little time (as any *good* and *wise* mother should), evidently decided in her wise little head to adopt the newcomers, even if the whole thing was rather premature. She uttered a few "soothing words" to those poor "orphlings" that had never seen a hen before nor heard a cluck. The effect was electrical. They responded in a shout of joy. Of course, it was a very small shout; but the language on both sides was the method of communication that came straight from the great God above. There were 73 in the two incubators, and we gave her about half, that night, and the rest the next day. It is now the wonder of the neighborhood to see her march about with her flock. The second night it was so cold there was ice on the boards; but she cared for them all without a loss. They huddle under and over her, and around her, and keep the whole inside of the barrel at nearly brooder temperature. Mr. Rood looked into the barrel one evening and declared we must have a "flashlight" photograph of the happy family. As nearly as I can make out, they keep slowly changing places during a cold night, much as the bees in a cluster change places. Those that get too warm come out in front and let the chilly ones go back.

Owing to the unusually fine weather and abundant rains, lettuce has been rather a drug in the northern markets, and Mr. Rood has almost a quarter of an acre of the finest "Big Boston" head lettuce I ever saw, with no market for it. As fast as the heads threaten to burst I am taking them, by the wheelbarrowful and giving them to my 25 laying hens. Yesterday I got 19 eggs and 20 to-day. A barrowful lasts them hardly two days; and not only is their ration of grain greatly decreased, but as long as they have plenty of lettuce all other garden stuff is unmolested. You can throw open the gate to the poultry-yard and let them have free range, thus saving expensive fences of netting if you give them plenty of grain and water, and all the lettuce they want. With eggs at 35 cts. per dozen I am inclined to think it will pay to grow lettuce for poultry. My flock of 70, a week old, will consume two good-sized heads a day. I slash it with a sharp caseknife across two ways and then across the top, so as to shred it small enough for them to swallow, and they seem to thrive on it with all the "baby-chick food" they will take.

**OUTDOOR AIR FOR CHICKENS AND PEOPLE.**  
 ¶ Before I knew I had a sitting hen I prepared a home-made brooder by covering a square five-gallon can with old clothing and

filling it with hot water. It was placed on its side a few inches over the floor, and curtains put around it in my incubator cellar. The cellar keeps pretty near 70 degrees day and night, with a pretty good supply of fresh air, and the chicks did very well until I gave them to the hen. Mrs. Root protested, however. She said they wanted the outdoor sunshine, and, above all, they needed a *mother*. She doesn't believe very much in lamp-heated brooders. Now listen a minute. Cyphers "Hints" says the temperature of the brooder should be about 95 the first week; 90 by the end, and 85 the second week, and so on. The chicks in that barrel were running all over the dooryard when the temperature was below 50, and they were less than a week old. Some of them would scud out when it was only 40 early mornings, and then back under the hen, or into the "cluster" in front of her, until they warmed up for another trip. I wish you could all see my outdoor chicks, and then take a look at those in the best artificially warmed poultry establishments. You may recall that I visited several of them around New York city last April. If a sitting hen can "handle" 70 chicks in Florida in *January*, what does anybody want of a brooder? Another thing: The "books" tell us gravely, "Chicks should be kept in the brooder 6 or 8 weeks," according to the weather.

Now, dear reader, we come to something of more importance than the chicken business of the whole world, even if it is the most important rural occupation. Thousands of human beings are kept in palatial "brooders," warmed by artificial heat, and breathing bad air, when there isn't a shadow of an excuse for it. Elsewhere I have made editorial notice of a wonderful book on tuberculosis by Dr. S. A. Knopf. Some of the beautiful pictures of the way they cure consumptives (outdoors in the pine woods) brought vividly to mind the picture of those 70 chicks around the mouth of their barrel. The multitude of bright little eyes, and the happy contented "cheep, cheep" (even with a temperature of 40 outside), are never found in brooders warmed with a lamp at a temperature of 85 to 95—that is, unless I am very much mistaken.

While I was watching and enjoying my busy mother with her flock of 70, Mrs. Root said, "There is a fine automobile coming up the road; don't you want to stop and see it?" Please bear in mind it was not so *very* long ago that automobiles were my latest hobby. I considered a minute, and then replied, "Sue, to tell the truth, *just now* I would not trade my 'fighting mother' hen, with her brood of 70, for their whole outfit—that is, for my own personal use."

In conclusion, if other hens can not be made to do what this hen does, then we should "get busy" and develop a strain of fowls that will lay and sit, and take charge of large broods from the incubator, and work cheaper and *do better work* than any artificial mother ever did, or ever can do. Veritable "Florida flying-machines" they will be.

## "Put Yourself in His Place"

**PUT** yourself in the place of the man behind the desk—the man who directs the work of others—the man who is a power in a big city.

*You can do it—*

*You can be as big a man as he—*

*You can make as much money as he—*

*You can enjoy the same advantages as he—*

*If you get the knowledge that has put him in his place.*

We will send you that knowledge in compact, easily accessible form—easy to read, and with everything fully explained in a plain, simple and easy way.

**You can get all this in the CYCLOPEDIA of ENGINEERING—**

*On free trial, express prepaid, for 5 days' examination at your leisure in your own home.*

*There is nothing for you to pay in advance.*

*If you do not find these books all we claim them to be, simply return them at our expense and you have not paid us a cent, and do not owe us a cent.*

*If you want to keep them—the price, for a limited time only, is \$14.80, instead of \$36.00, less than half the regular price—and you can pay the \$14.80 on small, easy, monthly payments.*

*After you have studied these books in your own home in your spare time, you will have the best foundation for becoming a big man in a big city.*

The Cyclopedia of Engineering gives you all the knowledge that working engineers have gained by years of hard work and close study.

The Cyclopedia of Engineering is the most practical—the most complete—the most easily understood work ever published on Engines—Steam, Gas and Oil, Marine Engineering—Electricity—Automobiles—Steam Engines—Boilers—Pumps—Refrigeration Heating by Furnace—Steam and Hot Water, and a full list of other engineering subjects.

The greatest authorities, the most practical experts, the best known engineers have helped to make this great work the best in the world for home study.

The "Cyclopedia of Engineering" is made up from the regular courses of the American School of Correspondence, and arranged especially for a practical reference library.

It was written by expert teachers and working engineers who have had years of experience in the lines.

Among these men are Louis

Derr, A. M., S. B., Associate

Professor, Mass. Institute of

Technology; F. B. Crocker,

E. M., Ph. D., Head of De-

partment of Electrical Engineering, Columbia University; L. S. Marks, S. B., M. M. E., Assistant Professor of Mechanical Engineering, Harvard University; C. L. Griffin, S. B., Mechanical Engineer, Smet-Solvay Co.; W. B. Snow, S. B., Mechanical Engineer, B. F. Sturtevant Co.; L. V. Ludy, M. E., Professor of Mechanical Engineering, Purdue University; C. L. Hubbard, S. B., M. E., Consulting Engineer on Heating, Ventilating, and Lighting; G. L. Fowler, A. B., M. E., Consulting Engineer; L. K. Sager, S. B., Patent Attorney and Electrical Expert; F. W. Turner, Instructor in Machine Shop Work, Mechanic Arts High School, Boston.

The six massive volumes (page size 7x10 in.) are bound in half red morocco, 3,000 pages, over 2,000 diagrams, sections, tables, formulae, etc. Complete sets of test questions in every volume, thus combining the best features of a text book and reference work.

It will only cost you a postage stamp to send us the free coupon.

Sign and send it to us now and save \$21.20.

We have only a limited number of these books that we can sell at this very low price—so let us hear from you at once before they are all gone.

Address O. C. MILLER, State Secretary,  
Dept. 154, Administration Building,

## Let this Free Book tell you how to double your Potato Money

You can learn of the one way to plant your potatoes cheapest, how to save seed and soil, how to double the profit of every acre of your potato land.

You can get this book free for your name on a postal card. It will tell you all about the proper care of potato fields, proper methods of planting and cultivation, how to save hundreds of dollars in fertilizer money alone.

It will tell you how to do all this at a cost of but one dollar. It will describe the one planter that makes this all possible—the famous Acme Hand Planter. It will place in your hands all the great, vital truths of Potato Culture, condensed and plainly written, so it is easy to read and remember them.

You will want this book to put its precepts into practice on your own farm. Send for it now. Just say on a postal, "Send me your potato book."

**POTATO IMPLEMENT COMPANY,**  
Box 520, Traverse City, Mich.

### THE "BEST" LIGHT

One burner will give as much light as ten ordinary oil lamps; six 16 candle power electric bulbs—six 16 candle power gas jets or five acetylene gas jets. Costs 2 cts. per week. Produces a pure, white, steady, safe light. Over 200 styles. Every lamp warranted. Agents wanted. Write for catalog.

**THE BEST LIGHT CO.**  
306 E. 5th St., Canton, O.

## EXCELL IRON ROOFING and STEEL Siding

Direct To You from our own factory at lowest factory prices. We are manufacturers and handle no 2nd hand nor short length stuff. Every part of our roofing and siding is made in our factory from genuine Charcoal Iron, Double Keened Puddled Iron or Steel. Put on the kind of roof that wears. Ours is guaranteed. It isn't the best you can buy anywhere, don't pay for it. Easy to lay. No experience needed. Tell us about your building and let us quote you factory prices. Write for Metal Goods Catalog. It is free.

**THE UNITED FACTORIES CO.**  
Dept. No. R37, Cleveland, Ohio.

## MY VEHICLES ARE YOURS TO TRY 30 DAYS FREE

This is the plan that I adopted seven years ago, and it has been satisfactory to both my customers and myself. In addition to that, I guarantee to save you  $\frac{1}{3}$  in the cost. I sell my SPLIT HICKORY VEHICLES direct from my factory to the user. There is no middle-man's profit between us—no agent between you and me. My goods are backed up by my two big carriage factories—Cincinnati and Columbus bus.

One hundred thousand Split Hickory Vehicles in use all over the United States. Thousands of customers everywhere who say they saved money in dealing with me. Write for my FREE 192-page Catalogue today. A postal will get it. Runabouts, Driving Wagons, Top Buggies, Automobile Seat Driving Wagons and Two-in-One Top Buggies, Carriages, Surreys, Spring Wagons and Harness, all at prices guaranteed to save you from 33% to 50%.

Address me personally—write today. Catalogue will come, postage paid, by return mail.  
Address—H. C. PHELPS, Pres.

Station 293  
Col. mbus, Ohio  
Be sure and address all mail to headquarters—Columbus, O.

## Make your garden pay double

**Planet Jr. Farm and Garden Tools** save time and labor, take the place of expensive "help", and prepare for a bigger, better crop. They do great work and they last long—made of the finest materials for the purpose, and guaranteed. They pay for themselves over and over again.

**No. 25 Hill and Drill-Seeder, Double-Wheel Hoe, Cultivator and Plow** combines every useful tool in one strong, light, easy-running, simply-adjusted implement—opens the furrow, sows the seed in drills or in hills 4 to 24 in. apart, covers, rolls, and marks out the next row; and does thorough work as a double-wheel hoe, cultivator and plow.

**Planet Jr. 12-tooth Harrow, Cultivator and Pulverizer** is a great tool for berry growers and market gardeners—invaluable wherever fine close work is needed. The twelve chisel-shaped teeth leave the ground in the finest condition. Turns hard work for three men into easy and better work for one. Write today for illustrated 1908 catalogue describing our 45 kinds of farm implements including Wheel-Hoes, One-and Two-Horse Cultivators, Harrows, and Orchard and Beet-Cultivators. **S. L. Allen & Co. Box 1106E, Philadelphia, Pa.**

# Quality of 35 Years Breeding

A WELL bred horse is always a beautiful sight. Admiration grows as we note one point after another. But then this wonderful horse did not just happen to be so beautiful and useful.

It's the result of years of careful breeding.

And so it is with everything that has merit.

Theoretically—on paper—it always seems so easy to reach perfection with a few years experience. But it always lengthens from 10 to 20, 30 to 40 years before perfection is attained.

And that's just the reason that Lowe Brothers "High Standard" Liquid Paint has reached the point of leadership.

It has taken 35 years of careful painstaking effort to make it the best paint produced at the cost of time and money.

Extreme care has been taken to get only the best ingredients that could be obtained.

It is a well bred paint. Bred to a degree of sound idealism.

**THE LOWE BROTHERS COMPANY, 450-456 Third St., Dayton, O.**  
Paintmakers Varnishmakers

NEW YORK CHICAGO KANSAS CITY

It's a merit-paint.  
And the "Little Blue Flag" is the mark that signifies merit in paint and varnish.  
Thirty-five years of experience—conscientious effort and honesty of purpose is back of that FLAG.

It is YOUR guarantee of good paint and varnish—the best obtainable at any price.

Eliminate all chance of getting poor paint by asking for and insisting upon Lowe Brothers "High Standard" Paint.

Valuable information about paint is contained in our booklet, "Attractive Homes and How to Make Them." It's free. Send for a copy.

"The Little Blue Flag"  
—Your Protection

Simple, perfect, self-regulating. Hatch every fertile egg. Lowest priced first-class hatcheries made. **GEO. H. STAHL, Quincy, Ill.**

# PORTER BEE-ESCAPES

## HIVE ESCAPE

When taking off surplus this is the greatest saving device. It does away with the shaking of the heavy supers, the cruelty of excessive smoking which causes the bees to uncap their honey and start robbing. Just tip the super to the angle of 45 degrees and insert the board. In a few hours it is free of bees; then take off your super. You can as well afford to be without a smoker as without the Porter Bee-escape.

### PRICES

Each, 20 cts.; dozen, \$2.25; postpaid. With board, 35 cts. each; \$3.25 per 10; by express or freight.

### TESTIMONIALS

They are perfect in action.—British Bee Journal.

No bee-keeper can afford to be without them.—Prof. Cook in American Bee Journal.

Worthy of highest commendation.—Eugene Secor, judge on awards, World's Fair, Chicago.

I would not do without them even if they cost five dollars apiece.—W. Muth-Rasmussen, Independence, Cal.

They are absolutely perfect. I can not tolerate my own make since using them.—John S. Reese, Winchester, Ky.

They are one of the best things ever brought into any apiary, and should be used in every bee-yard in the whole world.—Wm. McEvoy, Foul-brood Inspector, Ontario, Canada.

There is no robbing or fighting or disturbance in the apiary when the surplus honey is taken off with them. They are simply perfect.—W. Woodley in British Bee Journal.

## HOUSE ESCAPE

To be used over the doors and windows in the extracting-house, or any place you wish to clear of bees. The most persistent robber can not return. Some bee-keepers make a practice of taking off the filled supers and stacking seven or eight in a pile. The Porter Honey-house mounted on a board makes the best kind of escape. Don't wait till to-morrow before you get a supply. You can not afford to be without them longer.

### PRICES

Each, 25c; dozen, \$2.75; postpaid.

### TESTIMONIALS

The Porter bee-escape clears the supers of bees so perfectly and quickly and easily that it makes the taking off of honey a pleasure instead of a dread as in former years.—G. M. Doolittle, Borodino, N. Y.

The removal of full honey-boxes has become an amusement since we began using the Porter bee-escape.—Ed. Bertrand, Editor Revue Internationale d'Apiculture, Nyon, Switzerland.

This number of the Review contains more unqualified praise of the Porter bee-escape than any other issue has ever contained of any other implement; but so long as it is deserved, who cares?—Bee-keepers' Review.

They are the greatest thing on earth for expelling bees from supers.—G. J. Flansburg, South Bethlehem, N. Y.

I would not be without them for four times what they cost.—Dr. W. A. Tufts, Musson, La.

Undoubtedly the best bee-escape is the one invented by R. & E. C. Porter.—W. S. Pouder, Indianapolis, Ind.

Bee-men are certainly behind the times if they can afford to use them and do not.—M. H. Mendleson, Ventura, Cal.

## THE A. I. ROOT CO.

MEDINA :: :: OHIO

Only two years have elapsed since we brought out an edition of 15,000 copies of the well-known A B C of Bee Culture. This brought up the number to 100,000 copies, thereby surpassing in popularity all other bee-books ever printed.

The demand for these has been so great that we were compelled to undertake a new edition at once, and in doing so we took the opportunity to revise and greatly enlarge it again, though it had been generally considered quite a large book.

In doing so we brought in new blood to assist us, give new ideas, and otherwise enable us to produce as good a book as it is possible to make at a popular price. If you will carefully examine a copy you will be prepared to admit the new volume is quite an improvement on its predecessors. To keep pace with improvements it contains nearly 100 double-column pages more than the previous edition.

The new methods of queen-rearing have been carefully reviewed, and the main points incorporated in the new edition, so that the practical bee-keeper who possesses a copy will have the best ideas of the subject constantly by his side for reference.

The new methods of wax-production are treated in an exhaustive fashion; and as this subject is now of more importance than formerly, more space has been devoted to it.

The new power-driven automatic extractors are amply illustrated and described. The subject of diseases has received entirely new treatment to keep pace with the new discoveries of the last few years. The laws relating to bees have for the first time received full treatment. No other bee-book treats of this very important subject. Honey, sugar, nectar, and glucose are carefully defined in accordance with the demands of our new pure-food laws.

In accordance with the ideas of its first author, A. I. Root, the new A B C and X Y Z is *eminently practical*.

German edition (new), paper covers, \$2.00; cloth-bound, \$2.50. Postpaid anywhere. This is the famous A B C in the language of the Fatherland, to suit our many German friends.

French edition (new), cloth-bound, \$2.00, postpaid. This is another edition, translated into the beautiful language of France.

## Classified Advertisements.

Notices will be inserted in these classified columns at 30 cents per line. Advertisements intended for this department should not exceed five lines, and you must say you want your advertisement in the classified columns or we will not be responsible for errors.

## Wanted, Situations.

**WANTED.**—Position by young man to assist in apiary; would prefer the West. B. W. WELTMES, West Salem, O.

**WANTED.**—Position in apiary; 15 years' experience; up to date, and understands queen-rearing; would like position to work into partnership. State wages, etc. **BEEKEEPER**, care of Osborne, 1156 Clement St., San Francisco, Cal.

**DO YOU  
WANT A  
LARGER  
INCOME**

Investigate our adjustable concrete-molds. These are suitable for a large variety of work, such as burial-vaults, watering-troughs, and many other things needed in town and country.

INDIANAPOLIS CONCRETE BURIAL VAULT CO., 442 Board of Trade Bldg., Indianapolis, Ind.

**CUTS** USED IN THIS MAGAZINE  
ARE FROM  
**THE MUGLER ENGRAVING CO.**  
MUGLER BLDG. CLEVELAND, OHIO.

We have just received notice of the death of Mr. Henry Alley, the veteran queen-breeder of Wenham, Mass. Our sincere condolence is extended to his sorrowing family.

#### GREEN'S SEEDS.

This is the title of a new catalog which we have just printed for E. C. Green & Son, of Medina O., who succeeded to the garden-seed department of The A. I. Root Co. several years ago. They would be pleased to mail this catalog to any reader of this journal who will send a request for it. These enterprising seedsmen have originated a new tomato of such value that one of the big seed-houses of Philadelphia sent their tomato expert to Medina to examine it, and was so well pleased that he paid a big price for all the seed they had to spare. If in need of garden seeds, send to E. C. Green & Son, and as a favor to us, mention that you saw it in this journal.

#### CLOVER SEEDS.

There has been a sharp advance in clover seed, so that the best price at which we can offer Medium Mammoth or alsike seed, choice, is \$12.00 per bushel; half bushel, \$6.25; peck, \$3.25; per lb., 25 cts.; by mail, 32 cts. per lb. Alfalfa seed will have to go at the same price. Medium grades of seed may be furnished a little cheaper. Write for sample and price if interested. Strange as it may seem, white-clover seed is now cheaper than other kinds, and can still be furnished at \$10.00 per bushel; \$5.25 per half bushel; \$2.75 per peck; 20 cts. per lb. Crimson or scarlet clover will be furnished at \$8.75 per bag of two bushels; \$4.50 per bushel; half bushel, \$2.40; peck, \$1.25; 1 lb., 10 cts.; by mail, 20 cts. Unhulled white-sweet-clover seed at \$11.00 per 100 lbs.; \$3.00 for 25 lbs.; \$1.30 for 10 lbs.; 15 cts. per lb.; by mail, 25 cts. Hulled seed, when we have it, 7 cts. per lb. extra.

#### THE ALEXANDER BEE-VEIL.

We have secured, for making a bee-veil of wire

cloth, a special weave of cloth having 8 meshes to the inch, and No. 32 wire painted black. Ordinary window-screen cloth is of the same size of wire, and 12 to 14 meshes to the inch. This special cloth is, therefore, more transparent, and obstructs the vision less, than any other cloth we were ever able to secure. One objection to a veil of this kind is its bulk and the difficulty of transporting it, either by mail or when packed with other goods. We have overcome this one objection by making it with an open seam from the crown to the bottom of the skirt. Eight small safety-pins are included to pin up this seam when you receive it, or you may prefer to sew it up. The veil is rolled up so as to be placed in a box 3 x 3 x 12 inches so that it can be mailed safely for 12 cents postage, or packed with other goods to go by freight. Price, complete, 60 cts. By mail, 72 cts. Special wire cloth for veil furnished at 6 cts. per foot or piece for a veil at 15 cts.; by mail, 2 cts. a foot extra, or 20 cts. postpaid for a veil-piece 10 x 33 inches, having edges folded ready to sew on the cloth parts.

#### COLD-FRAME OR HOT-BED SASH.

We are receiving some nice orders for these sash, and we believe that, if more of the truck-gardeners understood how good they are, and the low price at which they may be had, we should be swamped with orders. We have not seen as low prices quoted by anybody else, not even the cut-rate mail-order houses, as we are making on these. Some of our readers may

know of greenhouse-men in their neighborhood who do not take this journal, and may do them a favor by calling their attention to our prices. Cypress hot-bed sash, 3½ feet by 6 feet, for four rows of eight-inch glass, with hard-wood round rod crosswise through the bars midway between the ends to help space the bars and hold them secure, shipped K. D., 90 cts. each; 5 for \$4.25; 10 for \$8.00. Put together, 10 cts. each more, not painted. If painted, add 10 cts. for each coat of paint. If glazed with 8 x 10 glass, add \$1.00 per sash; 8 x 10 glass, \$2.40 per box; 5 boxes at \$2.30, or 10 boxes at \$2.20.

#### SECOND-HAND FOUNDATION-MILLS.

We have to offer the following second-hand foundation-mills in good condition. We shall be pleased to hear from any one interested. To such we can send a small sample of comb foundation representing the kind of work produced by the particular machine you enquire about.

No. 079.—6x2¼-inch hex. cell thin-super mill, in very good condition. Price \$12.00.

No. 008.—6x2¼-inch hex. cell thin-super mill, in good condition. Price \$12.00.

No. 086.—6x2¼-inch hex. cell extra-thin-super mill, in good condition. Price \$12.00.

No. 088.—12x2¼-inch round-cell heavy-brood mill, in fair condition. Price \$12.00.

No. 077.—10x2 inch-medium brood round cell, old-style frame, in good condition. Price \$14.00.

No. 092.—6x2¼-inch hex. cell extra-thin-super mill, in fine condition. Price \$15.00.

No. 2275.—6x2¼-inch hex. cell extra-thin-super mill, in good condition. Price \$13.00.

#### NEW TAPER-PANEL HONEY-JARS.

We show here an illustration of a new style of honey-jar holding half a pound. It is a taper-panel jar with lacquered tin cap lined with waxed paper wad which turns on tight with a one-fourth turn, warranted to hold airtight. We expect to have ready soon the one-pound size of the same style jar. Packed in reshipping-cases of two dozen each, ready to ship again, when filled, without additional packing.

Price ½-lb. taper-panel jar, 80 cts. per case; 6 cases, \$4.50.

Price 1-lb. taper-panel jar, \$1.00 per case; 6 cases, \$5.70.

Put up in crates of 2 gross, ½-lb. size, \$3.75 per gross. Put up in crates of 1 gross, 1-lb. size \$4.80 per gross.

#### SIMPLEX HONEY-JARS.

The factory have assured us that we may again secure this popular honey-jar in several sizes, including the one holding one pound of honey. We have ordered a fresh supply, but do not expect to have them in stock till next month. They will be packed in reshipping-cases of two dozen each, and the price will be \$1.10 per case; 6 cases, \$6.30.

#### NO. 25 HONEY-JARS.

During the past year we have had an unusual amount of trouble with breakage of this jar, even in the reshipping-cases packed with corrugated paper. The breakage occurred either in the porcelain cap or the top rim of the jar where the cap rests. We find we can get this same jar with lacquered tin cap without the center being cut out. This cap is lined with waxed paper wad, which seals tight on the top edge of the jar. This style of cap not only does away with breakage almost entirely, but enables us to furnish the jar at a lower price. We are not yet supplied with the new stock, but expect to have them next month at the following price. They will be packed as usual, two dozen in reshipping partitioned cases. No. 25 jars, tin cap lined, 90 cts. per case; 6 cases, \$5.10. We can still furnish from stock the usual style of No. 25 with porcelain caps at \$1.10 per case; 6 cases, \$6.30.

#### A NEW SIZE OF SECTION.

There seems to be a demand in some localities, where bees are inclined to daub with propolis or oth-

erwise discolor the wood in sections for a wide frame completely enclosing the sections. Our regular supers are adapted to the regular sections in section-holders without a top-bar. To provide a top-bar as well as a bottom it is necessary either to make the super deeper or the section shorter. In order to use the regular deep super we have decided to make a new section, 4¼x4¼x1½ or 1½ plain, no beeway. This will be used in a section frame hanging by top-bar in the regular deep super, interchangeable with the shallow Hoffman frame 5½ deep. This will necessitate a new fence adapted to this size of section, which will be designated by the letter N. The 4¼x4¼x1½ will hold a full pound, and will work best in the eight-frame super, 24 to the super. In the Danz, width (16¼) ten-frame super the 4¼x4¼x1½ will fit best 32 to the super. These sections may be split for inserting foundation by the Hand method, and the correct size of sheet for that purpose would be 4¾x17½. Price of N section-frames, \$2.50 per 100 in flat. Price of N fences, \$2.00 per 100. Sections 4¼x4¼x1½ or 1½, same price as regular Danz., \$4.75 per 1000. No. 1; \$4.25 for No. 2. Unless you specify we will send frames and sections 1½ wide, and supers fitted with the same. Deep super fitted with N section-frames, N fences and springs, either 8 or 10 frame, will be designated 2 N 8. Price, nailed and painted, 70 cts. each; in flat, 55 cts.; 5 for \$2.50.

2 N 10. Price, nailed and painted, 75 cts. each; in flat, 60 cts.; 5 for \$2.75.

With sections and foundation-starters included.

4 N 8. Price, each, nailed and painted, \$1.00; in flat, 75 cts. each; 5 for \$3.50.

4 N 10. Price, each, nailed and painted, \$1.05; in flat, 80 cts. each; 5 for \$3.75.

With sections and full sheets of foundation.

1 N 8. Price, each, nailed and painted, \$1.40; in flat, \$1.00 each; 5 for \$4.50.

1 N 10. Price, each, nailed and painted, \$1.45; in flat, \$1.05 each; 5 for \$4.75.

These are not listed in our catalog this season, and not in stock with any of our dealers. If you wish to test them you will have to make special orders to secure them. You can get them through your dealer if you order in ample time and are not in a hurry to receive them. This section will require a new size of carton and a new size of shipping-case to put them up for market. We offer the new size for experiment this season to see if it has sufficient warrant for introduction into the catalog another year. By cutting beeways in the top and bottom they could be stored without fences or separators, and four could be placed in a shallow Hoffman frame for storing, though they would not be as well protected as in a section-frame. The latest style of shallow frame with 3-inch ends would be rather scant in length inside to take four sections, but those made earlier would have room.

#### Convention Notices.

The Northern California Bee-keepers' Association, F. J. Lewis, Pres., will hold its fourth semi-annual convention at Pioneer Hall, Seventh St., between J and K, Sacramento, Feb. 19 and 20. Morning session at ten; afternoon, 1; evening, 8. The objects of this association are to promote and protect the interests of its members. Headquarters at the Western Hotel. All bee-keepers are requested to attend.

B. B. HOGABOOM, Secretary-Manager.

#### SHORT COURSE IN BEE-KEEPING.

The University of Tennessee will give a short lecture course in bee-keeping extending from February 27 to March 11, inclusive. The tuition is free. The whole State of Tennessee is suited to bee-keeping, and this short course ought, and deserves to be well patronized. There are other short courses on different subjects which are well worth while attending by young men and women of the State.

# Mr. Bee-keeper, ☐

Was 1907 a POOR YEAR for you?

It was a GOOD YEAR for users of

## DADANT'S FOUNDATION.

One dealer used 14,000 pounds.

Another dealer used 7,250 pounds. Another dealer used 4,500 pounds. Another dealer used 4,500 pounds. Another dealer used 3,000 pounds.

*Thousands of pounds sold to the bee-keeper direct, or worked up for him out of his beeswax.*

The DEALER likes DADANT'S FOUNDATION because the bee-keeper likes it.

The bee-keeper likes it because his BEES like it.

The BEES like it because it is exactly like their own comb, so PURE and SWEET and CLEAN.

DADANT'S FOUNDATION is the Standard because it is the BEST.

Wax worked into foundation.

JAMESTOWN, N. Y.

# "If You Want a Good Recommend

for Your Buggy,  
Ask My Wife  
for It."

That's the way one of our customers wrote us recently. He also said,

"I want to tell you how well pleased I am with my Sheltertop Cab. It is far better than you represented it to be. I would not sell it for twice what it cost me if I could not replace it. It is the only buggy I ever had that I could take my wife riding in on a windy day, and enjoy myself. PERCY STITES, Wauseon, O."

**The Sheltertop Buggy** can be changed from the wide open form shown above to the tightly closed form shown below, in four seconds, without leaving the seat, dropping the lines, or stopping the horse. When closed it is absolutely storm-proof; wind, rain, mud, dust, snow, or sleet can not enter at any point; but your view in any direction remains unobstructed. There are no swinging or sliding doors on the Sheltertop Cab—no storm-apron, side curtains, no detachable parts of any kind; nothing to be lost, loaned, stolen, or forgotten.

**The Sheltertop Buggy** is built of the best material money can buy—built to wear well on rough roads—built to run light and run right through mud and sand and over rocks and ruts. It is not the cheapest buggy on the market so far as first cost is concerned, but it is the cheapest buggy in the world "in the long run."

## WHAT THE USERS SAY ABOUT IT:

I have used my buggy in all kinds of weather, over all grades of roads, and am well satisfied with it as a storm-proof buggy and with the material and workmanship. I like it because it protects me from winter weather and mud; because it is easy to get into and out of; because it is roomy, comfortable, and safe; and because it is a high-class buggy in every way.

The Sheltertop buggy came all right, and is properly named, as I consider it the best storm carriage I ever saw. It is light, and the only true storm carriage made anywhere.

F. H. CAMPBELL, Philadelphia.

The Sheltertop buggy reached me in perfect condition. For stormy or good weather I think it unequaled. It is a fine-running buggy, not heavy, and is much admired by all who see it.

LOUIS F. GRANDY, Chili Center, N. Y.

We will ship the Sheltertop buggy to any point in the United States on 30 days' "suspicion."

**Write for our free catalog.** It explains all about the Sheltertop buggy; illustrates and describes in detail fifteen different styles; tells you all about the material and workmanship, trimming, painting, etc. Write for it to-day.

TERRE HAUTE, IND.

# DEEN LOOM

**W**HY not put your spare moments to work bringing in extra cash? Some people in your town are waiting for some one to make up their rags into carpets, rugs and portieres.

It's genteel, honest work that any man or woman can do and make good profit at it. Just to prove it, here are the names and addresses of fifteen out of hundreds of people who have woven carpets and rugs at a good profit. They use a Deen Loom.

## Good Profits Made At Home

Mrs. C. R. Stover, Bradford, Ohio  
Oma Cooper, Dale, Indiana  
R. P. McGowan, Piedmont, W. Va.  
Mrs. Rob. Record, Seymore, Illinois  
Mrs. Henry Clark, St. Anthony, Iowa  
Mrs. A. L. Clark, Central Square, N. Y.  
Mrs. H. C. Blanaht, New Lathrop, Mich.  
Mrs. T. E. Alley, Sylvan Grove, Kansas  
Mrs. O. E. Albin, Kearney, Nebraska  
Mrs. H. Goebel, West Point, Iowa  
Mrs. J. S. Gilbert, Milton Junction, Wis.  
Mrs. L. E. Foster, Bedford, Indiana  
Mrs. Salanda Guncel, Osgood, Ohio  
Mrs. D. E. Williams, Pickering, Missouri  
M. H. Vining, Waterloo, Iowa

Remember these are only fifteen of scores and hundreds who at this moment are hustling out work and getting good money for it.

## You Who Read This

Haven't you often wished for a useful employment by which to make money in your spare hours? No doubt you know of people who would gladly pay you for weaving their rags into carpets and rugs.

It's not only the poorer people that have hand-woven carpets and rugs on their floors, but well-to-do people of city, village and country-side appreciate the handsome and useful products of home-weavers.

By canvassing among your friends you can work up a good business. Profitable, too. Besides, it's done at home with the children, where you can have an eye on everything in house and yard.

## It's Not Hard Work

Weaving with a Deen Loom is soon learned. The Loom itself is a simple affair, easily handled, and soon understood. May Vittum, Barclay, Kansas, says:

"I can weave almost twice as much as I could with the old loom. I would not go back to the old one for anything. The new one is faster, easier, and does the best work."

Having a steel frame well-braced, and rigid, it resists the shock and stroke of the shuttle mechanism, remaining solid for years without repairs.

It will accommodate any size rug or carpet demanded.

## What May Be Woven

Any design can be made in any number of colors that taste and fancy may dictate. You can weave rugs, hammocks, all kinds of hand-weaves, carpets, portieres, etc. The materials to use are common carpet warp which can be purchased of any dry goods store; carpet rags, old clothes of any kind, old ingrain and brussels carpets, blankets, or nearly any kind of fabric. Your customers furnish you all material; you do the weaving and get good pay for it.

## A Few Prominent Reasons for Buying

- 1.—You can make from \$2 to \$3 a day if you weave 8 hours daily.
- 2.—You can make from \$4 to \$10 a week using only part of your time—say evenings after work and an hour in the morning.
- 3.—We help you personally by letter if you wish. But this is seldom necessary, because we send you simple, detailed instructions with pictures of the loom and its parts. This book makes everything plain. You have no real difficulty in handling the loom.
- 4.—The Fly-Shuttle is easily filled, quick to handle, doesn't bother.
- 5.—The Winding Mechanism and Feed-Governor are new improvements. The latter keeps the warp and weft mechanism within control. It saves much material and prevents hours of thrown-away time used by old-style looms.
- 6.—It takes up much less room than many other styles. It requires a room but 10 feet square for a complete weaving shop.
- 7.—We send you everything with the Loom. You can go right to weaving as soon as you get warp and rags.

## You Needn't Pay All At Once

Pay something down. As Loom brings in profits send balance by easy installments.

Fill in the coupon and mail. We'll send our free catalog and a letter about our easy-pay plan.

## Honey Markets.

### GRADING RULES FOR COMB HONEY.

**FANCY.**—All sections well filled, combs straight, firmly attached to all four sides, the combs unsolled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

**A No. 1.**—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface solled, or the entire surface slightly solled; the outside surface of the wood well scraped of propolis.

**No. 1.**—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface solled, or the entire surface slightly solled.

**No. 2.**—Three-fourths of the total surface must be filled and sealed.

**No. 3.**—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct, to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent) cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

**ST. LOUIS.**—Since ours of Jan. 20 a light demand for extracted honey has been noticeable. Comb honey is, however, as dull as reported formerly. We quote: Fancy white comb honey, 15 to 16; No. 1, 14 to 15; amber, 13 to 14; broken and defective honey sells at considerably less. Extracted white, in cans, of which this market is bare, nominal at 8½ to 9; amber, in cans, 8 to 8½; in barrels and half-barrels, ¾ to 1 cent less if liquid. Granulated in cans and barrels is selling at ¾ ct. below above quotation. Beeswax, 27 for prime; all impure and inferior, less.

R. HARTMAN PRODUCE CO.,

Feb. 10. St. Louis, Mo.

**KANSAS CITY.**—There is some improvement in the demand for both comb and extracted; no change in price. We quote: Fancy white comb, 24 section, \$3.25 per case; No. 1 white comb, 24 section, \$3.10 per case; No. 2 white and amber, 24 section, \$2.75 per case. Extracted, white, 8 to 8½; dark, 6. Beeswax, 25.

C. C. CLEMONS & CO.,

Feb. 10. Kansas City, Mo.

**CINCINNATI.**—There is nothing particularly new in the honey market at this writing, for business in general is quiet. We are selling the very fanciest comb honey at 16 to 17½; fancy table honey, in crates of two 60-lb. cans each, at 9 to 10; amber honey, in barrels at 5½ to 7, according to the quality. For good beeswax, free from dirt, we are paying 28 cents cash and 30 in trade, delivered here. THE FRED W. MUTH CO.,

Feb. 14. Cincinnati, O.

**INDIANAPOLIS.**—Demand for best grade of extracted honey is good, while comb honey is meeting with slow sales. Very little honey is being offered by producers, and jobbers are carrying a very limited stock. Bottled goods in groceries find slow sales, which can be attributed to dull times; but there is another reason—many bottlers are making the mistake of putting out inferior goods. Jobbers are offering the following prices, delivered here: No. 1 and fancy comb, 16 to 17; extracted white clover, 9 to 10; amber in barrels, slow at 6 to 6½. Beeswax, 28 cents cash or 30 cents in exchange for merchandise. WALTER S. POWDER,

Feb. 20. Indianapolis, Ind.

**ZANESVILLE.**—The demand for honey is still rather slack—very little change since the last report. Prices show a little weakening, evidently indicating that commission men are anxious to realize on their stocks, even at a sacrifice. No. 1 fancy white comb brings at wholesale 17 to 18; very little demand for extracted except in small retail packages. Beeswax is very quiet; would accept small lots at 30 cts. in exchange for bee-supplies. EDMUND W. PEIRCE,

Feb. 20. 136 W. Main St., Zanesville, O.

**CHICAGO.**—There has been a better demand for comb honey this month; and while the prices are not over 16 to 17 for best grades of white it may clean up well at this range. Extracted is slow of sale at 8 to 9 for white grades; ambers, 6 to 7. Beeswax, 28.

R. A. BURNETT & CO.,

Chicago, Ill.

*Later, Feb. 20.*—The market is a dragging one; very few sales are being made, and those of small volume. There is really not as much demand as in previous seasons at this time, with a large supply in sight.

**DENVER.**—The demand for both comb and extracted honey has been rather light of late, but we expect it to improve soon. We quote: No. 1 white, per case of 24 sections, \$3.25; No. 1 light amber, \$3.00 to \$3.10; No. 2, \$2.75 to \$2.90; extracted, white, 9 to 10; light amber, 8 to 9; strained, 6¾ to 7¾. We pay 24 cents for clean yellow wax delivered here.

THE COLORADO HONEY-PRODUCERS' ASS'N,

Feb. 14. F. Rauchfuss, Mgr., Denver.

**SCHENECTADY.**—Our market is very quiet, with a limited demand for all grades. We expect some movement in buckwheat extracted for Jewish holiday later on. We quote: Fancy white clover, 15 to 16; No. 1, 14; mixed and buckwheat, 12 to 13; light extracted, 8½ to 9; dark, 7½ to 8. CHAS. MACCULLOCH,

Feb. 19. Schenectady, N. Y.

**SAN FRANCISCO.**—Prices are well sustained on all grades of honey, though there is no great amount of inquiry. Stocks are sufficient for all present demand, but are expected to be well cleaned up before the new crop comes in. Water-white, comb, 16 to 17; white, 15; water-white, extracted, 8 to 8½; light amber, 7 to 7½; dark amber, 6½ to 6¾.—*Pacific Rural Press*, Feb. 15.

THERE IS A SATISFACTION TO THE PRACTICAL BEE-KEEPER IN KNOWING THAT THE

**MUTH SPECIAL DOVETAILED HIVES,  
AND OUR OTHER SUPPLIES, ARE THE BEST MADE.**

### READ WHAT EXPERTS SAY OF IT

The Christmas mail brought me what is probably as useful and beautiful a Christmas present as I ever received—a morocco-bound copy of the new edition of the *A B C and X Y Z of Bee Culture*. Bee books and journals have come to my desk of which it seemed as though the least said the better. Not so with this book. On the contrary, it seems as though words were lacking to do it justice. There are many other bee-books, each filling its niche, but, in all the world, there is nothing so comprehensive as the *A B C and X Y Z of Bee Culture*. There is no point in the wide domain of apiculture that is not touched upon in this volume, and the information is the very latest and most authentic, well written and well illustrated. The amateur and the expert are both served equally well.—*W. Z. HUTCHINSON*, editor and proprietor of the *Bee-keepers' Review*, and author of *Advanced Bee Culture*.

No bee-keeper's library can be at all complete without a copy of this magnificent apiarian work. It has reached a sale of over 100,000 copies already, being the most largely sold book on bees in the world. Better send to us for a copy to read during the long winter evenings.—*American Bee Journal*.

This work of 536 pages is, as its name implies, a complete cyclopædia of every thing pertaining to bees and bee-keeping. It was originally compiled by A. I. Root, who in the 1877 preface, after stating his indebtedness to Langstroth, Quinby, and others, says that, "A great part of this *A B C* book is really the work of the people, and the task that devolves on me is to collect, condense, verify, and utilize what has been scattered through thousands of letters for years past." Since the first copy of this work appeared, now thirty-one years ago, it has undergone many revisions, and has had many additions, both of letterpress and illustrations, while the rapid advancement in bee culture has made it necessary in many cases to remove whole articles and rewrite them entirely. The revision has been ably carried out by E. R. Root, the present editor of *GLEANINGS*, who has had the assistance of a number of well-known and able men. In the preface the names of the writers of the different articles are given. For instance, we find Dr. C. C. Miller writes on honey-comb and out-apiaries; Dr. E. F. Phillips on the eye, parthenogenesis, and scent of bees; E. R. and H. H. Root on wax and wintering, both of these having carried out a number of experiments on these subjects. There are also articles by W. K. Morrison and Mrs. Comstock. It seems almost superfluous to say anything about a book of which already 100,000 copies have been sold; the simple fact speaks for itself that it fills a want, and is an attestation of its worth. Among the articles that have been revised we find the new methods of queen-rearing described, so that the practical bee keeper will have the latest and best ideas on the subject before him for reference. The new methods of wax-production are treated in an exhaustive manner, and as this subject is of more importance than formerly, greater space has been devoted to it. We have nothing but good words for this work, and recommend our readers to get a copy of the 1908 edition. The work is profusely illustrated and beautifully printed, and is a credit to the publishers.—By T. W. COWAN, Esq., editor of the *British Bee Journal*. Mr. Cowan is the author of two first-class books on bees and bee-keeping, "The Bee-keeper's Guide," and "The Honey-bee."

### THE UNITED FACTORIES COMPANY.

This firm is the result of a combination between eleven different factories, all located in the city of Cleveland, Ohio. The following have combined for mutual selling advantages: A buggy-top factory; a vehicle and harness factory; a handy wagon and steel-wheel factory; a paint and varnish factory; an incubator and brooder factory; an agricultural-implement factory; a metal roofing and siding factory; a sewing-machine factory; a fence factory; a stove and range factory, and a roofing factory. This combination proposes to sell its goods at factory prices direct to the consumer; and to reduce further the cost of selling they have combined to advertise as one concern. The offices are situated in the Whitney Building, Cleveland, from which a campaign of education in the line of direct purchase from the makers is being conducted. It has long been the desire of political economists to eliminate the middle-man; and the plan devised by The United Factories Co. seems the most reasonable and feasible of any that has been proposed. The readers of this journal have been favored with their advertisement of incubators and brooders, and from time to time we will publish small notices relating to other phases of their work. Write to them, mentioning this journal.

### SHUMWAY'S RELIABLE SEEDS.

It is our privilege to call attention to the annual spring catalog of seeds and flowers issued by R. H. Shumway, the great seedsman of Rockford, Ill. He started with seeds about the same time A. I. Root commenced to keep bees. By honesty and fair dealing he has succeeded in establishing a large trade in seeds throughout the middle.

### EGGS FOR SALE.

Through some oversight on our part, the advertisement of Frank C. Pellett, of Atlantic, Iowa, offering White Wyandotte eggs, was omitted from our Feb. 15th number. Please note his advertisement in this and succeeding issues.

## 4 PERCENT.

There is Nothing  
Speculative

about a savings account with The Savings Deposit Bank Company—

It is the one form of investment that does not fluctuate in value—

It is always there when you want it—

It is absolutely sound and secure—

It is the safest, most satisfactory investment your money can find.

Our booklet describes our methods and management, and explains the advantage of our simple banking-by-mail system.

## Catalogs Received.

Queen Land, a catalog of Italian bees and queens issued by S. Simmins, Heathfield, Sussex, England.

John Lewis Childs, Floral Park, N. Y.; general catalog of farm and garden seeds, more especially the former.

Seed Annual for 1908; catalog of D. M. Ferry & Co., Detroit, Mich. The annual announcement of an old reliable firm.

T. W. Woods & Sons, Richmond, Va.; catalog of farm and garden seeds; annual announcement of a celebrated seed-house.

O. A. D. Baldwin, Bridgman, Mich.; catalog of strawberry-plants and small fruits. Important to the strawberry-grower.

W. N. Scarff's catalog of profit-getting fruits, New Carlisle, Ohio. Mr. Scarff's catalog is always interesting. Send for a copy.

Seed-book of Fairview Seed Farms, Syracuse, N. Y. This is largely a vegetable-catalog, suited to market-gardeners and others.

Mary E. Martin, Floral Park, N. Y.; flowers for springtime. General list of flower-seeds. Don't pass this catalog by when ordering.

R. M. Kellogg Co., Three Rivers, Mich.; full catalog of strawberry-plants. Every berry-grower should send for this catalog at once.

Catalog of L. J. Farmer, Pulaski, Oswego Co., N. Y., for 1908. A list of berry and small-fruit plants; also farm fowls of pure breeds.

Portland Seed Co., Portland, Oregon; a general list of seeds, bee-supplies, and poultry requisites, sold by a thoroughly reliable concern.

J. C. Harrison & Sons, Berlin, Md.; catalog of fruit-trees. This is the catalog and price list of a firm famous for its nursery fruit-trees.

W. F. Allen Salisbury, Md.; catalog of strawberry-plants and other small fruits. No berry-grower should forget to send for Mr. Allen's catalog.

Bateman Mfg. Co., Greenloch, N. J.; catalog of 'Iron Age' farm and garden implements. Ought to be in the hands of all farmers and gardeners.

Hatching Facts, from Belle City Incubator Co., Racine, Wis. Catalog of 18 pages describing the Belle City Incubators and Brooders; also sprayers.

Green's seeds for 1908—catalog issued by E. C. Green & Son, Medina, Ohio (formerly The A. I. Root Co.). Our readers are all familiar with this catalog.

Johnson's Garden and Farm Manual for 1908. Full catalog; 219 Market St., Philadelphia, Pa. Of great importance to truck and market gardeners everywhere.

Continental Plant Co., Kittrell, N. C.; strawberry-plants, fruit-trees, grapevines, etc. This is from one of the leading berry-plant growers of worldwide repute.

The Good & Reese Co., Springfield, Ohio; trade-list for January to March 1. Roses, etc. Said to be the most extensive growers of rose-bushes in the world.

Spring catalog of H. H. Berger & Co., 70 Warren St., New York—a handsome catalog containing many novelties of a superior character; worth sending for.

The Barteldes Seed Company, Denver, Col.; every thing for farm and garden; bee-supplies; very interesting to all growers in the Rocky Mountain region.

Catalog of the Texas Seed House, Messrs. Reichardt & Schulte, Houston, Texas. Enumerates seeds adapted to Texas, New Mexico, Oklahoma, and Louisiana.

Mills' Seed Catalog for 1908; a full general list of farm and garden seeds by F. B. Mills, Rose Hill, N. Y., Pennsylvania, New England, and New York readers, please note.

Thorburn's Seeds; a beautiful catalog issued by J. M. Thorburn & Co., 33 Barclay St., New York. One of the handsomest catalogs we ever saw. The covers are a work of art.

Currie Bros. Co., Milwaukee, Wis. Farm and Garden Annual, or general catalog of seeds. Our Northwestern readers can not very well overlook this list of every thing for the garden.

Seeding machines, from The Wayne Works, Richmond, Ind. No farmer should fail to send for a copy of this beautiful catalog.

Seeds and Bulbs for 1908, issued by A. C. Kendal, 2010 Ontario St., Cleveland, Ohio. Very suitable for farmers and others in Northern Ohio.

Catalog of The Gem Incubator Company, Trotwood, O., U. S. A. A first-rate catalog of incubators and other poultry culture tools.

The Iron Age Farm and Garden Implements, from the celebrated Bateman Mfg. Co., Greenloch, N. J. Too well known to require any praise.

Henderson's Farmer's Manual for 1908. This, as its name implies, is a catalog of seeds for the farm—not for the garden. Worth sending for by farmers.

Catalog of the Model Incubator Co., Chas. A. Cyphers, President, Buffalo, N. Y.—two catalogs gotten up in handsome style, and well worth sending for.

Price list of L. J. Farmer, Pulaski, Oswego Co., N. Y. This is not a catalog, but a price list of raspberry, strawberry, blackberry, and other small-fruit plants.

Poultry for Profit, by J. W. Miller & Co., Freeport, Illinois. This is a very handsome catalog of 130 pages devoted to the sale of incubators and fancy fowls.

Charles A. Green, Nursery Company, fruit-book and catalog, Rochester, N. Y. An excellent but unpretentious catalog of fruit-trees, etc., for the temperate zone.

Illustrated catalog of the Jackson County Nurseries, Bosky Dell, Ill.—devoted to strawberry, apple, peach, pear, plum, grape, cherry, raspberry, and other fruit-plants.

Hardy fruit and ornamental trees, shrubs, vines, and roses, by T. J. Dwyer & Co., Cornwall, N. Y. This is the general catalog of the famous Orange County Nurseries.

The Improved Raney Canner catalog sent by The Raney Canner Company, of Chapel Hill, North Carolina. Valuable to those who want to can fruits on a small scale.

Farm and Garden Implements, Planet Jr., issued by S. Allen & Co., Philadelphia, Pa. Annual catalog of the famous Planet Jr. tools for farmers and gardeners.

Fourteenth Annual Poultry-Book and catalog of Successful and Eclipse Incubators and Brooders. (English Edition.) Des Moines Incubator Co., Des Moines, Iowa.

Johnson's Wholesale Trade Price List for 1908—intended for circulation among truck-growers and florists who require considerable quantities of seeds. Address, 217 Market St., Philadelphia, Pa.

Annual catalog of The Famous Old Trusty Incubator and Brooder, manufactured by the M. M. Johnson Co., Clay Center, Neb. Special catalog of nearly 200 pages with much information of value.

Sure-Hatch Incubator Co., Fremont, Nebraska—a large annual catalog of incubators and poultry-supplies. This is a large catalog of nearly 100 pages about the same size as those of this journal.

Trade Price List for 1908 of Livingston's True Blue Seeds. This is from the great tomato specialists, The Livingston Seed Co., Columbus, O. If you are in any way interested in tomatoes, send for it.

Elwanger & Barry, Mount Hope Nurseries, Rochester, N. Y. General catalog. The usual spring catalog of this famous firm. Also "How to Have Roses," by the same firm. Well worth sending for.

Henderson's Implement Catalog for 1908. As its name implies, it is a complete catalog of agricultural and horticultural tools; also books on rural life and welfare. Henderson & Co., 35 Cortlandt Street, New York.

How to Save One-half the Time, the Labor, the Cost of Hatching and Rearing Chicks by Artificial Incubation. This is the annual catalog of the H. M. Sheer Company, Quincy, Ill. Ships incubators knocked down.

Excelsior Incubators, Brooders, and the Wooden Hen, by Geo. H. Stahl, Quincy, Ill. This catalog extends to 208 pages. The name of Stahl is well known to American poultrymen, in connection with poultry supplies.

## A HOME INDUSTRY.

Many men and women are looking and longing for some profitable industry which they can pursue without leaving home or separating themselves from their families. In this connection there are very few industries which will in the long run surpass poultry culture, and by that we mean turkey and duck raising as well as chickens.

This industry has two great advantages over most pursuits of the kind. First, but little capital is required to start with; and, second, there is a market for the products almost everywhere. One may start with an incubator such as is made by the George Ertel Co., Quincy, Ill., for \$7.85, delivered at any railroad station east of the Rockies. This holds 100 eggs which is ample for a beginner.

The catalog issued by the same concern is really a treatise on poultry, and ought to stimulate farmers very greatly to make far greater efforts than they have hitherto done to make the chicken business not only profitable but a pleasure besides. Write to the Ertel Co., mentioning us.

## EVERGREEN WINDBREAKS FOR THE BLIZZARD BELT.

Nothing is doing more to improve farm life in the "blizzard belt" than the planting of hardy trees. This is particularly true of trees suitable for windbreaks to shelter man and beast from trying prairie winds. Crops, too, are sheltered, and in time the

whole aspect of the country will be changed by tree-planting, giving not only a pleasing and attractive appearance to the landscape, but also doing much to make life more agreeable to all the inhabitants thereof. The treeless prairie is being rapidly changed into a beautifully clothed landscape at comparatively small expense. In the matter of fruit-trees, equally good results are being accomplished, and all parts of the earth have been ransacked to find fruits suited to the extremely trying conditions of our Northwest. One of the foremost workers in this line of human endeavor has been The Gardner Nursery Co., of Osage, Ia., who started at the problem 38 years ago, and who may be said, without prejudice, to have mastered that problem very satisfactorily. It is worth while encouraging such a firm with an order—the more so when you help yourself by doing it. It will pay you to write this firm for information concerning trees.

## TO THE LADIES.

We desire to call special attention to the advertisement of the American College of Dressmaking, Kansas City, Mo. It appears on page 301 of this issue. We have carefully examined their literature, and we see no reason why any person with a natural aptitude for dressmaking may not learn this trade by this system of instruction by mail. There are many who will be glad to avail themselves of the offer now being made by this college of dressmaking.

# NOT A PARROT.

A parrot simply repeats. The *Bee-keepers' Review* does repeat some of the good things to be found in the other journals, but it does more—it comments upon them. Each article is appropriately introduced; the reason given why it is considered worthy of production; and, at its close, the salient points are enlarged upon, praised or condemned, as the occasion demands, and additional thoughts, views, and experiences given at length. Sometimes a short extract does little more than

## FURNISH A TEXT

for a long editorial. In this way the extracted department is raised from a mere parrot-like repetition of what appears in other journals to one that has life, personality, and vim.

All of the journals are carefully read, and every thing of any importance is noticed in *some* way. Often the

## KERNEL OF A LONG ARTICLE

can be given in a short editorial. Sometimes an article can be condensed, or a few paragraphs given, accompanied by editorial comment, and all be made clear. Occasionally an article must be given entire in order to do the subject justice, but some comment or criticism may add greatly to its value.

Years ago Mr. Heddon used to say that, if some one in whom he had confidence could read all of the bee-

journals, select the articles that were of real value, and gather them together into one journal, he would gladly

## PAY TEN DOLLARS

for such a journal. This is exactly what the *Review* does, at least it gives, in *some* form, all that is most valuable in all of the journals—hence its name.

A man who is making a business of bee-keeping ought to read *all* of the bee-journals; but if only one journal is to be taken, then the *Review* fills the bill most completely.

If you wish to see how *completely* the *Review* covers the whole apicultural field, yet how far it is removed from a mere parrot-like repetition, just try it for one year. It will cost only \$1.00, and all of the back numbers for 1907 will be sent *free*, in the bargain. In other words for \$1.00 you can get the *Review* for 1907 and 1908; and when you have sent your dollar, and received the back numbers, look them over carefully; and if you would then rather have

## YOUR DOLLAR BACK

than to have the *Review* keep on coming for the rest of the year, just drop me a postal and I'll return the money, and you may keep the back numbers, and welcome.

W. Z. HUTCHINSON,

..

..

FLINT, MICH.

## QUEENS FOR 1908

J. E. HAND, the veteran bee-keeper and EXPERT QUEEN-BREEDER, will devote a part of his time the coming season to the rearing of CHOICE QUEENS from a superior strain of LONG-TONGUE RED-CLOVER ITALIANS that have

gained a world-wide reputation for HARDINESS, GENTLENESS, AND SUPERIOR HONEY-GATHERING QUALITIES. Watch for his ad. It will open your eyes to a few points in queen-rearing that will save you dollars.

By the way, did you notice the list of goods that we are offering at a SPECIAL rate in Jan. 15 Gleanings? Look it up.

**M. H. HUNT & SON, Redford, Mich.**

## TO THE BEE - KEEPERS OF CANADA.

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the QUALITY. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, The best is cheapest."

CHEAPEST,
AND LARGEST
SMOKER SOLD
FOR A DOLLAR

The perforated side grate seen above holds a removable, metal, asbestos-backed fire shell, preventing burning the tin off the outer case, and deflects the air at right angles, preventing back draft to the valveless bellows. The air, passing to the back and over the top, cools and expels the smoke, fanning the burning fuel at top or side till all consumed, giving cool smoke for hours from one filling. It can't clog. No top-heavy cap to choke with soot; no valve to fail; no holes shedding sparks or hot ashes.

Four years' sales prove its success beyond a doubt, expensive dies making it uniformly perfect as possible to devise. We confidently guarantee full satisfaction or refund the price.

Price, \$1.00; 3 for \$2.50; by mail, add 25c. each

Send address of yourself and Bee friends for 8-page leaflet on "Smoker," and facts about Bees and Queens, 80 pages, free.

THE MUGLER ENGRAVING CO.
MUGLER BLDG. CLEVELAND, OHIO.

FREE! 50 lbs. Comb Foundation FREE!

WEED'S NEW-PROCESS COMB FOUNDATION.

PRIZES GIVEN AWAY

ABSOLUTELY FREE IN A CONTEST.

FIRST PRIZE—25 lbs. Comb Fdn.

THIRD PRIZE—5 lbs. Comb Fdn.

SECOND " —10 lbs. Comb Fdn.

FOURTH " —5 lbs. Comb Fdn.

FIFTH PRIZE—5 lbs. Comb Fdn.

THE ABOVE PRIZES will be given absolutely free to those who will make the largest number of words out of the letters found in the name "Toepperwein." The letters may be used over as many times as desired, but in no single word oftener than found in the name "Toepperwein." Only words found in Webster's dictionary are admitted. The words must all be plainly written in columns, and numbered.

This contest is absolutely free to any one and anywhere. It is a fair contest, and one has the same chance as the other. These contests are very instructive, and just the thing for schoolchildren to pass the evenings. The contest will close May 1, 1908, and all lists with words must then be in, and in May 15th GLEANINGS the results will be published, giving the names of the winners and all the words of the one who wins the first prize. The winners have the privilege of choosing any grade of foundation. We feel confident that the winners will be highly pleased with the prizes, as the comb foundation is as fine and perfect as any machinery can make, and is made right here in our factory out of this clear Southern beeswax.

Now do not lay this aside and put it off until some other time, but begin right now and start the list. Write the words in a little memorandum-book and carry it in your pocket; and every time you think of another word mark it down. There are a great many words to be made out of the name "Toepperwein," and you have just as good a chance as any one else; so do not let any time go by, thinking some one else may have more words. Now, understand you are welcome to enter this contest, no matter whether you own bees or not, nor whether you are old or young, nor where you live. In case any of the winners have even numbers, then the amounts will be equally divided between such winners.

ROOT'S BEE-SUPPLIES.

We always carry a large and complete stock of The A. I. Root Co.'s make of bee-supplies at Root's factory prices. Write us for illustrated catalog and price list.

HONEY AND BEESWAX.

We buy honey and beeswax at all times. If you have any to offer, write us stating quantity you have, quality, and your best price delivered at San Antonio. We also work beeswax into comb foundation by the pound at reasonable rates. We should like to have some business from associations in other States who have large quantities to work up. Our capacity is 500 lbs. per day.

We have just received a set of new machinery, and our *Weed New Process Foundation* is perfect and gives perfect satisfaction everywhere.

Whenever you are in San Antonio make our office your headquarters and let us show you through our plant. Stay here a while and meet the bee-keepers as they come in. You are always welcome and will be courteously treated.

UDO & MAX TOEPPERWEIN,
1322 South Flores St. SAN ANTONIO, TEXAS.

**"If goods are wanted quick, send to Pouder."
Established 1889.**

"Bee Mindful"

By the Bee Crank.

The bee is never caught napping when spring opens. It goes to sleep in the fall, dreaming of busy days among the first flowers.

When the bee is so mindful of the "Get Busy" maxim, what a comment on man who forgets the "Never Put Off" doctrine until he stares "to-morrow" in the face.

This timely hint from Nature ought to stick and bear fruit. It ought to send you, Mr. Bee-keeper, out among your hives, taking notes of what you will need this season. These needs should be placed on paper and sent at once to Pouder, the friend of the "rush-order" man.

Quick delivery is one of my hobbies—my favorite one. I am located in the center of population of the United States—at the hub of the wheel, with a railroad following every spoke. That, and my policy of always carrying a full line of

bee-keepers' supplies ready for immediate shipment, explains my everlasting sticking to my quick-delivery hobby.

ROOT'S GOODS at ROOT'S PRICES, Danzenbaker hives, section-boxes, metal-spaced frames, bee-smokers, bee-veils, and so forth.

I pay highest market price for beeswax, and a postal brings my new catalog.

A. L. BOYDEN, ADVERTISING MGR.
J. T. CALVERT, BUSINESS MGR.

Vol. XXXVI.

MARCH 1, 1908.

No. 5

STRAY STRAWS

by Dr. C. C. MILLER

HAS NOT a frame-spacer (No. 8) got mixed up with rabbit-spacers in A B C and the X Y Z of Bee Culture, p. 208, edition 1908?—a good frame-spacer too.

MOST HUMBLE apologies, Mr. Editor, for misunderstanding what you said, and heartiest thanks for the taboo, p. 200, upon the word "section" when referring to a shallow brood-chamber.

BIENEN-VATER, p. 21, says American bee culture takes the lead because of the frames in use here, the three most important being the Langstroth, the Dadant, and the Danzenbaker. It prefers the Danzenbaker.

HONEY from combs not yet bred in can generally be distinguished easily by the taste from that extracted from dark brood-combs, says F. Greiner, *Bienen-Vater*, p. 15. [We should be glad to hear from our subscribers on this subject.—ED.]

REV. A. STRAULI says, *Deutsche Ill. Bztg.*, 7, that Mr. Cowan, who has given Italians high praise in the "Bee-keeper's Guide Book," has written him that he endorses the Swiss Kramer in believing that, with right cultivation, blacks excel Italians in that climate. Rev. Strauli also says, apparently on the authority of C. P. Dadant, that "there are also in America very good black colonies."

"FORMIC ACID (the acid of bee poison)," p. 202. But—but, don't later authorities tell us that the poison is something else than formic acid, or is there formic acid along with the poison? [You are correct. Later authorities are raising the question whether the poison of the bee-sting is formic acid. It seems to us this ought to be easily settled by

the chemists. If one stinging will not be enough for a test, a hundred or a thousand can be secured.—ED.]

V. WUEST, *Deutsche Ill. Bztg.*, p. 8, thinks there is no proof that the nectar of poisonous plants is harmful to bees. He imprisoned a queen and twenty workers, and for three days fed them exclusively on nectar that he took from "crown imperial," well known to be very poisonous, but no harm followed. Like experiments with tobacco and "herbstzeitlose" showed their nectar also harmless to the bees.

ONE SECRET of the success of W. L. Cooper's bee-cellar, p. 214, is the abundance of good air with those four ventilators. A. I. Root is just right as to the importance of fresh air, and lots of it, for man or bee. [We are glad you called attention to this question of ventilation. In looking back over the article we find that Mr. Cooper makes use of a good deal of ventilation, and therein he is very wise.—ED.]

WONDERFUL times, these. After weeks of the most bitter contest in which there was the remarkable spectacle of the Speaker of the U. S. House of Representatives coming in person to help the political bosses to defeat the will of the people plainly expressed by their ballot, the people have finally triumphed, and Illinois has a primary law sending the bosses to the rear, and leaving to the people to say who their candidates shall be.

I AM SURPRISED at the difference between Allen Latham's experience, p. 212, and mine as to feeding thick syrup late. He found 5 to 3 about the right proportion, 5 to 2½ (2 to 1) being too thick for the bees to take well. Years ago I fed much syrup late, and always as thick as 5 to 2, and there was no trouble about the bees taking it. I wonder if there was a difference as to time, or was it the acid I used, or what? [Years ago we fed a 2-to-1 sugar syrup to our bees without any difficulty. The thicker the syrup can be, and yet have the bees take it, the less strain there will be on the bees in evaporating down to the requirements of the hive; for we are beginning to believe that a thick syr-

up, notwithstanding our late expressed opinion, may be better than a thin one which the bees are required at some expense to their vitality to reduce down to the body of ordinary honey.—ED.]

WHEN ROBBERING occurs, the orthodox teaching is to lessen the entrance, that the colony may the better protect itself. That heretic, Allen Latham, says in *American Bee-keeper*, 35, that he stopped robbing by making the entrance larger! He explains it by saying that the odor of the honey is less concentrated with the larger entrance, attracting the robbers less. Now comes very excellent authority to his support in that last paragraph, GLEANINGS, 227. [While it may be wise in some cases to widen the entrances of strong colonies we are sure that, in the case of nuclei, it would be folly after the honey-flow to use any thing but a small opening, the smaller the better. We have tried this thing too many times with nuclei to venture risking them again.—ED.]

"TO HEAT a can of honey on an ordinary stove-mat . . . would be attended with a great deal of risk," p. 233. Well, then, take two or three mats. [Three mats might be better; but is there not a possibility that the fire might be so hot that the honey would be injured over the three mats? It is much easier to regulate the temperature of the water heating the honey than that of the mat. As we all know, this question of liquefying candied honey involves the danger of getting the temperature too high while the process is going on. If the honey be melted on the mat, or two or three mats, how can one determine whether or not the honey is overheated? If, on the other hand, it be liquefied in a vat of water, the temperature of which does not go above 130, then you can be sure that the honey has not been heated above that point. But there is another objection: Honey when heated over a mat necessarily has the heat concentrated over a comparatively small area, while the same honey in a vessel immersed in water nearly up to its top has the heat scattered over a far larger area. In a given time, 125° Fahr., when the vessel is in water, would probably do the same work as 140° F. concentrated all in one spot, with the advantage that the 125° would preserve much better the delicate aroma of the honey.—ED.]

A SPACE of $\frac{1}{4}$ inch between bottom-bars is objectionable in sectional hives because one can not "look up between the combs when the brood-chamber is lifted up." I see; but what good reason is there for having more than $\frac{1}{4}$ -inch space between bottom-bars between Langstroth frames? [If wider spaces between the top-bars are a decided advantage in the case of a shallow brood-chamber, there ought to be some advantage in a full-depth chamber, though to a less extent. Only yesterday, Feb. 14, we were inspecting an apiary where the bees wintered outdoors. The owner, in order to give me an idea of what was going on, tilted one hive off the bottom in order that we might look under.

The bottom-bars of this hive were $\frac{3}{4}$ inch wide, leaving a space of $\frac{1}{8}$ inch between the bars. One could easily see quite a distance up between the combs. Now, suppose between the bars there had been a space of only $\frac{1}{4}$ inch; think you we could have obtained as satisfactory knowledge of the condition of the colony?

Some years ago when this question came up we called for a show of hands from our subscribers. The general verdict favored a bottom-bar $\frac{3}{4}$ inch wide, for the very reason here given. A bottom-bar $\frac{3}{8}$ inch square was considered better still in one respect in that it favored the building of comb clear up to the bar; but too many times the combs were built beyond and therefore $\frac{1}{4}$ inch was regarded as the golden mean.

It follows then that bees are more inclined to build comb down to a bar $\frac{3}{4}$ inch than to one $1\frac{1}{4}$ inches wide. But you say that is of no consequence with you because you use full sheets of foundation running clear to the bottom-bar, stayed with wooden splints; but the majority of bee-keepers do not use such full sheets.

Unless we are very much mistaken, doctor, you are in a very small minority in using and recommending a bottom-bar as wide as the end-bar, which, as we remember, is $1\frac{1}{4}$. At all events, if you use $1\frac{1}{8}$ inch spacing from center to center, this would make the bottom-bars as well as end-bars $1\frac{1}{4}$ with a spacing of $\frac{1}{4}$ inch between.—ED.]

ONE MAN SAID at the National convention that he put his bottles of honey in a water bath warm enough so he could stand having his hand in it—about 140 degrees. Another man said that would take the skin off. I thought I would find out. Took a dish of water at 134 degrees, held my hand in it for 5 seconds; at 133 I held it 10 seconds; at 130, 15 seconds; at 125 I could let it remain permanently. Then I raised it to 140 degrees and held my hand in it 5 seconds; but it was pretty hot. All hands, however, are not alike. [Why didn't you hold your hand in water heated to a temperature of 140 longer than five seconds? That is not *holding* your hand, but *dipping* it in water and taking it out almost immediately. We still insist that the average person—no, we will say the average *man*—can not hold his hand in water heated to 140 Fahrenheit, without having the skin come off. There is a great difference, however, in persons. For instance, Mrs. Root will hold her hand in water quite a number of degrees hotter than your humble servant. How do we know? When suffering from a severe headache she will wring a cloth bandage out of water so hot (and do it with apparent comfort) that would remove the skin from her husband's hand. The same temperature will not affect her hands in the least.

Some years ago, when we were heating water with a steam-pipe to scald out infected hives, we found we could not get it much above 180, and consequently we gave up that method of heating water to scald out the hives; but during these experiments we

carefully tested the hands in water at various temperatures, because we had heard bee-keepers say so many times that honey must not be liquefied in water hotter than may be born by the bare hand. A temperature of 140 was too much for us, and, like you, we could not bear the hand for any length of time in water hotter than 125 degrees; but we suspect that your wife might be able to stand it considerably hotter. As a general thing we think it much safer and better to refer to actual degrees measured by a thermometer, for then there will be no danger of injuring the flavor of the honey. A temperature of 140 degrees, if prolonged, affects slightly the bouquet, hence 130 or even 125 would be still better.—ED.]

I'VE LIVED to see the time when a President of the United States dared to say a word against the saloon in his message. I give it at second hand. A newspaper man was interviewing Rev. A. C. Dixon, pastor of Moody's Church, Chicago:

The minister reached for a newspaper containing President Roosevelt's message in full. He glanced through the long columns and finally came to something that held him.

"Ah, here it is," he announced. "I do not suppose one man in 10,000 knows that the President says something in derogation of the saloon in his message, but he does. Let me read: 'Just as the blackmailer and bribe-giver stand on the same evil eminence of infamy, so the man who makes an enormous fortune by corrupting legislatures and municipalities and fleecing his stockholders and the public stands on the same moral level with the creature who fattens on the blood money of the gambling-house and the saloon.' There it is, right there—'gambling-house and saloon,' and I am mighty well pleased to see the President of the United States placing the saloon in the right place and condemning it as he has. I do not know that other Presidents have had the courage to mention the saloon, but Roosevelt did, and he is entitled to the thanks of the law-loving people of the land."

IN GERMANY an advertisement appeared offering for 25 cents to send a recipe for making 2 lbs. finest honey from 1 qt. of buttermilk. Remittance of 25 cents brought the instruction to add 1 lb. of sugar and boil slowly two hours, stirring constantly, in a brass, copper, or enameled kettle; but the enameled kettle must not be cracked inside. Pretty good for a German; but a Yankee fakir would follow it up with an advertisement offering for 50 cents to sell a recipe to produce for less money a better honey than the buttermilk thing. The recipe would read, "Go to a grocery and buy it." "That wouldn't cost less?" Figure up and see.

1 qt. buttermilk.....	1 cent
1 pound sugar.....	5 "
2 hours stirring at \$1.50 a day....	30 "

Cost of 2 lbs. buttermilk honey....36 "

[These so-called artificial honeys, unless glucose be made the main constituent, cost considerably more than genuine honey. But glucose can not now be used except as an adulterant, the mixer to consume it in his own family. Or if sold for general consumption it must be used as a mixture of honey and glucose, stating the mixture of each.—ED.]

MR. E. E. COVEYOU, in the last *Review*, shows a practical scheme for filling square honey-cans automatically, and shutting off the honey-gate just the moment the honey reaches a certain level in the can. We hope to illustrate it later.

THE editor of the *Review* is somewhat skeptical as to the success of the plural-queen system, saying he can not see any thing to balance the labor and cost. He admits that the scheme may be possible but not profitable. This is an open question, and we will allow the discussion to continue for a time longer.

LABELING THE WEIGHT.

SWIFT & CO., the meat-packers, have begun a suit to test the legality of the Nebraska pure-food law which compels them to label the weight on ham and bacon pieces. Comb honey in sections would seem to come under the same category—at least, if a ham has to be labeled, a section of comb honey ought also to be.

W. K. M.

OUR SPECIAL SPRING-MANAGEMENT NUMBER.

ONE of our late advertisements states that our symposium of articles on spring management will appear in our issue for March 1. We did not discover the error until it was too late. The series will appear in our March 15th number, and it will be well worth reading, as the articles comprise many valuable hints and suggestions from our veterans in the field.

A WORD TO OUR SUBSCRIBERS—ESPECIALLY THOSE WHOSE SUBSCRIPTIONS MAY HAVE EXPIRED.

THE editor has been going over our list of subscribers, and has been very much gratified to see that it is well paid up. The number of delinquents—that is to say, those who have not paid up arrearages or back subscriptions—is very small. We were surprised, also, to notice how large a number have paid in advance—some clear up to and including 1915. One man in particular paid for twenty years ahead. So many of the number having paid in advance leads us to believe that our journal is appreciated. We have no doubt that those who are behind like it just as well, but perhaps have neglected to send in their back dues.

It is not nor has it been our policy to continue sending our journal after the time paid for to any particular person unless we consider him responsible, and believe that he desires its continuance. The few delinquents

that we have we consider to be people who will renew again, paying cash for all back subscriptions, and a substantial advance. But according to a recent ruling of the Post-office Department we shall be no longer permitted to send GLEANINGS after the time paid for, except under certain conditions. The Department appears to have no desire to handicap publishers who are sending out a legitimate publication to *bona-fide* subscribers; but it is, in a very substantial way, recording its stamp of disapproval against sending any publication, especially one of the cheap class designed for advertising purposes, to people who may not care for it. Or, to put it another way, Uncle Sam says no publisher shall try to force a paper on to some one who has not ordered it, and then try to collect payment by coercion — and he is right.

As we do not wish any subscriber to lose a single copy of the journal, we respectfully request all delinquents who know they are behind in their subscription to send in their remittance at once.

HOW THE PURE-FOOD LAW WORKS.

The following excerpt from the *Detroit Free Press* will explain as well as any thing can just how the pure-food laws help the honey-producer:

LOOK FOR "NEAR HONEY;" MANY BARRELS OF SPURIOUS PRODUCT CONFISCATED BY FEDERAL OFFICERS.

Acting upon instructions from Washington, Deputy United States Marshals Cassius P. Taylor and Duncan Lyons started out yesterday afternoon to seize large quantities of "near honey," which is said to have been passing for genuine strained honey with many wholesale users of the article in Detroit and other cities throughout the country.

The manufacturers of the alleged spurious article are said to be Rogers & Holloway, of Philadelphia, and it is in a crusade against the manufacture of what is said to be a mixture of cane and honey that the seizures are being made in many places.

Eight barrels of the stuff were found in one factory, where it has been used in composition with other articles; six barrels in possession of a commission merchant; nine barrels at another manufacturing plant, and 200 cases of fifty pounds each at still another factory.

This composition, if sold to the public, is in violation of the federal pure-food law. The quantities confiscated in this city will be held pending the outcome of the case against the manufacturers. W. K. M.

CORN SYRUP VERSUS GLUCOSE.

APPARENTLY the glucose people have won out in their contention—that is, the privilege of calling glucose "corn syrup." When Dr. Wiley and his associates rendered an adverse decision, the glucose interests bombarded the Board of Food and Drug Inspection, Secretary Wilson and President Roosevelt, asking for a reversal of the ruling. A decision has finally been rendered, favoring the glucose interests, all the members of the Board of Food and Drug Inspection agreeing, including Secretary Wilson, Cortelyou, and President Roosevelt, Dr. Wiley alone dissenting. We are surprised at this, because if the anti-glucose interests had put in a strong protest the result would have been different.

We suppose this means that the glucose

interests may continue to label their product "corn syrup," which name has not obtained such an unsavory reputation as glucose. The bee-keepers of the country made a vigorous protest, but, apparently, without effect. After all, it will be only a question of time when it will be discovered that "corn syrup" is no more palatable than the same thing under the old name—*glucose*.

THE DEATH OF TWO VETERAN BEE-KEEPERS.

IN our last issue, in the department of Special Notices we announced the death of the veteran Henry Alley, practically the last representative of the early days of modern bee-keeping in the United States. We regret to record also the death of the veteran E. France, father of N. E. France, General Manager of the National Bee-keepers' Association. He was 84 years of age at the time of his death, the same taking place on Feb. 7, at 9 A.M. He was quite a prominent writer for GLEANINGS in the early 80's. We hope to be able to give an extended sketch of both, perhaps in our next issue.

LIQUEFYING CANDIED COMB HONEY WITHOUT MELTING THE COMBS.

We are experimenting on a method which we hope will enable us to liquefy honey candied in sections *without at the same time melting the combs*.

The plan involves nothing more nor less than keeping the sections of candied honey at a temperature of 100 or 102 degrees for a week at a time. A four-days' test of sections placed in a large incubator set at a temperature of 102 shows that the honey is rapidly liquefying without destroying the combs. We hope that, in a few more days, the honey will be perfectly liquid and the combs intact. Of course, where the cappings are cracked there will be nothing in particular gained in bringing the honey back to a liquid condition.

The principle can be carried out on a large scale by constructing a room and having the same heated by means of a steam coil or coils, or a furnace. The temperature of the room must be *uniform in every portion*, and uniform throughout the day, and it must not go above 102 degrees.

Do not jump to the conclusion that this is going to prove to be an unqualified success. We don't know. Just wait until the next issue and we will tell you how it works. If a success it will save hundreds—yes, thousands—of dollars on comb honey made unsalable by reason of candying.

STRAWBERRIES PRESERVED IN HONEY ONLY.

We have just been eating some strawberries preserved in nothing but honey, put up by Mrs. Frank McGlade, Hebron, Ohio. The jar from which we took the fruit was labeled 1906; yet on this 11th day of February, 1908, there was not a particle of mold on top. We are of the opinion that the berries would have kept several years longer.

Mrs. Root remarked that these strawberries, unlike those preserved in sugar syrup, had almost their natural color. This is all the more remarkable because the jar has been standing on the desk of the editor, in the full glare of three windows through which the sun often streams in. The temperature of the office seldom goes below 70°, and yet this fruit has stood thus for nearly two years. Had it been put in a cool dark cellar the natural color would have been still more pronounced, no doubt.

It will be remembered that Mr. Frank McGlade wrote an article on preserving fruit in honey. Referring to these particular strawberries, and how they were put up, he said:

Our own experience here in our home has been very satisfactory in the use of honey in canning and for making preserves. Of course, we do nothing in a commercial way, but every year Mrs. McGlade puts up whatever fruit she desires, in honey—strawberries, currants, peaches (canned and preserved), and jellies. Strawberries preserved in honey are about as fine eating as I ever expect to get in this present life. As to the keeping qualities, we have them of various ages—two and three years old, and none spoil. The fruit is handled the same as when sugar is used. We have put the honey over the fruit and let it stand all night before cooking; again, after the fruit is cooked the honey has been put in. Either way proved entirely satisfactory. We use about the same amount of honey as of sugar. If you can make preserves, jellies and jams with sugar you can with honey. There certainly is an excellent field here for an enterprise in a commercial way which can not help yielding large returns. The people are willing to buy that of which they have the assurance of purity.

For further particulars the reader is referred to page 1176, Sept. 15, 1906.

SOME OF THE SILLY ARGUMENTS AGAINST PARCELS POST.

ALL sorts of criticisms have been and are being hurled at the parcels-post proposals. The latest is that it pays only in countries having a small area. For example, the *Irrigation Age*, which is an excellent paper, compares the British Islands with Ohio, Indiana, and Illinois, which latter are 12,000 square miles larger than the Britannic Islands of His Majesty King Edward.

These critics forget that the British parcels post extends over an area three times as large as the United States. It embraces Canada, West Indies, Australia, India, South Africa, Central Africa, and various other colonies, so that this criticism has no foundation on which to rest.

In the instance of France, the case is not much different. The word "France" includes Algeria, an immense country, the French West Indies, and Indo-China, an area of land as large at least as the United States. But we can go nearer home, for Uncle Sam has a parcels-post service with many countries. We have every reason to believe this service is done in first-class style and at much lower rates than any express company would do it; and a curious fact in this connection is that the foreign rates for parcels post are lower than the domestic. To make this clear we will instance an hy-

pothetical case. If The A. I. Root Company wants to send 4 lbs. of foundation to a customer in Ohio the charge is 64 cents; but if the customer lives in Central America, or some other far-away country, the charge would not exceed 48 cents.

We understand that Senator Platt, who "owns" two express companies, has already boasted that there would be no parcels-post legislation at this session of Congress. The National Grange is behind this movement, and it is bound to win. It would go through a good deal sooner, however, if the farmers would give their Congressman to understand that they fully expect him to do all in his power to help this reform in our postal laws, for it is only a reform, nothing more. We have parcels post already, and have had it for years; but the rate is too high for it to be a success. It was purposely made so to suit the express companies; but the necessity for protecting their business has long since ceased to exist.

THE COST OF PARCELS POST.

One of the stock arguments against the parcels post is its cost, and quite a number are being misled into the belief that it will result in a great postal deficit. Now, what are the facts? Great Britain, with an immense business at very low rates, has an annual postal *surplus* now of not less than \$20,000,000, and in one instance we believe it was \$35,000,000. Germany also has a very liberal parcels post arrangement, and her annual *surplus* over all expenses is nearly \$15,000,000. France usually has a postal *surplus* of something like \$10,000,000, though she too has liberal parcels-post facilities.

It is the United States which has always a postal deficit which Uncle Sam's treasury has to make good. Parcels post would, to a very great extent, stop this deficiency, and put the postoffice on a paying basis. Many small postoffices would begin to pay or hold their own if we had a true parcels-post system such as a great nation ought to have.

In any event, bee-keepers have a use for a parcels post; so have the egg-raisers; and even the butter-makers can despatch their goods by parcels post to customers. We are going to have it.

PARCELS POST IN THE SENATE.

Senator Burnham, of New Hampshire, on Feb. 10 introduced a bill in the national Senate authorizing a parcels post on rural routes. The bill has the endorsement of President Roosevelt and Postmaster-General Meyer. It provides for a rate of 5 cents for the first pound, and 2 cents for each additional pound. The limit is 11 lbs. On the same date Senator Kean, of New Jersey, introduced a bill providing for the lowering of the present parcels-post rate from 16 to 12 cents, and increasing the maximum weight from 4 to 11 lbs. It seems to us the rate of 12 cents is oppressive, and might with great propriety be reduced to 8 cents per lb., and probably a flat rate of 5 cents would pay the best of all.

W. K. M.

STUDYING THE MARKET.

I want you to tell us in GLEANINGS something about marketing honey. If I succeed in increasing my bees, as I hope to do, what am I going to do with my honey? Because you old 'vets' know how to do these things, don't soar so high that the beginners are lost from sight.

E. M. BROWN.

Well, perhaps we old writers do lose sight of the beginners to a certain extent in our writings; but I had always considered that GLEANINGS gave a fair share of its space to those who were in the A B C of apiculture. I know that, when referring to the management of the apiary for a crop of honey, the common advice is to study one's field, as well as the bees, so that the field and the bees may be brought together in such a way that the best results can be secured. But I am confident that we should just as thoroughly know our field for marketing, so that our honey and the field may be brought together as effectually for the best results as are the bees and the field.

Producing a crop, without the least idea of what is going to be done with it when produced, is a fault not confined to the bee-keeper alone. The agricultural masses are as often afflicted in this way as are the apiculturists. I should like every reader of GLEANINGS to consider this matter fully, if he has not done so already, for on our ability to market our honey crop successfully turns much of our happiness and success in our apicultural life, to say nothing of the contents of our purse or bank account. Study this matter thoroughly; turn it over and over again, if need be, till this matter of marketing strikes down as deep into your very being as has any thing which has been the most interesting to you about the bees, for on it hangs one of the greatest secrets of successful apiculture. Oh the folly of working from early morn till late at night, day in and day out, only to throw the larger part of it away because the whole mind is bent on a big crop, instead of how much we can secure from the crop after it is obtained! Such a course is only on a par with several of the farmers I used to know when a boy, who would go into the woods in late fall and early winter and pick up all of the fallen wood about their woods, cut it into stove length, and carefully pile it, so as to *save all that was going to waste*, and then leave those piles of wood, many of them, to rot down, rarely using it afterward. I used to ask myself the question, "Would it not have been better to allow the wood to rot without such great expenditure of human energy rotting with it?" Then many would make butter at a great expense of feed, milking

cows, skimming milk, making the cream into butter, and carefully packing the same into tubs and firkins, only to have it stand in some poor cellar or other place, before selling it, till it was nearly spoiled, when the whole had to be sold for a song. Of course, under our present-day state of affairs, with the timber nearly all cut off, and our butter being made almost wholly in creameries, this lack of ability in the farmer has been largely overcome, but scores and scores of our bee-keepers keep right on dumping their honey on the town and city markets for "what it will fetch," with no thought regarding a better market or the great injury they are doing others through their paying no attention to this part of the bee business. Far better, produce only half as much, with only half the cost in expense and labor, while being alert in the selling of the same, thus securing equal results without the wear and tear of producing a big crop.

All of our bee-keeping work should be done with an "eye single" to the turning of the finished product to the best possible advantage to us and ours—not that I ever wanted to receive more for my product than would be honest between man and man, but I do think that we should do all that is possible to keep the price up to a parallel to what we have to buy. An even exchange is said to be no robbery. In those early days of my bee-keeping, butter and honey went hand in hand, and I thought that I was in no way robbing my brother-farmer when I let him have as many pounds of my fancy white-clover and basswood honey as I took of his gilt-edged butter in exchange. But under this present age of "creamery extras" he takes more than *two* pounds of my fancy section honey for one of his butter, because he has a chance to do this on account of our having passed from the days of barter to the dollar system. However, if we turn our eyes to sugar, which, on the "sweet-for-sweet" idea, may be a nearer parallel, we find that our honey has a greater purchasing power than it had forty to sixty years ago. With honey at 25 cents and sugar 12½, we got two pounds of the latter for one of the former; but now, with sugar at 5 cents and section honey at 15, we get three pounds of sugar for one of honey. I have used only these two items to give us something of an idea of what our knowledge should be based upon in calculating the market price where our honey is disposed of in our home market.

Before our crop is produced we should be calculating what we are going to do with it. We want to have some idea of whether we can sell it at home, or whether we shall have to send a part or all of it to a distant city. We want to consider the ability of our neighbors to buy. The most of us are not fortunate enough to have wealthy customers who can buy our honey at any price. Most of our neighbors are, like ourselves, buying the necessities as cheaply as possible, and doing without the luxuries. If wheat and potatoes are cheap, and wages low, those about us who would buy honey will buy sugar if we

do not give them some inducement. Then it is best not to forget that hard times are harder on a large per cent of the city people than on the producer, and hardest of all on wage laborers.

Now, having, to a small extent, studied the situation, let us try to do what is *right* as well as what we can. If the distant cities will not pay us good prices it is better to decide that the poor at home have as good a right to "cheap eating" as those with large capital. The poor man's dollar should buy just as many pounds of honey as the rich man's, and the poor man can have a chance if you tell him in your local paper or by a sign at your gate that your honey can be had at the low price of the city markets, less the cost of freight and commission. Don't try to add these on him; for if you shipped the honey, *you* would have these to pay. I find one of the troubles about marketing our honey at home, right among our own friends and neighbors, is that, like many of our farmers, we will not sell it unless we can get as much for it at our door as it will bring in the distant city market. Let us be reasonable and honest in all our marketing projects, whether others are or not.

YELLOW VS. LEATHER COLORED ITALIANS.

**A Few Words in Favor of Yellow Italians:
Keeping the Brood-nest Clear of Honey to Make Room for Brood.**

BY E. W. ALEXANDER.

For some time many honey-producers have shown a preference for the darker or leather-colored Italians. This would be all right if it were not that they have a tendency to degenerate back to hybrids and blacks when continued a few years. It is the same with bees as with all our domestic stock. We must have a standard to work for, and the color line seems to be very essential in our horses, cattle, swine, and poultry. Now, if we fail to keep up to well-marked Italian bees as a standard, then unprincipled queen-breeders can send us their hybrid mismated queens; and we, not having any fixed standard as to color, will have no chance to complain, as they can say they sent us queens of their dark Italian strain.

I for one have my doubts if any of the dark strains of Italians are superior to our three and four banded bees—that is, taking them as a whole in large apiaries there are occasionally some exceptions in each class; but one thing we must all admit; and that is,

Italian bees are far ahead of our blacks or hybrids in gathering honey; but in order to acquire the best possible results we must give them in some respects especial attention. Their never satisfied desire to gather honey causes them to fill the brood-nest early in the season; but if this honey is frequently removed so as to give the queen a chance to fill and keep filled all the combs below the supers with maturing brood, then you will soon have a large working force, and you are then quite sure to get a nice surplus; but if you neglect to keep this honey out of the brood-nest, then you will have a weak colony and little or no surplus, which will cause you to become prejudiced against all yellow bees.

Next season make it your especial business to see every comb in all your colonies before you put on your supers. See that each one is full of brood from top to bottom and end to end; remember that each square inch of capped honey in those breeding-combs costs you about 30 worker bees every 21 days.

The convenience and time saved in looking up twenty or more queens a day, as we frequently do during the summer season, is quite an item in favor of yellow bees. Some think these bees do not winter as well as the darker ones. I find that, where this is the case, it is caused by the Italian bees crowding the brood-nest with honey in August so as to stop all chance for breeding after Sept. 1; consequently they go into winter quarters rather weak in bees; and those they do have are mostly old and nearly used up. If you will remove two of the heaviest combs about Sept. 1, and put in the center of the hive two good empty breeding-combs the queen will fill them with brood, and your colony will be much stronger and better in the spring.

Still another thing in favor of our yellow bees which is of more importance than all other things combined is the fact that they are almost immune to that destructive disease known as American foul brood. Those of us living in this part of New York, who lost thousands of colonies a few years ago from the effects of that disease, know well how much we owe to those yellow Italian bees; for without them the production of honey in this part of the State would be a thing of the past. Sometimes I think the great loss we sustained was a blessing in disguise, for now we have better bee-keepers, better bees, and are securing far more surplus annually from our Italian bees than we ever procured from the black and hybrid colonies we used to keep.

When dividing or forming nuclei it is frequently quite difficult to keep the darker strains from returning to the old stand; but not so with the golden Italians. I find that, if they have some brood, or a queen of any kind, they will stay wherever we put them. This is a good point, and often saves much trouble; then they will defend their hives from robber bees the best of any I have ever had.

Give these bees the special care they require and you will be surprised at the good surplus you will receive during poor seasons.

Almost any bees will give us some surplus during a good season, but it is the well-bred bees that give a surplus every year. They will find nectar though they may have to go several miles for it.

Now, don't think we have either bees or queens for sale, as we have not. I write the above only according to our experience in keeping bees of all shades of color from the genuine black to the yellowest Italian.

I might cite many more valuable traits that are well developed in those yellow bees, such as having but little desire to swarm, and breeding up fast in the spring. This is very much in their favor, as they keep their brood so compact that comparatively few bees are required to feed and keep it warm. Then it is easily proven that they cover a much larger field in search of nectar than the darker strains. I have often found them a mile or more further from home than the other bees.

With our well-bred Italian bees we now have good stock to work from; so let us unite in trying to improve them along the lines most necessary in developing a superior all-purpose strain of bees. This can be accomplished to a great extent in a short time; then bee-keeping will become more reliable, more profitable, and a much pleasanter occupation. It has been a long hard task to free it from the rut of ignorance and superstition of past ages; but we have at last placed it well forward among the intellectual pursuits of rural life; and now let us be careful and take no step backward that will check its forward progress along with other successful agricultural pursuits.

Delanson, N. Y.

THE STORM-DOOR FOR BEE-HIVES.

Its Origin and Use.

BY A. J. HALTER.

On page 97 you refer to storm-doors as illustrated, patterned after suggestions of Mr. Doolittle. I would say that I used some about two years previous to Mr. Doolittle's suggestions as stated in GLEANINGS in 1906.

Last spring I purchased from Mr. J. P. Noland, the nurseryman at Peninsula, Ohio, his entire outfit of bees and hives, among which was a similar device for the Langstroth hive, made about fifteen years ago. He called my attention to its use in 1902; but as I had only a few colonies I did not consider the value of storm-doors until I realized the heavy loss of bees by having a free entrance, and I made a model as illustrated on p. 321 of our issue for March 1, 1907. For those using a reversible bottom-board placed close to the ground I would suggest cutting a notch in the lower side of the ends so the center will rest flush on the floor-board. However, if so applied be sure to leave several inches in front so as to leave an alighting-board for the benefit of bees that return in a chilled condition.

The theory of storm-doors is not new; but

its value will be more appreciated when once brought into general use.

THE ALLEY TRAP NOT THE PANACEA FOR CATCHING SWARMS.

On page 19 you make reference to Mr. Taylor's system of using a queen-trap in preference to clipping queens to prevent swarms from escaping.

Good results can be obtained by limited use from a great many devices, as also entire systems; yet if applied universally, or relied upon to a great extent, evil results are often the reward. While there are flaws more or less in almost every undertaking, there are certain rules which, if carefully observed, will bring better results in accordance to requirements.

Mr. Taylor does not mention details as to queen-trap usage; and the question arises in my mind, "How can you manage a given number of yards with only one or two visits a week, simply relying on queen-traps?" Suppose all your colonies are equipped with traps. After an absence, say, of five days you come to examine the apiary, is it not necessary to overhaul every trap and let out the drones? and, if you find a laying queen, you undoubtedly feel somewhat gratified; but as you go on further there is a trap containing a virgin. Was it a case of swarming, or have you detained her from her wedding-trip? At any rate you decide to give another trial; further swarming takes place; but before you can make another visit heavy rainstorms and chilly weather intervene and you find traps full of dead drones, perhaps also some dead queens. You will begin to wonder where you are "at."

For a number of years hives with a portico have been deemed unfavorable, being conducive to swarming. Is not a queen-trap a select place for bees to cluster and dream of the happy land which they desire to acquire by swarming?

Yes, bees, when several swarms issue at the same time under the clipped-queen system, will occasionally cluster together when a virgin emerges; and in order to prevent escaping it is necessary to hive them; but this is true in almost every instance when queens are not clipped; viz., "to hive the swarm;" and how disastrous when several swarms with laying queens cluster together, and the victorious queen destroys the others, among which may be some of your choicest queens! The virgin swarms are comparatively small in proportion to laying-queen swarms under the clipped queen system if properly conducted, the age of queens being a marked feature, as also the foretelling of swarming by outside observation.

Queen-traps are very convenient when hunting a queen by shaking bees in front of the hive or catching undesirable drones or minor temporary usages. The modern apiarist, however, is more likely to adopt some system which will give ample protection in his absence, rain or shine, something that will master the situation in outyards as well as carefully guarded apiaries.

Akron, O., Jan. 24.

THE A. I. ROOT CO.'S EXHIBIT AT JAMESTOWN, VA.

SOME HONEY-EXHIBITS.

BY E. R. ROOT.

In the views given we are showing bees-wax and honey-exhibits put up during the past year by The A. I. Root Co. The one above, at the Jamestown exposition, was put up for and in the name of the State of Ohio, and was, in fact, a part of the agricultural exhibit, and by no means an inconspicuous part either. Unfortunately the

light did not allow the exhibit of wax to show up properly. The other exhibits were in the name of The A. I. Root Co. at the Ohio State Fair, Columbus, last September.

Mr. Jesse A. Warren, who has charge of exhibit work, has given the question of bee, honey, and wax displays a great amount of study. He has in mind in every case not only the artistic and the attractive but the educational feature as well. In both exhibits it will be noted that he has carried out these ideas. Besides live bees in observato-

THE A. I. ROOT CO.'S EXHIBIT AT THE OHIO STATE FAIR.

THE A. I. ROOT CO.'S EXHIBIT AT THE OHIO STATE FAIR.

ry hives, he had a large collection of photographs illustrating the various phases of bee culture; and directly under was an explanatory note. Thus it is that a visitor can get a comprehensive view of the business in a very few minutes, even though there be no one present competent to explain. The Ohio bee and honey exhibit at the Jamestown exposition was one of the most interesting displays in the States building.

The queen-bees and the old-fashioned straw skep in wax were first made out of clay by a professional clay-modeler. A plaster cast is then taken, from which wax molds are turned out in any quantity. It is a difficult thing to make a queen-bee so that it will "draw" out of the mold; but we succeeded in doing it perfectly.

HIVES ON ELEVATED STANDS.

BY W. A. PRYAL.

"Hives of high and low degree," as if there could be any such social distinction among the hive fraternity! Yet there are high hives and there are low hives; and there are hives low upon the ground and there are hives high from mother earth.

For a long time we have been impressed that it is well to have all colonies of bees near the ground; that it is easy for the bees, should they fall to the earth, to crawl back to their hive via a short alighting-board. That is well and good; I have most of my hives that way, for it is the cheapest way to have them. But I have had a few perched up a bit and I like the plan very well. The older I get the less I like to stoop over the low-down hives.

In the photo I show one of my hives—it is not my regulation hive; it was one hived in a super, and another super put above as a *super*. But it is the pedestal that I call attention to. It was a receiving berry-chest and forms the bottom-board as well as the alighting-board of the hive. I notice that a bee that has not got its "bearings" well figured out, and drops short of the entrance, will alight against the side of the pedestal, and without loss of time crawl up to its home. It is very seldom that a bee misses getting a foothold upon the pedestal alighting board. I think their chances of doing so are as good as if not better than in falling upon the low-arranged board so much in vogue.

The objection that might be made to a hive so placed is that it would be more likely to

PRYAL'S ELEVATED HIVE-STAND.

THE BRANT DISTRICT BEE-KEEPERS' CONVENTION.

be tipped over than one set closer to the ground. This is true, but when solidly set up there is little likelihood of their being thrown over. When interspersed with a few low-set hives, they make an apiary more picturesque. I have found that all hives I have up on stilts seem to do better than the colonies that are near the ground. But what a pleasure it is to go to one of these hives and stand at the rear and manipulate it without any back-racking tortures!

In connection with the photo I will here state that not only are the hives or supers shown made of our western or Oregon spruce, but also the big box forming the hive foundation. This wood is the worst on the coast to check; even when painted it is not rendered proof against this evil. The hives were painted with two coats of lead and ochre.

The plant growing at the left of the hive-stand is our well-known *alfilerea* or pin-weed, one of the best early honey-plants we have. It is seldom a specimen of this plant is found growing so erect as the one here shown.

Oakland, Cal.

[While it is much more convenient to handle hives elevated from the ground, yet in localities subject to chilly or freezing weather, such elevation causes a large loss of bees, for the reason that many bees coming in partly chilled drop short of the entrance. If such bees can *crawl* into the hive by an easy grade they will be saved. If, in order to get into the hive, they must take wing, this they will not do, because they are too chilled, and consequently are lost.

We are satisfied that there are heavy losses in our northern States in the spring and fall from this cause alone, and any bee-keeper in such States who fails to provide easy runways into the hives, close to the ground, is wasting many dollars. In a climate like that of California there would not be such losses, and in that case convenience should be consulted by having the hives elevated.—
ED.]

BEE-KEEPING IN CANADA.

The Brant District Bee-keepers' Convention; a Discussion on Feeding; Fall Packing for Winter; Thick vs. Thin Syrup; Acid or No Acid.

BY R. F. HOLTERMANN.

At the head of this page is an illustration showing some of those who attended the Brant District Bee-keepers' convention. Its standing is between a county and a Provincial or State convention, and the success of these meetings has been so marked that year by year a larger number are in attendance.

Among those present this year were Mr. L. A. Aspinwall, last year president of the National Bee-keepers' Association, and this year president of the Michigan State Association; Mr. O. L. Hershiser, Buffalo, N. Y.; F. J. Miller, president Ontario Bee-keepers' Association, who is also president of the Middlesex Bee-keepers' Association, London, Ont.; W. A. Chrysler, Chatham, Ont.; D. Anguish, Lambeth; Wm. McEvoy, Wood-

burn; R. H. Smith, St. Thomas; F. A. Gemmill, London; A. Laing, Hamilton, and Mr. Tebbs, manager Boys' Home, Hespeler; Mr. Chris. Edmanson, president Brant Bee-keepers' Association, who occupied the chair during the opening session.

WHY IT PAYS TO USE ALL-SUGAR STORES FOR WINTER.

The subject for discussion was, "Natural or Artificial Stores—which? when supplied and where placed?" Before giving briefly some of the statements made, let me say that, as a result of one or two seasons where great loss has been occasioned, in part, at least, by inferior natural stores for winter, there was an entire unanimity of opinion among the members that it was desirable to give bees sufficient *artificial* (sugar) stores to carry them through the season when, by reason of long-continued cold, they were confined to the hive.

I was taken back to my early bee-keeping days of some twenty-six years ago when a somewhat similar disaster took place followed by discussions upon the wintering problem, the pollen theory, and the advocating of sugar syrup for winter stores for bees.

Captain Hetherington once said that *he did not winter with uniform success until he fed each colony enough sugar-syrup stores to carry them through the winter.* Just here I would endorse the sentiment of the captain. If those in sections far enough north so that the bees are confined to the hive for two, three, or four months, would provide each colony with, say, 15 lbs. of sugar-syrup stores, the entire bee-keeping industry would undergo a change. It would become an industry of greater stability. But what is one man's poison is another's meat. A word to the wise is sufficient.

WHY FEED IN THE FALL.

Mr. F. T. Adams, Brantford, opened the discussion by stating that he remembered well the time when he thought it an extravagance to spend money on feeding colonies sugar syrup in the fall. He depended on spring feeding; and if the weather was not suitable in the spring the bees were not fed, and under such conditions they often perished. He now advocates feeding heavily in the fall so the bees will have plenty of stores until sufficient honey comes in the following spring. He considers *early* spring feeding bad because it breaks the cluster in the hive, excites the bees; and often the brood, which the bees begin to rear, is abandoned before maturity, and destroyed. He likes to feed as early in the autumn as possible, before cold nights interfere; with him this is about Aug. 25. Then the stores are well ripened and capped. If his bees had a fall flow he might feed later. He contracts generally from ten combs to seven; and if any colonies have too much brood to feed properly he takes a portion out and gives it to weaker colonies.

He uses, by measure, two parts of granulated sugar to one part of water, first bringing the water to a boil, then gradually stir-

ring in the sugar, bringing the mixture to a boil.

Members in convention now resolved themselves into a series of hostile camps, being hot and cold "processors," thick and thin syrup-makers, and advocates and non-advocates of tartaric acid. W. A. Chrysler, F. J. Miller, and A. Laing, all good men, advocated the cold process; H. G. Sibbald, J. H. Shaver, D. Anguish, Jas. Armstrong, and L. A. Aspinwall were advocates of the warm process. Mr. Sibbald even declared that he had lost heavily in winter by feeding syrup mixed by the cold process, and twitted some of the opposition upon the losses they had in wintering, which might be obviated by adopting the hot process. Statements in some cases were somewhat modified by saying that, if the syrup were fed early, the cold process might make less difference.

As to the thickness of the syrup, the proportion advocated ran all the way from half and half by measure to three parts of sugar to one of water (Mr. Anguish advocating the latter). The argument in favor of thin syrup was that it was less trouble to make by the cold process, and that the bees would take it up more readily. Those opposed did not see the use of giving the bees so much water; the evaporation of the moisture kept the bees excited; heat had to be generated, which wore out the bees and wasted sugar syrup. Mr. Sibbald stated that, in late feeding, stimulation to brood-rearing should be avoided and the syrup fed rapidly. This causes the bees to store the syrup before the queen gets ready to lay, and the bees quiet down again almost at once.

Mr. Aspinwall thought syrup should have tartaric acid in it. It not only prevents the crystallization, but inverts the cane sugar. This is a process which, owing to rapid storing, is done imperfectly by the bees. Owing to obstacles, he fed his bees in December last, and could have fed them all winter. He uses a top feeder placed directly over the cluster. He then gives the bees a little smoke and raps the hive when the bees arouse sufficiently to find the warm syrup.

Mr. F. A. Gemmell advocated tartaric acid because it never does any harm, and is sometimes beneficial. Mr. Aspinwall stated that there is a gland in the mandibles of the bee, which secretes a fluid, very rank and strong-smelling. This is formic acid, and, under normal honey-gathering, largely inverts the nectar.

Upon the advisability of contracting the brood-chamber for winter there was a fair amount of unanimity. The desirability for bees to cover, as nearly as possible, their stores was admitted by all. It was, however, pointed out that, in case of danger of foul brood, the contraction resulted in a wholesale mixing of the combs, which might result in spreading the disease.

It was advised to feed in the fall as soon as the queen had stopped laying when the brood space in the hive would be contracted so the bees could store the syrup in these emptied cells, and cluster over the stores during win-

ter. Mr. Sibbald made a good point when he said, "Pack bees, that are to be wintered outside, early; fall packing is a greater advantage than spring packing."

In closing this article let me say that, if the stores are not good in the hive during that portion of the spring when the bees are much confined to the hive, it has a very injurious effect. It causes dysentery, weakens the bees, and keeps up spring dwindling. Such stocks had better be given a good rapid feed the first opportunity.

Brantford, Ont., Can.

GHURIB DAS.

BY W. K. MORRISON.

The subject of this sketch is a unique character who deserves more than passing attention. Dressed in the garb of an Indian coolie he looks like a genuine native of India. As a matter of fact, he is a typical son of old Scotland, both in personal appearance

GHURIB DAS, ADJUTANT OF THE SALVATION ARMY IN BRITISH GUIANA.

and behavior, and in no respect need the old land be ashamed of her son, even if he has thrown away his kilts.

Ghurib Das was originally christened by his family minister plain Alexander Alexander. In course of time he obtained a position as overseer on a sugar-plantation in British Guiana. He found it a hard place, not only for a white man, but also for the East Indian black man; and he determined,

after his conversion and reformation, to become a Salvation Army missionary among the natives of India residing in Guiana. He soon found it was difficult to reach them, even when he spoke their language. They criticise missionaries because they have good clothes, eat fine food, and live in nice large houses, so that it is easy to be a Christian. To get nearer their hearts he decided to adopt their garb and imitate them as far as he could. This had the desired effect, and he soon gathered a number up from their degradation, for bad habits, janga, and opium will ruin any man, even if made of "blood and iron."

Besides gathering up Indians he also got together a motley collection of Scotchmen and Englishmen who had been overseers like himself, but who had fallen by the wayside, chiefly because they liked Scotch fire-water better than life itself.

He had made no arrangements for receiving white men, but he did not send them away. On the contrary, he took them home; but even that would not do, so he raised funds and bought a home in the country, where they could sober up and start a new life under new surroundings.

To keep his protégés busy he started various little enterprises, one of which was an apiary of about thirty colonies. He did not know any thing about bee-keeping, but he read up on the subject until he was able to teach the art to others.

It was in this way I came to know Ghurib Das. He wanted to know more about bees, and sent for me to tell him. I found him in his "office," which consisted of a bare table behind a coolie eating house in Georgetown. It seemed to me he was casting up accounts, and it is well known he does not waste a cent. He runs another lunch-room for whites out of work, and also an industrial home and laundry, both for East Indians. He conducts street services, and makes visits to the country around, so that his time is fully taken up for 16 hours a day. How he got time to learn bee-keeping I do not know.

Ghurib Das has the entire confidence of the planters and business men of his country, who contribute readily to his plans as far as their money will do it. Some of them do not believe in ordinary missionaries, but they cordially believe in this one. He was one of the prominent figures in the Salvation Army Congress in London some years ago, and deservedly so, on account of his self-denying character and genius for work.

I have met all sorts of missionaries, lived with them, slept with them, and traveled with them; but Mr. Alexander is the noblest of them all, because he is the humblest.

WE have just received the annual report on food adulteration, issued by the North Carolina Department of Agriculture. The report on honey is interesting. In 1901 the percentage of adulteration was 20; in 1903, 33.3; and in 1906 none at all.

EDWARD FRITZSCHE'S SHED APIARY, RICHMOND, N. Y.

SHED APIARIES.

Good Protection in Summer and in Winter.

BY EDWARD FRITZSCHE.

I am sending you two photos, one of which shows my little daughter Edna, only four years old, holding a frame of bees. The other gives a view of a part of my apiary.

I have used the sheds shown in the larger picture for the last three years, and have not found them very inconvenient; but I do not intend to place the hives so close together again, as it tends to encourage mixing and fighting. The sheds afford good protection in the summer from the sun, and they are the only and the best thing for outdoor wintering, as they are a good protection from storms. As soon as snow comes I close the front of the sheds with doors, and always find the colonies in good condition, with plenty of honey in the spring.

About my little helper, Edna, who is only four years old, I would say that, even if she does get a sting or two once in a while, she is not afraid of them; and even when she was holding the frame she got one sting, but still held the frame till the picture was taken. She also comes and calls whenever the bees are swarming, should I not happen to be in the yard.

Richmond, Staten Island, N. Y.

[We are of the opinion that closing the sheds during bad weather in the fall or spring as well as in the winter may be good practice providing that such closing shuts the hives in darkness. The sheds should, of course, be opened in flying weather. Failure to do so promptly would more than nullify all the good that had been done.—ED.]

MOVING BEES.

Bees Moved more Safely in Winter than in Summer; Some Experience which Shows that December is the Best Month in the Year for Moving.

BY DOUGLAS D. HAMMOND.

During the past 15 years I have been so situated as to move a great many colonies of bees from one to several hundred miles. My first experience was in buying colonies at sales in January and February, and moving them to a cellar. At first I thought this would do them great damage; but to my surprise they invariably came out in good condition. I once moved 98 colonies in a bobsled during January, and I expected to break some combs; but up to date I have never broken a comb, although I have moved bees every month in the winter.

If you start in to close the entrances to quite a number of colonies, by the time the last is closed you will simply be astonished to find how the bees will give off heat. This warms up the combs; and if there is any empty space it is at the bottom of the frame; hence there is no jerk or leverage on the place where the comb is attached to the top-bar. In warm weather, on the other hand, the lower part of the comb is full of brood, and is heavy. Just above the brood the comb is very tender from the time the first pollen comes in in the spring until the first cold nights in the fall. It is just at this point that combs are so often broken when the moving is done in the summer.

Another reason why moving can be so safely done in cold weather is this: Every practical bee-keeper knows that, when the

honey in a hive is all sealed, as is the case in winter, the bees will not load with honey when disturbed. In the winter, from actual experience I find that the bees will rush against the screen at the entrance; and after two or three hours, no matter how much the car or wagon jars them, they will leave the entrance and quietly cluster as though they were undisturbed. After my experience of being in a car three days on one occasion, and two days and two nights on another, and never having a lot of bees do nicer, I honestly think a month would not have done them any harm. All this moving I am referring to was in freezing weather, and I never found more than from a dozen to twenty dead bees when I took off the screen. In winter, the only ventilation necessary is at the screened entrance, which should be $8\frac{1}{2} \times 12$ inches.

I have moved a great many colonies in warm weather in well-screened hives. I have even put empty bodies on top, and covered them with screens, and then found from actual experience that, if water is not given the bees every few hours, they will destroy all unsealed brood the first 24 hours. By the second day all unsealed brood, as a rule, will be gone; even if plenty of water is given, and if the colony was very strong in starting, it would be only a mere nucleus by the time the first honey-flow occurred after the arrival. Under such condition the queen seldom has any ambition. Light colonies stand summer moving much better. They will build up and do finely.

On Nov. 6 I moved 23 light colonies to my new home from Sac Co., Ia., having sold all of my stronger ones, and they have come through in good shape. The distance was a little over 100 miles, and the time in transit was 33 hours. I took them in a car with other stock and household goods.

Now, if I had bees in Iowa, or in any other State, and intended moving at any time up to May, I would move by all means in December, or during a month that would correspond to December in Iowa. When I arrived at the destination I would not be afraid to put the colonies in a cellar. Any

EDNA FRITZSCHE, AGE FOUR YEARS.

bees that I might see would be small and wonderfully active, and at the entrance there would be a fine dry dust which we all accept as good conditions for any colony. My reason for preferring December is that the weather is usually not so severe during that month; otherwise, January or February is just as suitable.

When I moved to Sac City, Ia., five years ago, I moved three two-frame nuclei, five three-frame nuclei, as well as some full colonies, all of which had been in a cellar up to March 1. They were taken out of the cellar, and loaded in the car and shipped about 300 miles without any profit. While on the way the weather was just a little above zero. I never had bees do better.

In a later article I will tell how to load colonies in a car and how to ship bees in less than carload lots. On most of the railroads bees can not be shipped in less than carload lots except by express, unless certain methods are used which must necessarily be in strict accordance with the rules. During the last ten years I have always sent household goods, bees, etc., in emigrant cars.

After reading this, if any one wishes to know how bees behave on the road in winter, let him take a colony in a buggy a few

miles, and then open it and see if any of the bees are full of honey. Any amount of transit does not hurt bees if they do not gorge with honey.

Truro, Ia., Dec. 17.

BEES CLUSTERING OUT ON FRONTS OF HIVES.

Value of Deep Entrances in Summer.

BY DR. C. C. MILLER.

When bees have little to do in the fields toward the close of the season, especially during a hot spell, they are likely to hang out in great clusters, and many an inexperienced bee-keeper has watched in vain at such times for a swarm to issue. With a bottom-board two inches deep the bees are not so likely to cluster outside, but take it out in hanging down below the bottom-bars as shown in the illustration in the hive at the

DEEP ENTRANCES DISCOURAGE CLUSTERING OUT ON THE FRONT OF THE HIVE.

right. That picture is reproduced from a snap-shot taken Sept. 17, 1906, at 3:40 P.M., the thermometer at 89 degrees in the shade, and the blazing sun shining directly into the entrance.

There is something very attractive about the appearance of such a cluster, and I always have a feeling of regret that it must be interfered with by putting any thing in its way during the busy season to prevent the bees building down. Quite possibly the bees have the same feeling of regret, for they apparently take pleasure in sailing straight into the hive and alighting directly on the cluster, instead of alighting on the floor and then climbing up. It's a pretty sight to see the bees take this short-cut to their home.

Do you see that apple lying in the grass right in front of the hive at the right? That suggests one trouble in having hives under the shade of apple-trees, in spite of the fact

that an apple-tree forms a splendid shelter for man and bee. In a still night in the fall you'll hear "whack, whack," as one after another the apples fall on the tin or zinc roofs. Perhaps, however, the bees get used to it.

Marengo, Ill.

SPLIT SECTIONS.

Foundation Cut to Fit; Objections to Bottom Starters; a Plea for Full Sheets Fastened to Top and Sides of Sections.

BY ALLEN LATHAM.

This subject is of especial interest to me, as I am about to choose between these two methods of preparing the sections for the honey-flow.

I was at first greatly pleased with the split-section idea, not only because of the apparent saving in labor, but because of the evident gain in perfection of completed section. But the thought of the edge of foundation showing on the top and sides of the section has kept coming into my mind with such an annoying persistence that I have had to heed it. No, I can not confidently adopt that plan.

And now on page 82 comes Dr. Miller with the modest suggestion that the bottom starter is a better plan than either the split section or the sheet cut to fit. With his suggestion he points out the frailties of the sheet cut to fit. But are these frailties such that they can not be overcome? Surely it seems not difficult to arrange a contrivance with which one can square his sections at the same time that he puts in the snugly fitting sheet. As to the melted wax at the sides, I would suggest that, with expert work, the amount of wax can be brought down to such an insignificant quantity that the objection is not serious. Moreover, in cutting the comb from the section it is improbable that one person in a hundred cuts close to the wood. The edges of the cell-walls as naturally built by the bees will offer fully as much obstruction to the knife as will the melted-wax line. The only comb easy to cut out is that which has no cells of honey next the wood; and, except for appearances, any user of honey would prefer such a comb to one of those fancy no-peep-hole sections.

Yet it is desirable to get the plump section, for the simple reason that it will sell better—sell better because the buyer thinks he is getting more honey for his money.

Any one of the three methods under discussion will produce the plump section, and any plump section is difficult to cut the comb from.

Permit me now to discuss the "better than either," the bottom starter. Firstly, is the bottom starter necessary? I feel constrained to say that it is not. If one will nip the heads of those queens whose workers fail to build comb quite to the bottom of the section, and breed only from those queens whose workers build the comb down and fasten it firmly to the bottom, he will need to use no bottom starter. I am inclined to the belief that my good friend the doctor has bees which are disinclined to build comb to the bottom. A few years ago I was awarded a premium queen which was reared by Dr. Miller. She was a vigorous queen of good size, and proved prolific. Her workers were energetic, and had honey-gathering qualities which were not to be despised. But such combs as they did build! I never saw bees any worse in this particular. They would build a frame of comb and not fasten it anywhere except to the top-bar, while their sections of honey were solid chunks of honey with daylight showing all around the chunk except at the top. It is needless to say that I quickly got rid of that queen. Now, one queen does not denote the character of the bees in one's entire apiary; and, more than that, we all occasionally find a queen of our own rearing which will show this comb-building trait. Still, Dr. Miller tells us that he has to use bottom starters.

I have produced hundreds of sections without bottom starters, which had the comb almost as solidly built to the bottom as to the top of the section. Occasionally I spot a colony nearly all of whose product consists of sections which will let you slide a match along the bottom-bar without brushing the plump comb above. That colony is marked for requeening.

Secondly, is it desirable to use even bottom starters? My experience with these is much less than that of Dr. Miller's. Only two seasons have I tried bottom starters. I tried them in the hope that I could produce my honey thus without separators. And they did help. I have no question that I get a larger percentage of cratable sections (unseparated) by the use of bottom starters than I do without such starters. I can not here enter into the reason why I prefer to go without separators; but having that preference I wish that plan of using foundation which will bring the best results.

With separators one can use almost any plan of foundation fastening, starter or full sheet. He will get almost as good final results whatever the plan, though even with separators there is a choice as I will point out in a moment.

The bottom starter calls for more putting work. Just so far is it undesirable. It makes each section of honey cost more.

The bottom starter with me spoils many a section. Right here I see the doctor's jaw drop in astonishment. Possibly I do not

know how to use the bottom starter; but I have tried faithfully to follow the very best advice and directions, those of Dr. Miller. I cut my foundation carefully, use a bottom starter not over half an inch wide, usually less. The space left between the starters is about $\frac{3}{16}$ inch, sometimes as small as $\frac{1}{8}$, and sometimes as large as $\frac{1}{4}$. What results? I have removed a case thus prepared, which, from above, seemed to contain 28 sections, every one nearly perfect. Upon drawing out the sections three-fourths of them show bad joints between the starters. Right at that point the comb at its best will be irregular, with cells of different size and of different shape from the normal. When not at the best there will be frequent unsealed cells, and, not infrequently, empty cells of grotesque shape.

Looking into the why of this I discover that the cause can be one of several. The narrow bottom starter keeps a pretty well-fixed position, but not so the upper sheet. This gets out of true before the joint is made. One cause of the disjuncture is failure to see that the foundation does not strike the side of the section when it is squared up. If, when squared in the super, the side of the section pushes against the sheet of foundation, it will throw the further (lower) corner to one side. Again, bees frequently cluster in the super between the foundation sheets of adjoining sections, and start to draw out that foundation several hours before a cluster of bees get at work upon the other sides of these two sheets. The side first drawn becomes convex and the unstarted side concave. The drawing-out so strengthens the sheet that it never becomes straightened by the drawing-out of the other side. In this way the lower corners, and sometimes the entire lower edge of the sheet of foundation, are thrown out of line with the bottom starter. Again, one lateral edge of the sheet is early fastened to the wood while the other still hangs free; then the earlier or more rapid building of one side throws the lower free corner to one side. Again, I am inclined to the belief that some foundation warps. Such warping will throw the upper sheet out of line with the bottom starter.

Such throwing-out of line is disastrous. The work at the juncture is delayed. The perfect comb above and below is filled and sealed, while still unripe nectar is in the irregular cells between. This delays the removal of the super; and, if the season is cut short, prevents the completion of that super.

If the weather is hot the upper sheet tends to stretch. If it stretches too much it will frequently pass the starter, and the result is again bad. If it has already been fastened to the starter before the full stretching occurs, a bad bend in the comb occurs. The cells on one side will flare out while those on the other side will run to an end before they become full depth. I have seen such cells filled with honey and no true capping on them, the side-walls joining in a point. I have even seen them dry and empty, air-

spaces entirely surrounded with honey, or, rather, cells of honey.

I use the extra-thin foundation. With the thin it is possible that my experience with the bottom starter might be more satisfactory. But I must use the extra-thin, for I will not have gummy septa in my section honey.

Even with separators the sheet of foundation with free lateral edges often brings poor results. The sheet takes on a twist, and the cells on one side and one edge will be shallow, while backing up to them are cells of double depth. This means slow finishing in that super.

With all these facts in mind I am feeling the need, more and more, of sheets fastened to the sides of the section. I have for over a score of years allowed my foundation to hang free, and have had no experience whatsoever with the firmly fastened sheet. All logic points to success through such fastening, and the coming season will see the plan largely tried in my apiary.

Only one possible fault, aside from the extra work, occurs to me. If the foundation stretches, will there not be irregular cells brought about by the sides? Let a man put his hands into his trousers-pockets and lift. The appearance which those trousers will assume suggests the wrinkle-sided result that might follow the use of full sheets of foundation fastened at the sides.

It will be obvious, from what can be read between the lines, that I have no use for a full sheet fastened at the bottom. I would leave a scant quarter of an inch there for the possible sag of hot weather.

Finally, after all is said, the very best section honey of all can be produced with only a wee small starter at the top.

Norwich, Conn., Jan. 20.

PAPER WINTER CASES.

Some Interesting Experiments Going to Show that their Use is, after All, False Economy.

BY J. L. BYER.

Considerable prominence has been given in GLEANINGS in reference to what I said regarding paper winter cases in the November issue of the *American Bee Journal*. As the editors of this journal have given prominence to the paper idea, it is only proper that I give my reasons for reaching such positive conclusions as quoted by Dr. Miller on page 1554 of GLEANINGS, 1907. Bare statements without any thing to substantiate them are of little value, and apt to impress the readers with the idea that prejudice may have some bearing upon the case at issue.

In the spring of 1903, 20 colonies of bees were bought and put in the home apiary of 110 colonies, making a total of 130, which, by natural increase, came up to 160 when the bees were gotten ready for winter. As the yard was very much crowded, the 20 colonies were placed here and there all over the api-

ary, wherever room could be made; so, as a natural sequence, they were *protected* more or less by the position they occupied between large packed hives on each side of them.

The hives were eight-frame, L. length, but exactly one-half deeper than the standard Langstroth—a hive, by the way, with a good many admitted disadvantages, yet withal a splendid one for outdoor wintering. All the rest of the colonies were in hives of the same dimensions, only the majority of them were of the ten and twelve frame size. All were permanently packed with paper on the outside of the inner case, and four inches of sawdust between this and outer cases. The outer cases projected six inches higher than inner, making space for a cushion of dry sawdust over the frames.

In the fall, having no suitable cellar, the problem confronted us as to what to do with those twenty single-walled hives. Owing to the crowded condition of the yard, tenement cases were out of the question, and I disliked the idea of making a single case for each individual hive. Just at this time I read about the tarred-paper plan, and at once the problem of wintering those twenty colonies was solved(?). An empty super, the same depth as the hive-body, was placed over each colony, with about ten inches of dry chaff packed snugly on top of the quilt over the frames. The tarred paper was then wrapped neatly around the full size of the hive, super and all, and tacked securely with cleats. As suggested, the paper was allowed to go below the bottom of the hives, a portion of the paper then being cut out for the entrance.

Perhaps the readers will be more assured of a good job having been done when I say that Mrs. Byer helped to do the "papering," as I have often noticed, when any work that requires neatness and precision is to be done, it is much better if there is a "woman in the case."

Now as to results: As will be remembered, the winter of 1903 was a very severe one; in fact, January and February were almost record-breakers. To be brief, the 140 colonies in the packed hives wintered well—so well that we were surprised, as we expected to lose very heavily after the bees passed through such a severe winter. About ten per cent would cover the winter loss in addition to eight or nine colonies that died in the spring from queenlessness and other causes.

As to the twenty colonies in the "papered" hives, by Feb. 1 I saw it was all up with them—six or seven being dead at that early date. The frost formed in coats on the inside of the hives; and whenever the weather became a little mild, the moisture would run in streams out of the entrances.

As to the size of the entrances, I forgot to say that some were left 5 inches by $\frac{1}{4}$, and the rest much smaller. However, it became imperative to enlarge the small entrances, as this moisture referred to congealed to such an extent as to close completely the entrances

when the weather turned colder. Out of the lot, only three survived, and they were reduced to mere nuclei.

You may say this was an extreme case, and not likely to be repeated for some time. Admitted that such is the case, *yet one experience like this would pay for the extra cost of winter cases for years to come.* I admit that, even in our latitude, *some seasons*, bees will winter fairly well in hives protected by paper if some dry packing is placed on top of the brood-nest; but that is no argument in their favor, as the bees will in the same seasons winter in single-walled hives without the paper. It is a well-known fact that strong colonies will often winter fairly well under abnormal conditions; but rest assured that, under such conditions, an *abnormal* amount of stores is always consumed.

For eight consecutive years one of these big twelve-frame hives referred to, with only the single walls, wintered well with no protection save a super full of chaff on top of the hive. About two inches from the top of the brood-nest a loose knot about an inch in diameter had fallen out, and it was possible at any time during the winter to see the cluster of bees through this knot-hole. No doubt Mr. Holtermann and others will remember this incident, as the hive was shown them during a bee-keepers' meeting at my father's place. With all this exposure they wintered well enough to average over 100 pounds of extracted honey per year for the eight years; but every winter fully a third more honey was consumed than in colonies protected properly. Just so with the papered hives. I feel convinced that, in every case, the saving in packing-material will be more than balanced by increased consumption of stores.

You say, Mr. Editor, p. 1554, that you can see no difference theoretically between paper and other packing-material, and so far as your top protection described on page 93 is concerned I agree with you; but when side and end protection is considered, the paper is no comparison to a few inches of sawdust for resisting frost.

While on the farm we had a large cellar that would hold 4000 bushels of roots, built as an annex to the stock-barn. While the walls of this cellar were mostly underground, over the top was simply a floor of unmatched lumber with roof over all. Now, although the thermometer sometimes drops to 20 below zero, we found that six inches of sawdust over this floor would keep out the frost. Do you think that tarred paper spread over the floor would have given like results?

As the most of my bees are wintered outdoors, I have tried only the paper for spring protection in a limited way; but what experience I have had, coupled with what I have observed in other yards, has disgusted me with its use, as the black paper attracts the heat of the sun *too much*, and bees are enticed out in unsuitable weather. With boards leaned up against the front of hives this difficulty is overcome somewhat; but at out-yards they can not be used. Certainly for

my own use I should much prefer some top protection that will fit *snugly* over the frames to any amount of paper tied around the sides and ends of hives.

This article is already too long, so I must forbear giving the experiences of some other bee-keepers with the paper protection; but before closing I wish to say that, in my opinion, too much stress has been laid by some writers on the danger of *too much* packing for outdoor wintering. Last winter the losses were very heavy in the majority of apiaries, regardless of how bees were packed; but I wish to say that the very strongest half-dozen of colonies to come under my notice last spring, among hundreds of colonies examined, were those wintered by a friend of mine, a farmer bee-keeper. These bees were packed in large cases, four inches of sawdust under the hives, six inches all around, and twelve inches over the brood-nest. The conditions those bees were in on the first of May, after being wintered in those "refrigerators," would have delighted the heart of A. C. Miller in spite of his opinion of such methods.

The argument is often advanced, that the packed hives do not warm up enough to let the bees have a flight, as is the case with the paper-protected hives. True; but the bees in well-protected hives do not *need* the flight in the majority of cases. No, I do not advocate as much packing as the amount referred to in my friend's case; but I do think there is danger of giving *too little* rather than too much protection to bees wintering outdoors in Ontario.

Mt. Joy, Ont.

[There is not much if any difference between your position on paper winter cases and that of the editor. Instead of saying that we "can see no difference theoretically between paper and other packing material," as quoted by you, we said (see p. 1554, Dec. 15), "There should be several folds of newspaper or other packing-material under the paper cap to give the hive necessary protection. We can see no reason theoretically why such a packing-material, protected from the weather by an oiled or tarred paper, should not give just as good results as the same packing-material surrounded by a wooden case." Notice that that statement does *not* compare "paper or other packing-material," but a paper or wooden winter case over the same amount of packing; notice also that we said "packing-material surrounded by a wooden case," meaning not packing-material confined to the top only, as you seem to infer, but at the top and *around* the hive, sides and ends. In other words, if a certain thickness of packing were sufficient under a wooden case, it ought to be nearly if not quite as efficient as under one of paper. Or, to put it still another way, it is not a question of *covering*, but it is a question of the *amount* of packing-material around top and sides, and the quality of it, no matter how covered, if kept dry. But right here is a question: Is it practicable to put as thick a packing under a paper cap as in a double-

walled hive? We think not, for it is very difficult to make packing around the hive, as we'll as on top, hold its place while the paper cap is being folded around.

We shall have to conclude, for a climate as severe as that of Canada, in view of your experience and that of others whom you do not mention, that a paper cap is not satisfactory; that nothing less than a good double-walled hive with plenty of packing between the walls and a powerful colony is suitable for wintering outdoors. Mr. E. D. Townsend (although not an advocate of paper protection for wintering) has used paper successfully for *spring protection* for a number of years. He has found, however, that the black color of tarred paper is detrimental, and so he advises the use of light-colored paper. An article from him on this subject will appear in our next issue.—ED.]

MASSACHUSETTS SOCIETY OF BEE-KEEPERS.

The fourth meeting of the Massachusetts Society of Bee-keepers was held February 1, 1908, in the Ford Building, Boston. The topic for the evening was "Spring Management of Bees," by Mr. Allen Latham, president of the Connecticut society. His long experience had convinced him that, if fall management had been of the proper kind, there would be no need of spring management; and he expressed disapproval of opening up the hives and exposing the bees to cold before May or June. He gave several directions by means of which we could tell by outside observations if the colonies were in good condition or not. Only those that were not in good condition should be manipulated. He was plied with questions, all of which he easily answered. Last he gave a description of his large twenty-frame hives—those that he has at the Cape, which can be examined by him only in June and September, and from which he takes honey in the large frames instead of sections. After a most profitable meeting we adjourned to meet again on the afternoon of the first Saturday in March at 2 o'clock at the Ford Building; and we hope the weather will be pleasant so that all old members can attend. Considering it was such a stormy day and evening it was the best-attended meeting we have had. Nearly 40 were present, and quite a number of bee-keepers joined our society. Others promised to do so at the March meeting. As these meetings are fast drawing to a close we hope to see a good number of the old members who find it inconvenient to attend the evening meetings.

Belmont, Mass.

X. A. REED.

STARTING WITH THREE-FRAME NUCLEI; A GOOD RECORD.

I wish to report my experience with bees in this new country, the Shoshone Reservation, which was opened last spring, 1907. On May 20, 1908, I sent for 35 three-frame nuclei with untested queen. The bees were five days on the road, even though they came by express. When they came I put each nucleus in a ten-frame Simplicity hive and put in seven frames with just $\frac{3}{4}$ -inch starters, expecting the bees to fill the hive or about that. I was not prepared for what followed, for in a short time the hives were full to overflowing. I put on another ten-frame body, and this they filled. I then put on the third ten-frame body, and this they also filled. At this time there was a prospect of three weeks of good honey-flow ahead, and I had no more hives nor sections. Every thing was full; so when fall came I found I had, from these 35 nuclei, 71 stands of bees in ten-frame hives and 600 lbs. of the finest honey I ever ate. I also took 20 colonies on shares and got 800 lbs. of fine comb honey which I sold with the 600 at 12 $\frac{1}{2}$ cts. just to my neighbors, and did not solicit for the sale of one pound of it. It was all sold. Three weeks after, the bees stopped working. Orders kept coming in as far as 60 miles, long after I had sold out.

Hudson, Wyo.

GEO. BURCH.

BEE-SHEDS FOR WINTER; THEIR ADVANTAGE IN PREVENTING THE FLIGHT OF BEES ON UNFAVORABLE DAYS.

I can agree with the editor, p. 96, Jan. 1st issue, in thinking that a great many bees are enticed out when it is too cold for them to fly, and therefore perish. I always let down the doors to the bee-sheds in cold weather, shutting out the light as well as the weather. I let the light in only when the bees should fly.

I must, however, differ from friend Latham that it is necessary to have the entrance directly in front of the cluster. For many years I have left a $\frac{3}{4}$ x 2-inch entrance at each side of the front of the hive. If the cluster is on the east side of the hive the east entrance is found many times completely stopped up with dead bees and ice, while the west entrance is clear. I would not think for one minute of having the entrance in the middle, and depending on that for air, and I have wintered from 30 to 50 colonies for 20 years and never lost one in the winter.

I should think Halter's storm-door very nice for outdoor colonies. Still, bee-sheds are far ahead, I think, if rightly managed. There can be no spring dwindling in them if bees are not enticed out as the editor says. I have never had any spring dwindling of colonies in sheds, but have had colonies badly affected when wintered outside.

Marceline, Mo.

IRVING LONG.

[Your scheme of having a door or lid to your shed that can be let down in unfavorable or bad weather, shutting in the bees and closing out daylight from the entrances, is a good one. Your report on how it keeps

down spring dwindling is interesting as well as valuable. By the way, the time is coming when we shall give more attention to this matter of spring dwindling and losses from flight on bad days in the fall. To winter bees successfully is one thing; to "spring" them is quite another.—ED.]

HOW TO USE THE SIMPLICITY AS A BOTTOM FEEDER.

Here is a new arrangement for bottom feeding with the Simplicity feeder. Cut out each end so that it will be about $\frac{1}{4}$ inch thick; then nail a strip on the side rails of the bottom-board, for a rest, and to permit the feeder to slide in and out. Cut a proper-sized hole in the bottom over the feeder, and slip a piece of tin over this when not in use.

Attaching Simplicity feeder under the bottom-board at the back of the hive.

This feeder will be easy to slide in and out; does not mar the beauty of the hive, nor require any side room. If they were made full width of the inside rails of the bottom, in length, the bottom rails could be grooved to receive them, or the little strips could be quickly put on. I dislike to mar the looks of a hive by shoving the bottom out in front, and believe this arrangement is equally satisfactory, although cheaper.

Bladen, Ohio.

C. H. CARGO.

[This method of applying something already in use we consider to be excellent. If one does not have Simplicity feeders he may use a pan with a float. The rim of the pan could be made to slide into rabbeted cleats the same as here shown.—ED.]

PLURAL QUEENS; A FLIGHT-HOLE FOR EACH QUEEN.

On p. 1579 Mr. Alexander wishes to know why I leave only one super open about the time the young queens are old enough to take their flight. By going back to page 476, for 1905 GLEANINGS it will be seen that I was superseding my queens in the spring. It was just at this time that I hit upon the dual-queen system by having the young queens mated from the super.

I experimented with flight-holes in different parts of the super, but I found that on several occasions it did not prevent the young

queens from going in at the main entrance of the hive; so now I always protect the entrance or flight-hole with a piece of excluder zinc.

As to that expression of being able to keep as many queens as there are supers, I will state that the limit was three queens to as many shallow supers. You must take into consideration that I am in a semi-tropical climate. The queens are introduced in the fall; and, when found to be accepted, the hive is not interfered with before the first week in February, when the top super with most of the honey is placed below.

The sting-cut virgin queen (p 1579) turned out to be a drone-layer, and my second attempt to get several sting-cut virgin queens mated from one hive was a failure.

Sierra Madre, Cal.

H. DAVENES.

CAN FOUNDATION TRANSMIT FOUL BROOD?

There seem to be quite a number of colonies affected with foul brood all through the section between Worcester and Springfield, and possibly in other sections; and all the people here carry the impression the bees in old box hives are free from disease, while those that are in modern hives on frames of foundation are all infected, and that the infection was from the foundation used.

Mass.

SUBSCRIBER.

[We desire to say most emphatically that foul brood is not carried in foundation. Wax from foul-broody yards has been melted up hundreds (and we may say thousands) of times, and made over into foundation without any trouble afterward from disease. There is probably not one pound of foul-broody wax to the hundred that ever gets into the market. Once melting would be sufficient to kill all germs of disease; but after it goes to the foundation-maker it goes through several separate and distinct processes of meltings and refinings covering a period of probably three or four hours all told, during which all germs of disease of any sort would be cooked and killed. It is a principle in bacteriology that boiling for half an hour, then letting it stand for a day or two, and then boiling again, and then boiling once more after another period of rest, will be much more effective than one continuous boiling for the same period. After the wax is melted and cooled, the coverings of the germs open, so to speak, and during this time the germs are very susceptible to the action of heat; and when it is applied again they are immediately killed. Ask any scientific man or any bacteriologist and he will tell you that foundation made by any of the standard factories would be perfectly immune to any disease.

The fact that colonies in box hives in the case cited are free from disease can be explained on the ground that in such hives it is not possible to move combs from one hive to another, as it is in the case of the modern hive with movable frames. If disease of any kind is present in the vicinity it may be transmitted from one hive to another by moving

the combs from one hive to the other for the purpose of equalizing the strength of the colony, supplying stores, or the giving of brood for queen-rearing. On the other hand, it is generally considered that bees in box hives, when they once get the disease, are a much more fruitful source of infection than those in modern hives. In some States the foul-brood laws make it a misdemeanor to allow any bees to exist in box hives, and the inspectors are therefore given authority to order all owners of such hives to transfer the bees out of them into modern hives where he can easily look the combs over and see whether the disease may or may not be present.—ED.]

OUR HOMES

by A. I. ROOT

And the Lord God formed man of the dust of the ground, and breathed into his nostrils the breath of life; and man became a living soul.—GEN. 2:7.

I have just made another great discovery. To be honest, however, it isn't *exactly* a "discovery," because it isn't *new*; and it isn't *my* discovery exactly, either; notwithstanding, it is going to be of wonderful benefit to all mankind. It is about chickens and folks and fresh air—not only *fresh pure* air, but *cool* fresh air, or cold fresh air, perhaps.

While we grant that "folks and chickens" often suffer from exposure to cold, or from "getting chilled," as we term it, my discovery is that the right and proper way to warm up a *chilled* animal is not to take him (or it) into a warmed-up apartment, where he must from the very nature of things breathe the same air over and over again. When winter comes we all get to work to shut out the cold by closing all doors and windows, and even making all the cracks and crevices as nearly air-tight as we can. The high-priced and fashionable hotels up north have storm-doors and double-sash windows, so as to save the fuel-bill; and if anybody objects to the ventilation he is pronounced a crank.

The old-fashioned fireplaces, and lately even the stoves, are crowded out to give place to radiators warmed by steam or hot water, or hot-air furnaces. No wonder the doctors are "kept busy." Some of them are kept *pretty* busy in hunting up names for the new maladies, like grip, appendicitis, etc.

Well, for some time I have been wondering why God has recently put it into my heart to have such a wonderful love for studying all about chickens, especially "baby" chickens. My sister, Mrs. Gray, who has from the first been a leader in the W. C. T. U. movement, said last winter she almost lost patience with me because I used my privilege of talking to great masses of people all over the world in talking so much

about *chickens*—common every-day *chickens* that everybody knows all about, or very much about. When I got to the chapter about "Fighting Mothers," however, she owned up I had made a big moral.*

Well, as soon as I reached this land of perpetual summer once more, the fever for chickens came back, and I have made two hatches with my two small incubators. I have told you about the first and the 70 chickens I gave to my one hen, the original "fighting mother." This hen had commenced to sit in a barrel laid on its side, and this barrel enabled the 70 to mass themselves around her and over her back in a way to economize heat to very good advantage. When night came, Mrs. Root and I were out in front of the barrel with a good light to see how she was going to manage with her remarkable brood, and this is what we saw. Dainty little heads with the cutest bright eyes were sticking out between her feathers all over her body, as it seemed. First they wanted animal heat for their little bodies, and next they wanted good pure *cool* air for their little lungs. A little later (when a day or two older) they spread themselves out in front of and all around her in a way that was a sight to see; and when a cold night came I discovered that they slowly changed places, very much the same way that a cluster of bees does in winter time. The fresh air they must have, as well as warmth. As skunks and other prowlers were about, a wide board was set up in front of the barrel nights; but I soon found this was too close, so I replaced the board with poultry netting, and this did for a while; but in a few days more the 70 were clear up against the netting, and the hot and bad-smelling air admonished me the barrel must be changed for more airy quarters. A little house 4x4 feet with inch-mesh netting on two sides now keeps out the "varmints" and gives the chicks air when they are nearly five weeks old; but the most of them prefer little perches a few inches above the ground. They were weaned when a little over three weeks old, and their fighting mother very soon commenced to lay again.

These 70 chicks and the mother hen have explained to me, as clearly as words can tell, that, while these little bodies must be kept warm, the little heads need to be kept out in the cool air. Of course, chickens will live (some of them) if kept in a warm room where they must breathe warm air, and breathe the same air over and over again, and in the same way people *may* live to a good old age (*some of them*) where they sleep in rooms with the doors and windows shut, breathing the same air *over and over again*; but nature

* A few days ago it was my privilege to listen to an open-air talk here in Bradentown by Mrs. Carrie Nation, and she had quite a chapter in her address on "Fighting Mothers." Although she had never heard of me or my chicken stories, you would almost think that she had borrowed from me or I from her talk. Well, well! This only illustrates once more how "great minds (ahem!) run in parallel channels." Perhaps I should add that, even if she did make lots of people mad, especially the cigaret and tobacco users, the great crowd gave her quite a generous collection.

is, and has been for some time back, making vehement protests. But we are not done with the chickens yet.

Perhaps I told you I gave the 70 to that one hen because a brooder that was on the way had not yet got around. Mr Calvert informed me some time in December that a man named Root, of Cleveland, O., had a new invention in the way of brooders, and that we (The A. I. Root Co.) were going to make some for him. This man (no relation to us), when he knew I was studying chickens, expressed a wish to have me try his brooder here in Florida. I consented, for, in fact, I had his circular over a year ago, and had listened to his reasoning; but I want you all to know that I have paid for my brooder, for the very reason that I want to give an unbiased opinion.

Well, this man Root talks this way: He says a hen's body, after her eggs are hatched, is up to a fever heat of about 107, and that the chicks, after they are out of the eggs (that she has kept close to 103) are warmed by coming in close contact with her legs, wings, and body, where she has pulled the feathers off in order to permit this *close contact*. If you watch you can see the new chicks push and crowd up between her legs, wings, and body, to get this warmth; and then they push out their heads and drink in the cool fresh air, which is really the "breath of life" and the breath that gives life to all animated creation. This air must be pure, and it has been abundantly proven that a sitting hen must not be kept in a warm room, neither before nor after the hatch. It isn't the *heat* that debilitates and kills (for my "fighting mother" hatched 20 chickens and raised them all during one of the hot months here in Florida), providing she is right out in the free air all the time. I am just learning that incubator cellars must be well ventilated, for chickens must have pure air to breathe while inside the shell as well as outside.

Now, this man Root has made a brooder of tubes filled with hot water; and the chicks, when cold, push between and below these tubes and get warm while their heads are out in cool pure air. There is no cloth nor curtains about the machine, and there are so many large ventilators I was at first afraid to keep them open according to directions. My 80 chicks, put into it about ten days ago, are to me wonders of health and vigor. I have just now stopped my writing because of a sudden dash of rain; but, although some of them got pretty wet before they ran into the brooder, the hot pipes soon fixed them all right. No thermometer is sent with the brooder. The directions say none is needed. Just turn up the lamp so the chicks are quiet and satisfied, and that is all. If you get them too warm they just squat down under the pipes without touching them, or move out into the cooler apartment. Several times I have had the pipes so hot I could not bear my hand on them; but the chicks were never harmed at all (they just moved back as you would from a hot stove).

When chickens and folks are suffering from cold there are three ways of getting warm; viz., more clothing (or blankets); exercise, and artificial heat. The latter may do very well if taken from a fireplace or grate; but if we depend upon warming up a room by warming *the entire volume of air* in the room it needs a good constitution to stand it very long. If the room is quite large according to the number of people it may do very well; and a small room full of people *may be* well ventilated; but I fear it is not often done.

The poultry books and journals have much to say of the losses of chickens when two to three weeks old from something they call "bowel trouble." I have never had any experience with trouble of this kind with *chickens*; but, oh dear me! I have had some personal experience along this line, and I will be frank enough to tell you that nothing upsets my digestion like being obliged to remain in a crowded audience where a hundred people, more or less, are breathing every inch of air *over and over again*. Sometimes even churches are poorly ventilated; but this never *need* happen here in Florida, and never should happen *anywhere*. For God's sake (and for the sake of saving souls) do not give the enemy any reasonable chance to discourage church-going by complaining that the ventilation is bad.

Mr. Root, with his brooder, has planned so as to keep the chickens warm while their heads are practically outdoors; and this new book on tuberculosis gives pictures of bedrooms for consumptives, so arranged that, while the patient is sleeping in a comparatively warm room, his head, or perhaps I should say his mouth, is practically out of doors. There are other pictures of sanitariums where sick people are so well bundled up that they almost live outdoors even in freezing weather.

Now, then, when you are chilly, and feel you may "catch cold" if not warmed up quickly, try first, if possible, exercise.* Start out pretty well clothed, and then lay off the extra clothing when you find you can spare it. If both clothing and exercise are out of the question, use artificial heat, but don't breathe the hot air if you can help it, and *don't* breathe the same air over and over. A relative near death was recently made very much more comfortable by being placed near an open fire, with an arrangement to give him cool air right from outdoors to breathe.

Chickens by preference roost in the tree-tops. It would be hard to imagine a situation where they could be more sure to avoid breathing the same air again; and I have heard of lodging consumptive patients in tree-tops in order that they might have the very *best* air. An upper room, I believe, has been pronounced preferable; but an upper

*My chicks when ten days old run out in the rain with impunity, but they run like deers, using both wings as well as legs, and then dry off between the hot pipes with cool pure air all around them. These same chicks ran all over a large dooryard when less than a week old.

veranda or porch, with rubber curtains to keep off storms, is still better.

When your feet are too cold to go to sleep at once, don't go to bed in a warm room on that account, but warm them up with a soap-stone, rubber bag of hot water, or the time-honored flation wrapped in a woolen cloth. The cool pure air will soon give you animal heat enough, and then be sure to get the hot things out of the way or they will make your feet sore and tender.

In regard to brooders here in South Florida, I suppose I should say this is my first experience with brooders of any kind except some very rude home-made ones; and, for aught I know, there may be others having the good features of this one. With favorable weather no brooder of any sort is very much needed after the chicks are a week or ten days old.

The entire poultry business has recently been almost revolutionized by the discovery that cloth curtains are ever so much better than tight glass windows, no matter how cold the weather is; and, just of late, stables for horses and cattle are found to be very much better than tight structures with glass windows. If you are ready and willing to take "the breath of life" as a free gift from God's own hand, look out that you do not, sleeping or waking, stay very long where you are obliged to breathe the same air *over and over again*.

In answer to many kind inquiries in regard to the sister threatened with the "great white plague," I am glad to tell you that our efforts, through a kind Providence, seem to have, at least for a time, warded off the destroyer. Here is what she has just written me:

Dear Brother:—We are now in the worst storm we have had this winter. This is the first day I have been unable to go over to see the folks across the way. I ventured over yesterday, but tumbled into a snowbank before I got home. I am feeling quite well, and very happy to think I perhaps can stay right here all winter.

SARAH.

Manistee, Mich., Feb. 1.

CRIMSON CLOVER IN TENNESSEE.

We clip the following from the *Ohio Farmer* for Feb. 1:

We have experimented considerably in the last two years with crimson clover, and find from our experiments that this forage-plant bids fair to prove most valuable to us. Its hardness and ability to attain a good growth during the winter and early spring make it very valuable to us as a green-manuring crop, as well as a winter and spring pasture. One point in its favor is the cheapness of seed. We bought seed only for an experimental test. We now clip the heads and save our own seed at very little expense. We sow it and winter oats together for a winter pasture, and find that it has no superior for this purpose. Ten to twelve pounds of clover and three pecks of oats gives us the best results. It should be sown as early as possible when sown for pasturage, so that it will attain a good growth before severe weather. We have sown the above on land near our chicken-yard and got paying returns by so doing. The chickens are very fond of it, also of the growing oats. By mixing them we are able to secure an abundance of green feed for the flock the entire winter.

We have experimented largely with it in connection with second-crop potatoes, and find that we can rely on it here. By sowing it alone at the rate of 15 to 18 lbs. per acre, or with rye, 10 to 12 lbs. to three pecks

of rye, we are always able to secure an ideal stand of each, which makes a very fine growth. This forms an excellent winter covering for what would have been naked soil. It also holds the surface soil, thus preventing surface washing. In the spring we also have a splendid crop of green manure to turn under.

We also find it very valuable as a winter crop for young orchards. By sowing it with rye we are sure of one winter crop for our orchards, and are almost sure to secure the two on the same soil at the same time. We have experimented with it in cotton land, sowing it at the last plowing of cotton. Where the land has been well cultivated we usually get a good stand from this sowing. Some of our largest cotton-growers in this section claim that it has no equal for the purpose. One of the most progressive farmers in our county claims that he can grow cotton several years in succession on the same land, and sow crimson clover at the last plowing and leave his soil more fertile each year.

We have tried it with cow peas after wheat and oat harvest, and find the result gratifying. For this purpose 15 lbs. of crimson-clover seed and one bushel of peas gives us splendid results. We cut the peavines for hay when necessary, and still have a fine winter covering for our soil. We find the clover makes a better growth when sown alone. In sowing it with peas we find it best to sow only one bushel of peas per acre. We sowed it and peas together for an experimental test in some corn land, and found the result so pleasing that we shall sow it extensively in our corn land in the future. By sowing it and cow peas together at the last working of the corn, we find we are not only able to grow a grain crop but also two forage crops on our soil at the same time. From the peavines we have often gathered peas that were worth more than the corn crop, also leaving a large amount of nitrogen and humus for the soil in the decaying vines. By mixing crimson clover seed at the rate of 12 to 15 lbs. per acre, and one bushel of peas, we have found that we can secure a vigorous growth that prevents surface washing, also furnishing an abundance of green manure to be turned under in the spring.

From close observation and experience I offer the following to those who are contemplating growing crimson clover: Do not expect to secure a stand unless sown in well-prepared soil. You can not grow it successfully on land that has a sandy subsoil—or at least we can not. We get better results when sown with oats, rye, or cow peas than when sown alone.—*W. C. Crook, Henderson Co., Tenn.*

While the above is all right for Tennessee, some of it needs some modification for Ohio. We have never failed in getting it to winter over here and in Northern Michigan when sown in July or August. With good ground and favorable weather we have also had good success when sown in September. It must get root enough to stand the freezing and thawing in clay soils. So far as I know, it also succeeds when sown with buckwheat. After the buckwheat is harvested, or killed by frost, the clover comes on beautifully.

Temperance.

We copy the following from the outside cover of the *American Issue* for Feb. 8, and hope it will bring a hearty amen from every reader of GLEANINGS:

A religion that leaves the saloon undisturbed, unattacked, is not worthy to be called after the name of Jesus Christ. Again have we reached a time in the march of Christ down the centuries when, if these should hold their peace, the very stones will immediately cry out. This ethical wave against the saloon has come like a hurricane upon the deck of a pirate ship. There is but one explanation—Jesus Christ is walking across the American continent. Every place where his holy foot is lifted leaves a dry spot; and its meaning is, *the liquor-traffic must and shall be destroyed*. Christ is the source. The saloon must die.—*Clinton N. Howard, before Rochester, N. Y., ministers' meeting, January, 1908.*

This Great World History

SENT TO YOUR HOME FREE

Just send your name and address on the coupon below—that is all you need to do. It does not cost one penny and as soon as your name and address is received a set of the World famous Library of Universal History will be sent to you prepaid.

HERE is the greatest opportunity ever offered—an opportunity for our readers to secure at less than half price these fifteen beautiful volumes all printed from large new type, embellished with over 100 double page maps and plans, 700 full page illustrations, many of which are in colors, and over 5,000 pages of reading matter.

This offer is made possible by the failure of the publishers. The Union Book Co., of Chicago. Hundreds of sets of this work have been sold at \$36.00 each and they are worth every cent of it, but we now name you a rock-bottom bankrupt price of only 50c after examination and \$2.00 per month for 12 months. It is impossible to name a lower price for each in full, as this is less than half the publisher's price and is made only to close out the few remaining sets quickly.

Before you decide to buy we invite you to examine this work in your own home for an entire week absolutely free of charge, and should you not want the books after examination we will have them returned at our expense. We earnestly request you to examine this Library; let your wife and children and friends see it. No better set of books could be placed in the hands of children than this; it reads like a thrilling novel, and is in fact a complete connected History of every country, nation and people from the beginning of time to the present year; the greatest World History ever written and endorsed by scholars everywhere.

Prof. George Fellows, of Indiana, says: "Most histories of the World are dreary compilations. This work, however, is clear, interesting and accurate."

Ex Vice-Pres. Stevenson says: "It is a complete record of the human race and should find a place in every Library."

E. Benjamin Andrews, Chancellor of the University of Nebr., says: "Its educational value in the home is sure to be very great."

Rev. Frank W. Gunsaulus, of Chicago, says: "These volumes will be of immense service in stimulating history study in our country. It is a work of real genius."

Prof. Dabney, of Virginia, says: "Southern readers will be gratified at the impartial spirit in which the war for Southern independence is treated."

The St. Louis Globe Democrat says: "This work invests the study of History with a new charm that will be felt by both young and old."

15 Massive Volumes

Each volume 7 inches wide and 10 inches high; weight, boxed, nearly

75 lbs.

NEVER BEFORE in the annals of the publishing business have we seen such a bargain. We do not hesitate to recommend this offer to every reader of this magazine; indeed we believe every family should own a standard World History, for by knowing how other countries than ours are governed, it gives us a better knowledge and higher appreciation of our own system of government and makes us better citizens.

We will be glad to give you an opportunity to see for yourself and make your own decision after you have seen the beautiful binding, the magnificent illustrations and have read parts of this great History of man on earth. Then you can decide. Should you not wish to keep the work you will notify us and we will have it returned at our expense.

The illustration of the books given here does not do them justice; you must see them to realize what they are. You assume no obligation to us or any one else by making this request, you simply ask for a free examination in your own home without paying any one anything, and remember you can send the books back at our expense, and remember, too, this bankrupt rock-bottom price of \$24.50 for this \$36.00 Library has been made possible only on account of the failure of the Union Book Company, thus necessitating a receivers' sale at a price which barely covers the cost of the paper and binding.

MAIL THE COUPON

Here is Our Offer:

and send it to us and we will have this Library sent to you for free examination in your own home. Use a postal or letter if you wish. We send the books not mistaking sample pages—MAIL COUPON. We employ no agents. Address: American Underwriters Corp., Dept. 130, 240 Wabash Ave., Chicago.

Once more we wish to make our offer perfectly clear: Just write your name and address on the coupon, cut out and send it to us for free examination in your own home. We will do. Send us no money.

CUT OR TEAR ON THIS LINE

TWO MONEY MAKERS

SCARFF'S SMALL FRUITS

and bees are an ideal combination for bee-keepers or farmers. Order early and plant a generous quantity of these fruits. The bees pollinize them, making them produce in luxurious abundance, and at the same time increase amount and value of honey.

3 Blackberry Bushes Free. I want to prove how well-rooted, strong and vigorous my plants are. I will send free 3 fine blackberry plants, if you write for my new free catalog. Some of my customers are making over \$350 an acre with my plants. With bees you can increase that profit considerably. I sell a large variety of nursery stock, grown on an 800 acre farm. Write me to-day.

W. N. SCARFF, New Carlisle, Ohio

FREE BOOK FOR YOU

Beautifully Illustrated

Mighty Interesting

If you want to know how to grow big crops of big red strawberries and to get big prices, send for our 1908 book. It tells all about soil preparation, setting, mating, pruning, cultivating, spraying, mulching, picking, packing and marketing. All of these essential features and many more are explained in such a way that you can't go wrong. It was written right out in the strawberry field by a man who has made a fortune growing strawberries, and he tells you just exactly how he does things. Send your address. That's all. The book is free.

R. M. Kellogg Co., Box 400, Three Rivers, Mich.

Paint Without Oil

Remarkable Discovery that Cuts Down the Cost of Paint Seventy-five Per Cent.

A Free Trial Package is Mailed to Every One Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it **Powdrpaint**. It comes in the form of a dry powder, and all that is required is cold water to make a paint weather-proof, fire-proof, and as durable as oil paint. It adheres to any surface, wood, stone, or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer, 202 North St., Adams, N. Y., and he will send you a free trial package, also color-card and full information showing you how you can save a good many dollars. Write to-day

Send for free Catalogue.

The Root Convertible Brooder

Is used indoors with the sash, and outdoors with the galvanized covered doors.

HAVE YOU LOST ANY YOUNG CHICKS

Because of leg weakness ?

Because of sour crop and bowel trouble ?

Because the chicks pile up and smother each other ?

There must have been unnatural conditions that caused your losses, and it is to your interest to look into your brooding equipment.

YOU WILL AGREE WITH US THAT

It's warm dry floors that causes leg weakness; the chicks feet dry up. With the mother hen the chicks would be running on cool, moist earth, and their feet would be cold, but strong and stocky.

You will also agree that the chicks breathing warm air, as they do under the old-fashioned hovers, is what causes sour crops and bowel trouble.

These unnatural conditions do not exist in the Root Brooders, as there the chicks have a cool floor to run on, and there is no hover; the air is not confined; it's free and continually changing.

Our 1908 Catalog gives an accurate and thorough description of the Root Brooders, and will be sent to you upon request.

"Seaboard Magazine" SOUTHERN STATES SEABOARD'S TRONCHOLD Free Sent A MAN'S DISPOSITION

is, without doubt, seriously affected by the climatic conditions which surround him.

ARE YOU PLEASANTLY LOCATED?

Are you shut in by the ice and snow of a rigorous winter, with naught but a cheerless sky to gaze upon? What of your lands now? Covered with snow? How about your stock? Have to be kept housed and fed?

The farmers in our territory are plowing, their stock grazing on the hillside, and in the famous Manatee section growers are shipping their products to Northern markets, receiving remarkable prices for the same, due to the season.

Our lands are just as fertile as yours, produce just as much and at a time when prices are the best. It's a duty you owe yourself and family to look into this.

CLIMATE IS A MOST IMPORTANT FACTOR in connection with the profits, as well as pleasure, to be derived from your location.

Wouldn't you like to be pleasantly situated, surrounded by climatic conditions which permit work to be carried on the entire year, and where the struggle for existence against the elements of a frozen North is not known?

The climate in the six States traversed by our line is unsurpassed anywhere, and the profits being derived by those who only a few years ago were battling with the rigors of winter in a northern location is evidence of the value of our lands. Do you expect to remain where you are and keep up the struggle? Why not come down into southern sunshine and be pleasantly located, while at the same time you are deriving big profits from your crops?

OUR LITERATURE IS FREE. The "Seaboard Magazine," prepared especially for the benefit of parties contemplating a change of location, will help you. Let us put your name on our mailing-list. Drop us a postal to-day.

J. W. White,
General Industrial Agent,
Seaboard Air Line Railway,
Dept. F, Portsmouth, Virginia.

CARTONS FOR OUNCE CAKES OF BEESWAX.

We can supply cartons for one-ounce cakes of beeswax, printed with name and address blank, at 35 cts. per 100; 250 for 80 cts.; 500 for \$1.50; 1000 for \$2.75; by mail, 15 cts. per 100 extra. These prices will also include the large carton to contain 32 of the small ones. The complete package weighs 2 lbs., and, when filled, sells to the dealer at \$1.00. They retail the cakes at 5 cts. each. Retinned molds for molding ounce cakes cost 35 cts. per dozen; by mail, 40 cts.; for two-ounce cakes, 40 cts.; by mail, 50. We do not have cartons to fit the two-ounce cakes. To print your name and address on the cartons will add, 250 or less, 50 cts.; 500, 75 cts.; 1000, \$1.00.

CLOVER SEEDS.

There has been a sharp advance in clover seed, so that the best price at which we can offer Medium Mammoth or alsike seed, choice, is \$12.00 per bushel; half bushel, \$6.25; peck, \$3.25; per lb., 23 cts.; by mail, 32 cts. per lb. Alfalfa seed will have to go at the same price. Medium grades of seed may be furnished a little cheaper. Write for sample and price if interested. Strange as it may seem, white-clover seed is now cheaper than other kinds, and can still be furnished at \$10.00 per bushel; \$5.25 per half bushel; \$2.75 per peck; 20 cts. per lb. Crimson or scarlet clover will be furnished at \$8.75 per bag of two bushels; \$4.50 per bushel; half bushel, \$2.40; peck, \$1.25; 1 lb., 10 cts.; by mail, 20 cts. Unhulled white-sweet-clover seed at \$11.00 per 100 lbs.; \$3.00 for 25 lbs.; \$1.30 for 10 lbs.; 15 cts. per lb.; by mail, 25 cts. Hulled seed, when we have it, 7 cts. per lb. extra.

COLD-FRAME OR HOT-BED SASH.

We are receiving some nice orders for these sash, and we believe that, if more of the truck-gardeners understood how good they are, and the low price at which they may be had, we should be swamped with orders. We have not seen as low prices quoted by anybody else, not even the cut-rate mail-order houses, as we are making on these. Some of our readers may know of greenhouse-men in their neighborhood who do not take this journal, and may do them a favor by calling their attention to our prices. Cypress hot-bed sash, 3½ feet by 6 feet, for four rows of eight-inch glass, with hard-wood round rod crosswise through the bars midway between the ends to help space the bars and hold them secure, striped K. D., 90 cts. each; 5 for \$4.25; 10 for \$8.00. Put together 10 cts. each more, not painted. If painted, add 10 cts. for each coat of paint. If glazed with 8 x 10 glass, add \$1.00 per sash; 8 x 10 glass, \$2.40 per box; 5 boxes at \$2.30, or 10 boxes at \$2.20.

JAMESTOWN, N. Y.

Every Reader of This Paper Will Profit by Writing a Postal for This Free Book Showing How to Double Your Potato Money

We can't, and we don't want to try to tell you in this small space all the good, practical points about how to increase your potato profits because we want YOU as a practical man to send us your name and address and let us mail you this valuable and interesting little book—free.

That's worth your while. Just your name and address sent us on a postal will do.

You'll get the book promptly—free. It tells you the one way to plant potatoes cheapest—how to save seed and cost of fertilizer—how to properly care for your potato field to get best crops easiest with the famous Acme Hand Potato Planter which costs only one dollar complete, express charges prepaid.

Read What Others Say

Secretary Robt. W. Furnas of State Board of Agriculture, Brownville, Neb. says. "I have tested the Acme Hand Potato Planter. To be brief, it fills the bill. It is a wonderfully convenient and valuable little implement."

Agricultural College, Lansing, Mich. says: "Your Acme Hand Potato Planters have outdone our expectations. They will find favor among practical farmers, as they are simple, cheap and save a great deal of labor and do better work. Please send us four more for Spring work."

Our Free Book tells you what others say like J. H. Brown who says: "The Acme is more perfect in its actions than the costly two-horse planters. I planted one acre without stopping and faster than one man could cut the seed. I shall hereafter use the Acme in preference to the hoe or trench method. There is more fun than work in using it."

You'll Say This Too

You can't beat that kind of facts. You'll find they are facts and you'll say so too.

We only ask you to write a postal for this book so you can decide for yourself whether you want to send us only a dollar bill so we can send you an Acme Hand Potato Planter all ready to use complete, with express charges prepaid.

When you do send for an Acme, it's got to satisfy you by the work it shows you it will do, or we return your dollar at once if you simply write us and say so.

Write now for this book anyway. Investigation this way will save you many a day's time—and many a dollar in seed. In fact, planting with an Acme makes potatoes grow much larger crops and this free book tells you why. So write for it. Address

DEEN LOOM

QUICK PROFITS

Flying Shuttle

WHY not put your spare moments to work bringing in extra cash? Some people in your town are waiting for some one to make up their rags into carpets, rugs and portieres.

It's genteel, honest work that any man or woman can do and make good profit at it. Just to prove it, here are the names and addresses of fifteen out of hundreds of people who have woven carpets and rugs at a good profit. They use a Deen Loom.

Good Profits Made At Home

Mrs. C. R. Stover, Bradford, Ohio
Oma Cooper, Dale, Indiana
R. P. McGowan, Piedmont, W. Va.
Mrs. Rob. Record, Seymour, Illinois
Mrs. Henry Clark, St. Anthony, Iowa
Mrs. A. L. Clark, Central Square, N. Y.
Mrs. H. C. Blahot, New Lathrop, Mich.
Mrs. T. E. Alley, Sylvan Grove, Kansas
Mrs. O. E. Albin, Kearney, Nebraska
Mrs. H. Goebel, West Point, Iowa
Mrs. J. S. Gilbert, Milton Junction, Wis.
Mrs. L. E. Foster, Bedford, Indiana
Mrs. Salanda Gunckel, Osgood, Ohio
Mrs. D. E. Williams, Pickering, Missouri
M. H. Vining, Waterloo, Iowa

Remember these are only fifteen of scores and hundreds who at this moment are hustling out work and getting good money for it.

You Who Read This

Haven't you often wished for a useful employment by which to make money in your spare hours? No doubt you know of people who would gladly pay you for weaving their rags into carpets and rugs.

It's not only the poorer people that have hand-woven carpets and rugs on their floors, but well-to-do people of city, village and country-side appreciate the handsome and useful products of home-weavers.

By canvassing among your friends you can work up a good business. Profitable, too. Besides, it's done at home with the children, where you can have an eye on everything in house and yard.

It's Not Hard Work

Weaving with a Deen Loom is soon learned. The Loom itself is a simple affair, easily handled, and soon understood. May Vittum, Barclay, Kansas, says:

"I can weave almost twice as much as I could with the old loom. I would not go back to the old one for anything. The new one is faster, easier, and does the best work."

Having a steel frame well-braced, and rigid, it resists the shock and stroke of the shuttle mechanism, remaining solid for years without repairs.

It will accommodate any size rug or carpet demanded.

What May Be Woven

Any design can be made in any number of colors that taste and fancy may dictate. You can weave rugs, hammocks, all kinds of hand-weaves, carpets, portieres, etc. The materials to use are common carpet warp which can be purchased of any dry goods store; carpet rags, old clothes of any kind, old ingrain and brussels carpets, blankets, or nearly any kind of fabric. Your customers furnish you all material; you do the weaving and get good pay for it.

A Few Prominent Reasons for Buying

- 1.—You can make from \$2 to \$3 a day if you weave 8 hours daily.
- 2.—You can make from \$4 to \$10 a week using only part of your time—say evenings after work and an hour in the morning.
- 3.—We help you personally by letter if you wish. But this is seldom necessary, because we send you simple, detailed instructions with pictures of the loom and its parts. This book makes everything plain. You have no real difficulty in handling the loom.
- 4.—The Fly-Shuttle is easily filled, quick to handle, doesn't bother.
- 5.—The Winding Mechanism and Feed-Governor are new improvements. The latter keeps the warp and weft mechanism within control. It saves much material and prevents hours of throw-away time used by old-style looms.
- 6.—It takes up much less room than many other styles. It requires a room but 10 feet square for a complete weaving shop.
- 7.—We send you everything with the Loom. You can go right to weaving as soon as you get warp and rags.

You Needn't Pay All At Once

Pay something down. As Loom brings in profits send balance by easy installments. Fill in the coupon and mail. We'll send our free catalog and a letter about our easy-pay plan.

CINCINNATI,

OHIO

Honey Markets.

GRADING RULES FOR COMB HONEY.

FANCY.—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

The prices listed below are intended to represent, as nearly as possible, the average market prices at which honey and beeswax are selling at the time of the report in the city mentioned. Unless otherwise stated, this is the price at which sales are being made by commission merchants or by producers direct to the retail merchant. When sales are made by commission merchants, the usual commission (from five to ten per cent) cartage, and freight will be deducted, and in addition there is often a charge for storage by the commission merchant. When sales are made by the producer direct to the retailer, commission and storage, and other charges, are eliminated. Sales made to wholesale houses are usually about ten per cent less than those to retail merchants.

INDIANAPOLIS.—Demand for best grade of extracted honey is good, while comb honey is meeting with slow sales. Very little honey is being offered by producers, and jobbers are carrying a very limited stock. Bottled goods in groceries find slow sales, which can be attributed to dull times; but there is another reason—many bottlers are making the mistake of putting out inferior goods. Jobbers are offering the following prices, delivered here: No. 1 and fancy comb, 16 to 17; extracted white clover, 9 to 10; amber in barrels, slow at 6 to 6½. Beeswax, 28 cents cash or 30 cents in exchange for merchandise. **WALTER S. POWDER,**
Mar. 7. Indianapolis, Ind.

CINCINNATI.—There has been very little demand for honey the past month. We do not look for a good trade until business in general revives and things all around don a more cheerful air. We quote amber extracted honey at from 6 to 7½ according to the quality and quantity purchased. Finer grades of extracted honey sell at 8 to 10 cents. Comb honey is moving very slowly. There is simply no demand for it. We are asking from 16 to 18, according to the quality and quantity. For good to choice yellow beeswax we are paying 30 cts. per lb. cash, and 32 in trade.

THE FRED W. MUTH CO.,
Cincinnati, O.

Feb. 29.

PHILADELPHIA.—Since the holidays honey has been moving very slowly, both comb and extracted, with a very few arrivals from out of town. Comb honey has declined in price, while extracted honey keeps up fairly well, with demand about equal to the supply. We quote: Fancy white comb honey, 16; No. 1 comb honey, 15; amber and off grades, 12 to 13; fancy white in 60-lb. cans, in a small way, 9 to 9½; ambers in cans or barrels, according to grade and quality, sell from 7 cents up. Beeswax, 28. We are producers of honey, and do not handle on commission.

WM. A. SELSER,
10 Vine St., Philadelphia.

Feb. 28.

DENVER.—The demand for comb honey is lighter than usual at this time of year, while the trade in extracted is fairly good. We quote No. 1 white, per case of 24 sections, \$3.25; No. 1 light amber, \$3.10; No. 2, \$2.75 to \$2.90; No. 1 white extracted, 9 to 10; light amber extracted, 8 to 9; strained, 6½ to 7½. We pay 25 cts. per lb. for clean yellow wax delivered here.

THE COLORADO HONEY-PRODUCERS' ASS'N.,
March 3. F. Rauchfuss, Mgr., Denver.

CINCINNATI.—The market on comb honey is very dull. There is no demand. We quote white clover at 16; extracted amber, fair demand at 6 to 6½; water-white sage, brisk at 9½ to 10. Beeswax is selling slowly at \$33.00 per 100 lbs.

C. H. W. WEBER,
Cincinnati, O.

Feb. 29.

Do we handle Good Hives

Do we handle good —SAY! Just read this letter for an answer to *that* question:

Central Tennessee Bee-keepers' Association

Franklin, Tenn., March 2, 1908.

The Fred W. Muth Co., Cincinnati, O.

Dear Sirs:—The hives and supplies I ordered from you came promptly to hand, and I have been busy the past week piling them up. I must say this is the best lot of supplies it has ever been my lot to handle. *They could not be surpassed* in quality of lumber or accuracy of cutting. I am particularly pleased with the MUTH SPECIAL HIVE. It comes nearer being the ideal hive than any other I have ever seen.

Thanking you for the prompt and efficient manner in which the order was filled, I remain
Yours very truly, J. M. BUCHANAN, Secretary.

Unsolicited—right off the Reel of Appreciation! That's the way we get our testimonials—no framed-up requests—customers feel they have to tell us how good we treat them—that's all. Read that letter again, and send for our free catalog of Bee Supplies.

Muth Special Hives

cost no more than any other style of Dovetailed hives, but they're worth 99 per cent more than we ask. The cover and bottom are absolutely warp-proof, and, in addition, there is a honey-board whereby a Porter bee-escape can be placed to take off honey without a sting.

Confidentially, we buy and sell as much honey as any other firm in the business. That's going some! We handle everything the bee-keeper ought to have, and at right prices. Let us prove it to you.

THE FRED W. MUTH COMPANY
51 WALNUT STREET THE BUSY BEE-MEN CINCINNATI, OHIO

CHICAGO.—The market for honey is a dragging one. Sales are few, and volume small. Prices are nominal in view of conditions that are so unsatisfactory. Beeswax sells at 28 to 30. R. A. BURNETT & Co., March 9. Chicago, Ill.

SAN FRANCISCO.—Some water-white extracted is again in the market, but offerings of all lines are very light, and prices are firm. It is reported that some is held in the country, but arrivals are small. Very little is changing hands in this market. We quote: Water-white, comb, 16 to 17; white, 15; water-white, extracted, 8 to 8½; light amber extracted, 7 to 7½; dark amber and candied, 5¼ to 5½.—*Pacific Rural Press*, March 7.

ST. PAUL.—Receipts very light; demand moderate and prices steady. The prices below represent those obtained for shipment in small lots. Fancy white clover, new, 18; fancy Cal., 24 combs in a case, \$4.00; strained, in 60-lb. cans, 10. W. H. PATTON, Sec., March 9. St. Paul, Minn.

KANSAS CITY.—The receipts of comb honey are more liberal. The demand for both comb and extracted is light. We quote: Fancy white, 24-section case, \$3.25; No. 1, white, \$3.00; No. 2 and amber, \$2.75; extracted white, 8; amber, 7. Beeswax, 23. C. C. CLEMONS & Co., Kansas City, Mo.

Mar. 3.

LIVERPOOL.—Market fair, slow demand. Quotations to-day are, honey, Chilean, 3¼ to 6½; Peruvian, 3¼ to 6½; California, 7½ to 9¼; Jamaican, 4 to 9¼. Beeswax, African, 28 to 29; Jamaican, 34 to 35; American, 30 to 33; West Indian, 29 to 32; Chilean, 30 to 35. TAYLOR & Co., Feb. 22. 7 Tithebarn St., Liverpool.

READ WHAT EXPERTS SAY OF IT

The Christmas mail brought me what is probably as useful and beautiful a Christmas present as I ever received—a morocco-bound copy of the new edition of the A B C and X Y Z of Bee Culture. Bee books and journals have come to my desk of which it seemed as though the least said the better. Not so with this book. On the contrary, it seems as though words were lacking to do it justice. There are many other bee-books, each filling its niche, but, in all the world, there is nothing so comprehensive as the A B C and X Y Z of Bee Culture. There is no point in the wide domain of apiculture that is not touched upon in this volume, and the information is the very latest and most authentic, well written and well illustrated. The amateur and the expert are both served equally well.—W. Z. HUTCHINSON, editor and proprietor of the *Bee-keepers' Review*, and author of *Advanced Bee Culture*.

No bee-keeper's library can be at all complete without a copy of this magnificent aparian work. It has reached a sale of over 100,000 copies already, being the most largely sold book on bees in the world. Better send to us for a copy to read during the long winter evenings.—*American Bee Journal*.

This work of 536 pages is, as its name implies, a complete cyclopaedia of every thing pertaining to bees and bee-keeping. It was originally compiled by A. I. Root, who in the 1877 preface, after stating his indebtedness to Langstroth, Quinby, and others, says that, "A great part of this A B C book is really the work of the people, and the task that devolves on me is to collect, condense, verify, and utilize what has been scattered through thousands of letters for years past." Since the first copy of this work appeared, now thirty-one years ago, it has undergone many revisions, and has had many additions, both of letterpress and illustrations, while the rapid advancement in bee culture has made it necessary in many cases to remove whole articles and rewrite them entirely. The revision has been ably carried out by E. R. Root, the present editor of *GLEANINGS*, who has had the assistance of a number of well-known and able men. In the preface the names of the writers of the different articles are given. For instance, we find Dr. C. C. Miller writes on honey-comb and out-apiaries; Dr. E. F. Phillips on the eye, parthenogenesis, and scent of bees; E. R. and H. H. Root on wax and wintering, both of these having carried out a number of experiments on these subjects. There are also articles by W. K. Morrison and Mrs. Comstock. It seems almost superfluous to say anything about a book of which already 100,000 copies have been sold; the simple fact speaks for itself that it fills a want, and is an attestation of its worth. Among the articles that have been revised we find the new methods of queen-rearing described, so that the practical bee-keeper will have the latest and best ideas on the subject before him for reference. The new methods of wax-production are treated in an exhaustive manner, and as this subject is of more importance than formerly, greater space has been devoted to it. We have nothing but good words for this work, and recommend our readers to get a copy of the 1908 edition. The work is profusely illustrated and beautifully printed, and is a credit to the publishers.—By T. W. COWAN, Esq., editor of the *British Bee Journal*. Mr. Cowan is the author of two first-class books on bees and bee-keeping, "The Bee-keeper's Guide," and "The Honey-bee."

SAVING MONEY ON AN INCUBATOR.

The Belle City Incubator Co., box 69, Racine, Wis., have asked us to make special mention of the fact that they are now making a phenomenally low offer to incubator purchasers. It is this: They agree to furnish (freight prepaid) a 120-egg incubator, guaranteed perfect, at just half the usual rate, or \$7.15. For only \$11.00 they will include with the incubator a good brooder which ordinarily costs from \$6.00 to \$9.00. This is what they term a bargain offer, and it certainly looks like that to us. They strongly guarantee both the incubator and brooder, so one need not hesitate to buy. It would be well to look up the advertisement of this firm on page 381 of this issue; and while you have the matter in mind it might also be well to order a copy of their book, "Hatching Facts," which they send free. Poultry catalogs are generally worth sending for, and this one certainly is no exception to the rule.

"SURE HATCH" INCUBATORS.

The makers of these famous incubators are very anxious to have all the poultry-raisers who read this journal send to them for their latest catalog. They believe that this will be to the mutual advantage of both parties. Their catalog shows how hundreds of men and women are making money with their poultry by using the Sure Hatch incubators. These chicken-machines are made in all sizes, from that of the small amateur to the bonanza professional. They are shipped with the freight prepaid, either from the factory at Fremont, Neb., or from the branch at Indianapolis. This insures quick delivery. To make assurance doubly sure, the maker of the Sure Hatch insures the machine against breakage for five years. This seems like a long time to guarantee a machine of this description, but we do not doubt for a moment that they will replace a broken part within that time. To get better acquainted it would be well to get their book, entitled "Poultry Profits." It is very surprising, the great amount of valuable knowledge which may be found in an incubator catalog.

WHAT BRIGHT MEN SAY OF GLEANINGS

Hear what an Authority on Trade Journalism says of GLEANINGS. It is written by Editor F. Dundas Todd, formerly of the PHOTO-BEACON, Chicago, Ill.

I enclose one dollar to pay for my subscription to GLEANINGS. I want the bee knowledge you provide—emphatically want it, for you are running one of the finest trade papers that is printed, and, for a house organ, one that is remarkably free from house prejudice. You are a first-rate editor, and I want to tell you frankly what I think of you. I can speak plainly when I kick, but I try, even if it be a trifle harder, to be as plain when I like what a fellow does.

After receiving the foregoing we wrote Mr. Todd, asking if he would have any objections to our using this paragraph. In reply he writes as follows:

Why, certainly use the paragraph of my letter. You deserve it. I have been journalist long enough to develop contempt for a selfish stock-house journal, and to admire a man who can see bigger and wider, as you can. In photography the one-sided house journals have all failed; and as a money proposition only, you are wise to be open. I like the way you throw the columns open to ideas that conflict with the goods your firm manufactures.

The accusation has been made in times past that this journal was biased in the interests of our supply business. Our editorial force have been instructed to publish the truth about any thing and every thing, no matter whether it conflicts with the supply business or not. We have certainly made an honest effort; and if we have succeeded in the minds of unprejudiced, candid observers it is no small gratification. Mr. Todd has been long in the editorial field and the general publishing business, and his statement certainly should have weight.

What a Celebrated Authority on Farming says:

Hudson, O., Jan. 8, 1908.

Dear Mr. Root:—I want to congratulate you and your sons, and all others connected with GLEANINGS, on the great improvements you have been making on this magazine. Its columns are filled with helpful articles, and nothing that isn't of the highest tone ever appears. It is beautiful in its make-up. The paper, printing, and pictures are strictly first-class. The double-page picture in the Jan. 1st issue is fine enough to frame. It is an educational matter to the young people (and we all ought to keep young) to have so perfect a magazine come into the home. Even the advertisements teach order, Heaven's first law, and neatness and harmony. And now the magazine comes in an envelope, unrolled. It would have pleased you to hear what I said when the first copy came in that improved condition. I enjoy nice things—beautiful and perfect things. For weeks I have had it on my mind to write you, but didn't get at it; but when I read page 43 I went directly up to my study and got busy.

T. B. TERRY, Hudson, O.

We highly appreciate the foregoing, knowing Mr. Terry's opinions are not for sale at any price. Moreover, he is one of our best authorities on general farming and rural life in the United States. He is one of nature's noblemen, self-educated, self-reliant, and true. Most of our readers know of Mr. Terry, and admire him for the work he has accomplished. Coming from so worthy a man, this testimonial has a peculiar value to us.

Read what Mr. Hunter, the Corn King of Ohio, has to say:

The A. I. Root Co., Medina, O.

Seven Mile, O., July 10, 1907.

Gentlemen:—I have a great respect for GLEANINGS, and, on our table, containing twenty to thirty of the leading journals and papers, it is the gem of the lot.

Yours very truly, CALVIN S. HUNTER.

What the late Veteran Henry Alley said:

Had I been well I surely would have sent you some strong praise of the several copies of GLEANINGS. You have outdone yourselves. No magazine or publication I have seen comes up to the beauty, both outside and in, of any copy of GLEANINGS.

Mr. Alley's opinions were never for sale at any price, and what he said he meant in very truth.

HOW TO SAVE THE TREES.

It has been demonstrated beyond all peradventure that the only reliable way to protect trees from blight and insect pests is to spray them; and no first-class park or private garden is now considered complete without a thoroughly efficient outfit for spraying even the loftiest trees.

The chemicals which have hitherto been used by the farmers to protect their fruit-trees are now being freely used by all public parks and cemeteries with any pretensions to perfection of management. The trees are kept in better health, they look greener, hold their leaves longer, and, of course, are really more beautiful to the eye of man. To do this work, power-driven spraying-machines are needed.

One of the best firms we are acquainted with in this line of work is the old reliable firm, The Deming Co., of Salem, O., who manufacture on a large scale every sort of spraying-apparatus of the most modern description.

The most powerful machine they make is a gasoline-power apparatus which does the business in a masterly, wholesale fashion, by which a big orchard may be sprayed in short order. But they also make apparatus to meet the wants of the smallest garden. We have no doubt that all the outfits turned out by the Deming Co. are thoroughly efficient and satisfactory when used according to directions. They have an enviable reputation of years' standing. Drop the company your address on a postal card, and they agree to send you promptly by return mail some very interesting literature on insect pests, etc.

QUITE A BOOK.

The Ohio Carriage Manufacturing Co., of Columbus, Ohio, have just turned off the press one of the handsomest catalogs ever issued by any firm. Of course, it's free; but it takes quite a lot of money to turn out such a catalog. It is intended to show in a masterly manner the various styles of "split hickory" vehicles made by the firm. It is our opinion that it will do this better than a flying visit to a warehouse where one sees, the different carriages for less than half a minute. With this handsome book a prospective buyer can sit down of a winter evening and devote an hour, more or less, to the study of each particular style he is interested in.

In spite of the great cost of such a catalog, this firm is probably able to offer you a vehicle very much cheaper than one which maintains show-warehouses, agents, and a big staff of salesmen. We know they are thoroughly reliable, having sold carriages in this manner for many years. If you are at all interested we strongly advise sending for this book, even if you do not require a vehicle right now. Take time to study it.

CATALOGS RECEIVED.

Catalog of cypress tanks for holding water and other liquids, by W. E. Caldwell, Louisville, Ky.

Catalog of "Roof-Fix," a liquid material guaranteed to stop leaks in roofs. The Anderson Manufacturing Co., Elyria, Ohio.

The "Good Enough" incubator, brooder, and bee-hive catalog of C. J. Werner, Superior, Nebraska. Interesting to western readers.

BEES VS. LABOR

In other words, shall a man spend all his time with a limited number of colonies, giving them extra care, or shall he adopt short-cut methods and

"KEEP MORE BEES" ?

Probably this subject never had a more thorough overhauling than it receives in the March issue of the *Bee-keepers' Review*, and from such men as Taylor, Townsend, Doolittle, and the editor—seven pages are devoted to the discussion.

Another excellent topic in this issue is handled by that veteran of Northern Michigan, Mr. S. D. Chapman, and I think he puts up the best argument yet made in favor of

REQUEENING ANNUALLY.

He tells why he requeens, how he does the work, and then shows that the cost need not exceed five cents per colony—and that for labor.

The *Review* is always packed full of just such interesting,

REALLY HELPFUL,

practical articles as these. It is one of the journals that the man keeping bees to make money can't afford to do without.

Just at present you can get all the back numbers of 1907, and your name on the subscription list for 1908, for only \$1.00, but some of the issues of 1907 are

GETTING PRETTY LOW,

and you ought to order soon if you wish a complete file for 1907.

Your money back if you are not satisfied when you get the back numbers, and you may keep the back numbers in the bargain.

W. Z. HUTCHINSON,

..

..

FLINT, MICH.

QUEENS FOR 1908

J. E. HAND, the veteran bee-keeper and EXPERT QUEEN-BREEDER, will devote a part of his time the coming season to the rearing of CHOICE QUEENS from a superior strain of LONG-TONGUE RED-CLOVER ITALIANS that have gained a world-wide reputation for HARDINESS, GENTLENESS, AND SUPERIOR HONEY-GATHERING QUALITIES. Send for his circular. It will open your eyes to a few points in queen-rearing that will save you dollars.

TO THE BEE - KEEPERS OF CANADA.

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the QUALITY. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, "The best is cheapest."

THE A. I. ROOT COMPANY
SYRACUSE, :: :: :: NEW YORK

BEE KEEPING will be a profitable industry this season.

Honey is high—short crop last year. The shortage of the honey crop for 1907 in the United States warrants bee-keepers to increase their colonies. About a half crop was produced, and in California, where the cheap honey comes from, only a quarter of the average crop was produced.

Get Ready Now for More Honey

Let us send you our catalog. We are manufacturers and sell only our own make of bee-supplies. Minneapolis is the largest lumber-distributing point; the Mississippi river furnishes us power, and our organization and labor conditions are the best for economical production. Send us an estimate of your requirements and let us give you prices. We have a large stock of standard bee-supplies on hand.

Queens Queens

of the

FINEST POSSIBLE BREEDING

BRED BY

F. J. WARDELL,
UHRICHSVILLE, OHIO, U. S. A.

After many years' experience as head queen-breeder for The A. I. Root Co., I am now breeding bees at the above address. My stock is equal to any now advertised, and my long experience enables me to judge very accurately the value of any strain. Mine is the celebrated red-clover stock, which has given so much satisfaction to thousands of buyers for a number of years past. If you desire something very select for breeding purposes, write to me, stating your wants, and the same will be supplied. I have no cheap or inferior queens to sell. My prices for the season are as follows:

	May to June.
Untested queen	\$1.25
Select untested queen	1.50
Tested queen	2.50
Select tested queen	3.50
Breeding queens	6.00
Select breeding queens	9.00
Extra select	1 year old, 12.00

No untested queens sent before May 15; but to secure your queens early in the season it is necessary to order now. Absolutely, all orders filled in rotation.

Taylor's Queens for 1908

J. W. Taylor & Son have made a specialty of breeding for the best honey-gatherers. Our three and five banded Italians can't be beat, or haven't been, as honey-gatherers. Untested, \$1.00 each, or \$9.00 a dozen; tested queens, \$1.25 each, or \$12.00 a dozen. Select tested queens, \$1.50 each; breeders, the very best, \$3.00 to \$5.00 each. Send all orders to

J. W. TAYLOR & SON, Beeville, Bee Co., Texas.

Queens FOR 1908.

Finest Goldens bred in America. Send for my latest circular and prices — "and be convinced."

DANIEL WURTH, PITKIN, ARK.

How are Your Bees?

Any Queenless Colonies?

If so, send for a queen at once. We can furnish by return mail fine tested queens, reared last fall, wintered in four-frame nuclei, three-banded Italians, none better, \$1.00 each. Satisfaction guaranteed. Send for price list.

J. W. K. SHAW & CO.,
Iberia Parish. Loreauville, La.

FREE! 50 lbs. Comb Foundation FREE!

WEED'S NEW-PROCESS COMB FOUNDATION.

PRIZES GIVEN AWAY

ABSOLUTELY FREE IN A CONTEST.

FIRST PRIZE—25 lbs. Comb Fdn.

THIRD PRIZE—5 lbs. Comb Fdn.

SECOND " —10 lbs. Comb Fdn.

FOURTH " —5 lbs. Comb Fdn.

FIFTH PRIZE—5 lbs. Comb Fdn.

THE ABOVE PRIZES will be given absolutely free to those who will make the largest number of words out of the letters found in the name "Toepperwein." The letters may be used over as many times as desired, but in no single word oftener than found in the name "Toepperwein." Only words found in Webster's dictionary are admitted. The words must all be plainly written in columns, and numbered.

This contest is absolutely free to any one and anywhere. It is a fair contest, and one has the same chance as the other. These contests are very instructive, and just the thing for schoolchildren to pass the evenings. The contest will close May 1, 1908, and all lists with words must then be in, and in May 15th GLEANINGS the results will be published, giving the names of the winners and all the words of the one who wins the first prize. The winners have the privilege of choosing any grade of foundation. We feel confident that the winners will be highly pleased with the prizes, as the comb foundation is as fine and perfect as any machinery can make, and is made right here in our factory out of this clear Southern beeswax.

Now do not lay this aside and put it off until some other time, but begin right now and start the list. Write the words in a little memorandum-book and carry it in your pocket; and every time you think of another word mark it down. There are a great many words to be made out of the name "Toepperwein," and you have just as good a chance as any one else; so do not let any time go by, thinking some one else may have more words. Now, understand you are welcome to enter this contest, no matter whether you own bees or not, nor whether you are old or young, nor where you live. In case any of the winners have even numbers, then the amounts will be equally divided between such winners.

ROOT'S BEE-SUPPLIES.

We always carry a large and complete stock of The A. I. Root Co.'s make of bee-supplies at Root's factory prices. Write us for illustrated catalog and price list.

HONEY AND BEESWAX.

We buy honey and beeswax at all times. If you have any to offer, write us stating quantity you have, quality, and your best price delivered at San Antonio. We also work beeswax into comb foundation by the pound at reasonable rates. We should like to have some business from associations in other States who have large quantities to work up. Our capacity is 500 lbs. per day.

We have just received a set of new machinery, and our *Weed New Process Foundation* is perfect and gives perfect satisfaction everywhere.

Whenever you are in San Antonio make our office your headquarters and let us show you through our plant. Stay here a while and meet the bee-keepers as they come in. You are always welcome and will be courteously treated.

UDO & MAX TOEPPERWEIN,
1322 South Flores St. **SAN ANTONIO, TEXAS.**

**"If goods are wanted quick, send to Pouder."
Established 1889.**

"Bee in His Bonnet."

By the Bee Crank.

The old Scotch expression related to the visionary in contrast with the man of action. But it isn't exactly square to the bee, who may buzz a little now and then, just for recreation, to compare it with the folks who do nothing else. Now, if you have been building air castles on the honey harvest you expect to gather this season and have made no definite plans, have neglected to order your supplies, why not get busy **now?**

The best is none too good for you. You can't afford any other kind. You want Root's goods and you want them of Pouder, because he can get them to you quickly. I have

sixteen railroads and almost as many electric roads at my command, and I can make prompt and economical shipments of hives, sections, comb foundation, and any other supplies that you may need.

My new catalog will help you in planning for your new equipment, and a postal brings it.

Beeswax Wanted. I pay highest market price for beeswax, cash or trade. I will allow 28 cents cash or 30 cents in exchange for supplies. If you wish to exchange for foundation, I will ship foundation the day wax arrives. Send large shipments by freight and small ones by express.

Walter S. Pouder,

513-515 Massachusetts Avenue, Indianapolis, Ind.

A. L. BOYDEN, ADVERTISING MGR.
J. T. CALVERT, BUSINESS MGR.
A. I. ROOT, EDITOR OF HOME DEPARTMENT

Vol. XXXVI.

MARCH 15, 1908.

No. 6

DR. BRUENNICH, *Leipz. Bztg.*, 24, reports a young queen stinging a worker to death. I saw one case of the kind, and never but one.

THAT PARCELS-POST rate of 5 cents for first pound and 2 cents for each additional pound, p. 279, has reference only to a distributing office and its rural routes, and could never apply to a distance as great as 100 miles.

G. K. HUBBARD writes: "I wonder if it would not fulfill the requirements of the Nebraska pure-food law to label a case of comb honey 'None of the sections in this case weigh less than 14 oz. or more than 17 oz.'" I'm wondering to see what those Nebraskans do.

YOUR ANSWER, Mr. Editor, page 276, that more than $\frac{1}{4}$ inch between bottom-bars of Langstroth frames is needed to look up between them, clears the matter. I never think of looking between bottom-bars, and didn't know that other people did. Of course, $\frac{1}{4}$ inch wouldn't give much chance for looking.

ASPHALT PAPER is strongly recommended, *Deutsche Bzcht.*, 18, to put in the bottom of hives in winter to catch the droppings. Does that mean asbestos paper, or what? [Asphalt is similar to tar; but, unlike tar, has no odor, and will stand a greater degree of heat without running or becoming sticky. It therefore makes a coating much superior to tar. In short, asphalt paper looks like tar paper, but is much superior to it.—ED.]

I AGREE with all you say, Mr. Editor, p. 276, about testing heat by the hand, and most emphatically when you advise measuring by a thermometer. Please note that I gave no conclusions—merely items of the experiment. The objection to using the hand for a thermometer, aside from the great

variation of hands, is emphasized by the chance for misunderstanding as illustrated by your urging *holding* instead of *dipping*, neither of which words is given in the report. Hershisier said "stand" and you said "put," either of which might mean a quick dip or holding ten minutes.

F. DUNDAS TODD suggests "division" as a name for one of the parts of a divisible hive. Sounds all right, and doesn't bump into the name of any thing else in bee-keeping. [We have no objections to the word "division." In referring to this general subject we may say that we have a big grist of matter on the proper word to designate the several parts of a divisible-brood-chamber hive. Owing to the crowded condition of our columns we shall not be able to publish any of these articles; but we will say right here that we favor the word "division," and suggest that our correspondents adopt it. In any case we wish them to use *any* phrase or word that can not be misconstrued. Brevity, at the expense of clearness, always defeats itself.—ED]

ALLEN LATHAM, you've filled page 291 with exceedingly interesting reading. I've always counted you a genius; but how can I succeed in getting bees to do such remarkable work with bottom-starters is beyond me—must be locality. That queen reared by me, whose bees filled sections with "solid chunks of honey with daylight showing all around the chunk except at the top." I am sure that queen would not have acted so if she had stayed here—at least I could not possibly get my bees to do such a thing here, and all that bad work that you tell about your other bees doing with bottom-starters—why, I couldn't possibly get my bees to do anything of the kind. They just make beautiful sections, tons and tons of them, with no imperfections, and with no effort on my part. You say you follow my directions and "use a bottom-starter not over half an inch wide, and usually less." *Et tu, Brute!* Where did you ever see me advise any thing less than $\frac{1}{2}$ inch? But I can hardly believe that so shallow a starter can cause all the trouble. Seriously I can not understand it at all, and I'd give two spools and a potato

pop-gun to talk it over with you for half an hour.

I wish, however, you might try this: In the same super put part of the sections with bottom-starters less than $\frac{1}{2}$ inch, and part $\frac{3}{4}$ inch. It may be it wouldn't work so well with "extra-thin" foundation. I use "thin."

C. P. DADANT says that if bees are unusually long-lived it's because they are lazy. I don't want to believe that if I can help it. Of course, there's no denying that bees live longer when idle than when working hard, and so it may be that some colonies have a longer lease of life just because each worker takes life easy. But that does not conflict with the possibility that there may be such a thing as a colony whose workers live longer than the average, while at the same time working just as hard as the average. And in consideration of the fact that the average life of a bee as a fielder is 26 days or less, the addition of a single day to its gathering career is an important item; for I take it for granted that the added day would be on the fielding end.

Now, what could I afford to pay for a queen which would result in that added day for a whole apiary?

Suppose one has an average crop of 10,000 lbs. annually, at 15 cts. a pound, bringing \$1500. One twenty-sixth of that is \$57.00. A queen that would bring that *annual* increase would be cheap at \$50.00—yes, at \$100.

YOUR BELIEF, Mr. Editor, p. 275, that thick syrup "may be better than a thin one which the bees are required at some expense to their vitality to reduce down to the body of ordinary honey," is all right for late feeding; for early feeding, I doubt. Evaporating is then a regular business of the bees, and I don't believe it is any such great strain on them. An important point is that, along with the evaporating, they make the feed better. [We fed thin syrup last fall, early in the season; but along in December we noticed in some colonies an alarming diminution in the force of the bees. While we do not say positively, yet we are a little fearful that this early feeding with thin syrup wore out bees that might have been useful in maintaining the body heat of the cluster during winter.

And, again, is it definitely established that the syrup which the bees invert is a better winter food than one which they can not invert, or, at least, to only a small extent? In view of recent testimony we confess to a feeling of uncertainty on both of these propositions.—Ed.]

SOME THINGS said about improvement of stock are likely to scare out the average bee-keeper from any attempt in that direction. The different characteristics to be striven for are martialed in array, and he at once throws up his hands in despair. "What can I do about all those things? For instance, 'strength of wing for sustained flight.' Can I go around to each colony, feel of the wings, and decide which is strongest?"

Well, whatever may be the best way, there

is one thing certain: The rawest beginner can do something to make his stock better than if he did nothing. That something is merely to breed constantly from the colony that gives the biggest yield. For, after all, the most scientific breeder, who has each trait laid out to breed for, is aiming toward such a combination of traits as shall lead to the greatest yield. The beginner can aim at the same thing by paying no attention to individual traits, only keeping track of yield alone; and, although he may not do as well as the scientific breeder, he'll go a long way in that direction. At any rate I feel sure that by just such a course I've increased my income from my bees quite materially.

OWING to excessive demands on our space we shall be compelled to leave out of this issue some special articles on spring management until our next number.

SWARTHMORE (Mr. E. L. Pratt) has been engaged to give two days' instruction in queen-rearing at the Apicultural School of the Bee-keepers' Association at Vienna, Austria, next June.

It is said the Royal Baking Powder Company has acquired, within the last few weeks, two great factories near Chicago which they intend to use for the manufacture of glucose in opposition to the Corn Products Co. It is said the latter are chagrined over this move. The sale is the direct outcome of the recent decision of President Roosevelt, which allowed the use of the words "corn syrup" instead of "glucose."

A SURPLUS OF GOOD COPY.

WE are fairly buried up with good copy, and it will be some months before we can reach it all. Possibly some of it we may not be able to insert in our columns until after it is out of date. We think it only fair to make this statement so that if any of our contributors desire the return of any unused manuscript, so that they may use it elsewhere, they may instruct us accordingly. Of course, we get any amount of matter, but probably less than a tenth of it is set aside to be used as our space will permit.

BEE-KEEPING IN CALIFORNIA.

It is a pleasure to note that the publication known as *Sunset Magazine*, published in San Francisco, has an accurate and truthful article on bee-keeping in California, in the

March number. The article bears the title, "Among the Honey-makers," and is by M. E. Dudley. It is primarily designed for the gentler sex, but the men-folks can read it too. It places the honey production of California in a good year at 4500 tons. Several fine views of apiaries accompany the text.

LABELING THE WEIGHT.

THE clause of the Nebraska pure-food law, which requires the labeling of the weight on all food packages, has just been declared unconstitutional by the circuit court in the case of the State vs. Swift & Co., the beef-packers. The law required *the true net weight* to be printed on all packages.

CONDITIONS FAVORABLE FOR A CROP IN TEXAS AND CALIFORNIA.

THE latest reports from various sources indicate that there will be a fair crop of honey from California this season. The old crop has been entirely cleaned out, and prices on the coast are remarkably stiff.

Reports from Texas are also very favorable. But during the last two poor years many bees have died, letting their owners become discouraged. But the survivors (it is always the survival of the fittest) ought to be able to get good returns, and to make up for the two poor years that Texas has had.

OVERLOOKED, PERHAPS.

ONE of the most readable and interesting sections of a modern magazine is the advertising pages—that is to say, if the publisher exercises due care in the selection of advertisers. One of the features of GLEANINGS likely to be overlooked in this connection is the index to advertisements which some journals do not contain, but which is quite a help to the reader. Another feature which some may not have noticed is the department of foreign honey markets. To some of our readers it must be interesting reading.

ALEXANDER'S LOCALITY.

SEVERAL of our correspondents take issue with Mr. E. W. Alexander on the matter of spring feeding. One or two fail to take into consideration that his locality is noticeably different from their own; for his main honey-flow (buckwheat) does not come on until middle or late summer, while that of most of our subscribers begins in early summer. After one sees Mr. Alexander's special environment he would, perhaps, feel less inclined to criticise his methods. But this does not necessarily signify that the average reader would do well to follow his advice for a locality with different conditions.

OVERCOATS FOR BEES.

MR. N. E. FRANCE, in this issue, in the special series of articles, draws attention to the fact that many bee-keepers who would not think of going outdoors without an over-

coat in chilly weather will nevertheless take their cellar-wintered colonies out of a warm dry cellar and put them on their summer stands without any protection. What is good for man must also be good for bees. The evidence in this issue shows quite conclusively the value of paper winter cases for spring protection. Shall we give our bees overcoats, or shall we let them stand out in the open, where they must necessarily suffer by reason of the sudden change from indoors to out?

SPRING OR FALL FEEDING—WHICH?

IT will be noticed that the trend of the articles on spring management in this issue is against spring feeding. There are more to follow in the next issue, of the same import. It has for years been considered a wise policy to stimulate brood-rearing in late spring by feeding. Even so good an authority as E. W. Alexander still advocates it; and not only that, but he recommends extracting and feeding back in dilute form. We are curious to know whether the majority of our readers have found spring feeding to be detrimental. No one would question for a minute that colonies short of stores ought to be fed in the spring; but the question is, should the bees be fed up in the fall, and fed liberally, to carry them until settled warm weather, or should they be fed just enough to carry them through winter, and then give them more feed in the spring to stimulate?

There would not be space enough for us to insert extended articles on this subject; but we should like to have two or three hundred postal-card responses. The answers must be couched in not more than two or three sentences. Just write what you have found to give the best results—fall or spring feeding.

HAS THE ADMINISTRATION BEGUN TO WEAKEN THE NATIONAL PURE-FOOD LAW?

OUR readers will remember that we requested them to write to Secretary Wilson and President Roosevelt to sustain the decision of the Board of Food and Drug Inspection to the effect that glucose be called *glucose* and not "corn syrup." As stated in our last issue, the administration revoked this decision, by which the manufacturers of glucose can now cover up to a great extent the identity of their product under the innocent name of "corn syrup," as if it were a sort of sorghum. The fact is, the glucose people, with their unlimited capital, could send down to Washington chemists and big lawyers by the score, who could present all kinds of plausible reasons; and these same interests, of course, left no stone unturned in the way of getting letters sent in, urging and demanding a recognition of their side of the controversy, while bee-keepers and others had no one on the ground to champion their interests.

Referring to the decision of the administration on this point, the *American Grocer*, published in New York, has this to say:

It is time for the administration to stop taking to itself credit for the enactment of a national pure-food law, now that it has practically nullified one of its most important provisions, namely, an honest label. It has decreed that a syrup made by converting the starch of corn, through the action of hydrochloric acid, may be called corn syrup and not glucose, as it is named commercially.

This decision strikes at the vitals of the food law and opens the way to blenders of spirits to sell their product as whisky; for the users of that fraud, saccharin, to resume operations again, so that the flavor of creosote will again be found in preserved fruits and canned corn.

It is up to the administration to ask Congressmen to introduce at the White House some distillers of pure whisky and manufacturers of pure food, who understand the art of putting up mincemeat, fruit butters, catsups, jams, jellies, and preserves, without the use of chemical preservatives. Thus far the delegations have been from the ranks of whisky-blenders, the users of coal-tar colors, preservatives, and the makers of "corn syrup." They preach the gospel of license; juggle with names with the exception of the honest users of benzoate of soda, who advocate their product being labeled as containing the much-debated article.

There is a national election ahead, and the grocery trade and its allied branches have half a million votes, and we trust every voter interested in pure food will note how the party in power has begun a campaign to nullify the most popular law passed by Congress, and again open the sluiceway of adulteration. Do not be fooled with party protests asserting credit for passing a national pure-food law which is intended to stop absolutely the sale of unwholesome food and secure honest labeling. The ballots of the grocers can punish the sinners.

We do not look at this matter quite as seriously as does our contemporary. If the administration has made a mistake (as it surely has) the mighty protest that is going to be raised will make the "powers that be" more careful in rendering decisions of an allied character in the future.

Of course, this most unfortunate decision will be used as a powerful precedent. The blenders of whisky, and all others who desire to conceal and cover up certain ingredients, are doubtless having a regular jollification, for now they have a precedent by which there is a chance and even a likelihood that they can, to some extent at least, misbrand their product. But be it said to the everlasting credit of Dr. H. W. Wiley, he stoutly stood out against the cabinet. Even though our great and good President, influenced by the majority of his subordinates, was made to feel that "corn syrup" was the proper and legitimate name for glucose, yet, notwithstanding, Dr. Wiley dared to stand alone.

Our government officials can not be too strenuous in enforcing the provisions of the national pure-food law. Their decisions, therefore, should be on the side of safety rather than take the chance of opening the floodgates of fraud.

HOW GLUCOSE (CORN SYRUP) IS MADE.

THE following clipping was sent through the mails, and we reproduce it here for the benefit of our readers:

Although the glucose-factories all have a big sign of "No Admittance" nailed to their doors, I was once admitted with a chemist, and had the process of the manufacture of glucose described to me as it was being done. The corn is first ground, then soaked in water to get the starch, and the starch water is boiled with sulphuric acid added in the proportion of 1 quart of the acid to 100 gallons of the starch water. This is

then sweetened with cane syrup, my Early Amber cane syrup being largely used for this purpose because of its being strongest in saccharine matter. The syrup thus made contains only one-sixth saccharine content, and this is the syrup most people buy. The State Board of Health does not consider this glucose syrup wholesome, and at the Red Wing and Faribault institutions they now make their own syrup.

Glucose is bad for the stomach and kidneys. Scientific physicians claim that the strong mineral acid used in its manufacture destroys the fine tissues of the kidneys.

Farmers can protect themselves against this enemy to health by growing the amber cane and manufacturing their own syrup.

We do not know in what publication this appeared, but no matter. The statements are, in the main, correct, except that hydrochloric acid instead of sulphuric is used in this country, and one process is left out—namely, that soda, after the boiling in hydrochloric acid, is put in the mixture to neutralize the soda—or, rather, we should say, the soda combines with the acid, forming common salt. But, unfortunately for the American stomach, this soda does not take up all the acid; and the capitalists back of the glucose interests, we understand, would give millions if some chemist would tell them *how* this could be done in a *commercial* way. It can be accomplished in the laboratory, but at great expense; but in the glucose-factories it is impracticable, and consequently the glucose in the markets, in its various forms under the name of "corn syrup" and its compounds, contains some unneutralized hydrochloric or sulphuric acid, and this is what plays the mischief with our digestive apparatus. We may disguise the so-called corn syrup (glucose) by putting in cane syrup, but the injurious agent is there just the same.

Reference is made to the fact that "No Admittance" is nailed up on the doors of the glucose-factories. We have been trying to get our chemist into some one of these concerns for several years back, but without success. The fact is, the glucose people do not want the outside public to know the process of manufacturing their product; and now it has leaked out that the wooden buildings in which glucose is made are very short-lived because of the destructive action of the acid fumes during the process of manufacture.

Bee-keepers, on the other hand, have no secrets to cover up. Their bee-yards and their supply-factories are open to the inspection of all reasonable and fair-minded people, especially reporters.

THE DIFFICULTIES OF A QUEEN-BREEDER.

It has been the settled policy of the proprietors of this journal to allow none but responsible people to place advertisements in its columns. There seems, however, to be a misunderstanding of what we mean by *responsible*. For example, we have a complaint now against an advertiser up for settlement which shows the difficulty we occasionally have to contend with in making advertisers and purchasers harmonize, even when both parties to the transaction are honest.

A, the buyer of a select breeding-queen

(price \$6.00), complain of B, the queen-breeder, because the queen died several months after her safe arrival and introduction. On this account the buyer demands his money back. B, the queen-breeder, says he can not do that, because he was not notified until months after the death of the queen; but to effect a compromise he offers to furnish a good queen in lieu of cash. The customer refuses this offer.

We think most people will absolve us from any responsibility in the matter, more particularly as we have gone to some trouble to get the dispute settled. We know the queen-breeder acts on the square-deal principle, and have a high respect for him accordingly. On the other hand, the buyer feels the loss of \$6.00 very keenly.

What complicates the situation still more is that we too had a complaint from the same buyer several years ago. He bought a breeding-queen from us which died a few days after receipt. We made the matter good by sending another queen in a nucleus, because we guessed either of two things had happened—the queen was injured in the mails or she was unsuccessfully introduced.

What we wish to point to buyers of queens, more especially breeding-queens heavy with eggs, is the very great desirability of having such queens sent in a nucleus by express. This reduces the risk to a minimum, and is more satisfactory in every way. Heavy queens can not stand the banging of the mail-bags; and middle-aged queens, or the queens old enough to have been well tested, can not stand the shocks of a mail-bag as well as very young queens.

We are of the opinion that none of our subscribers would expect us to do more than we have done in the foregoing case. We can not do wonders or impossibilities.

SENDING OUT TRAVEL-STAINED, BROKEN, AND NO. 2 HONEY AND LABEL- ING IT NO. 1.

THE illustration on page 358 shows a very conspicuous example of this very thing. We will explain by saying we received a carload of honey from a broker who bought what he supposed was No. 1; but much of it so graded was hardly No. 2. No, it would not even pass for that. It will have to be cut out and sold for chunk honey. The sections shown in the photo were taken out of the cases at random, and piled one on top of the other, and are a fair average of that one lot. Unfortunately the camera fails to show all the varying shades of travel-stain and bee-glue, but it gives one an idea and at the same time portrays very clearly where the honey was leaky and broken, with only a portion of the surface capped over. Notice, also, that this supposed No. 1 honey was of the non-separated kind. There are some bee-keepers who can produce good No. 1 stock without separators, but they are few and far between. The great bulk of such honey that we see at commission houses is inferior, and oftentimes a bad lot. The

sections are bulged, and when two bulged surfaces come together the results are always the same—both sections are ruined, and in most cases the whole case of honey is knocked down several cents per pound, even though the other sections are No. 1.

The samples shown in the photo do not by considerable represent the whole car of honey, but it was a fair sample of some of the so-called No. 1. I say *some* of this No. 1, because a good portion of it, having been produced by other bee-keepers, came up to the standard of the grade called for. But this particular lot of No. 1 (?) was produced, evidently, by some man who was not as ignorant of what he was doing as he might be. To state the plain facts, it is apparent that he *deliberately* put a lot of No. 2 and off-colored honey in the cases *knowing* they were such, and marked them No. 1. The broker, a large buyer, apparently took the whole lot without examination, and it was only when he sold it to us that he became aware of what had been palmed off on him. We at first refused to accept the car, and you can imagine the telegrams and letters that flew back and forth over this thing.

If there is any thing in this world that hurts the sale of good honey, and injures the honey business in general, it is the bee-keeper who resorts to such dishonest practices as this. We don't wonder that honey-buyers lose patience when they have to deal with such kind of trickery as this. It is not at all strange that some dealers quit handling honey at all.

Speaking about unseparated honey, we wish to register a most emphatic *protest against trying to get along without separators*. If there ever was a penny-wise-and-pound-foolish policy, this is it. In the photo here shown, five cents' worth of separators would have saved something like \$2.00 in the valuation of the honey. While the non-separator man did not lose on this one deal, he will have hard work to sell to that same broker again.

We feel so strongly on this subject, that, if the bee-keepers in any locality know of any one who is wrongly grading his honey, calling it No. 1 when it is not even No. 2, we should be glad to have somebody buy a case of it, take it to a photographer, and have a photo taken of it just as it is, showing every section. Send the photo to us; and if the bee-keeper is an old offender we shall publish his name to the bee-keeping world. Such a man ought to be run out of the ranks. He secures only a temporary advantage, but in the end injures himself and every one else.

Please do not get the impression that we are affirming that *no* one can produce good honey without separators; but we do say that the *average* man should not attempt it.

ALSIKE VERSUS RED CLOVER.

The following excerpt from the *Indiana Farmer* for Feb. 1 hits the nail on the head in a way that will be quite pleasing to the

bee-keepers of the red-clover States. It would be a good plan for bee-keepers to have this item printed in their local papers, as the facts are as stated, not being overdrawn in the least, nor untrue, and ought to be known by all farmers who now grow red clover. Most bee-keepers ought to sell alsike seed at cost, or even less than cost, to nearby farmers.

W. K. M.

Subscribers are asking us about alsike clover as a substitute for red, partly because of the high price of red-clover seed as compared with that of alsike, and partly because of the difficulty of securing a stand of red. The seed of alsike clover is only about half as large as that of red, and as the plant spreads more it should not be sown thick, so that only from 5 to 7 lbs. is required to the acre. The price of alsike just now is \$1.50 less per bushel than red, so that there is a saving of more than half in the seed required for a given area. Not many of our farmers have tried alsike, and we must take the testimony of those in other sections as to the plant. It differs from red in being good for four or five years when once set, and in allowing only one cutting in a season. Good moist clay soil suits it best; and as the stalks are long and rather slender it is well to sow a little orchard grass with it to give it support. The two plants mature at the same time, so there is no loss in cutting them together. Alsike is harder than red, and stands rougher winters without injury, and comes out all right where the other fails. Analysis shows that alsike contains more solid matter and protein than red clover. It is also an excellent honey-plant, yielding more and better honey than the other varieties of clover. It should be sown and treated as red clover, with a little more care in preparing the seed-bed. The ground should be pulverized as fine as possible.

KOLA FOR BEES.

A writer in *La Apicultura Espanola* advocates the addition of extract of kola to each quart of syrup fed to bees. He says it greatly increases the activity of the bees, apparently with no injurious effects. It is not clear to me what is to be gained by this, seeing that, when bees require to be fed, they do not require a stimulant but rather the reverse. I have known alcohol to have a stimulating effect on bees, but the results were unsatisfactory.

GERMAN MANUALS OF BEE-KEEPING.

I have received lately two excellent German works on bee-keeping, by Herr Max Kughenmüller, of Constance, Germany. The author is the editor of an excellent German bee-journal published at Stuttgart, the *Allgemeine Zeitung fuer Bienenzucht*, so that the works which are before me may be justly considered up to the times.

Both books are well bound, and well printed on excellent paper. The paper particularly is of the kind that lasts for hun-

dreds of years. The first one noted is "Die Bienenzucht," published by Sprösser & Nägele, of Stuttgart. I have not had the opportunity to read this book through; but it seems to me that, if any one desires to become quickly acquainted with German bee-keeping methods, reading this book carefully will do it. The European writers excel in what may be termed the science of the bee, and Herr Kughenmüller is no exception to this rule.

The other book is by the same authority, but published by Messrs. Richard C. Schmidt & Co., of Leipzig, who are well-known bee-publishers. Its full title is "Betriebsweisen lohnenden Bienenzucht." On its title-page it states that it is written by the practical for the practical; and this seems to be so, for each chapter is written by some successful bee-keeper from every part of Germany. For example, the first chapter was written by Pastor W. Stolzenburg, in Borgfeld, Prussia, and the last chapter is by the editor, Herr Kughenmüller, who lives in Constance, by the lake of that name in Southern Germany. There are articles from Schleswig-Holstein, Alsace, Pomerania, Hanover, Silesia, Gotha, Posen, Rhineland, Switzerland, Scherzingen-Munsterlingen, Austria, Baden, and elsewhere.

That interesting journal, *L'Abeille et sa Culture*, published at Huy, Belgium, signalized the new year by giving a sketch, with portrait, of Réaumur, the illustrious bee-keeper and savant. It says in part:

Reve-Antoine Ferchault de Réaumur was born at La Rochelle, France, Feb. 28, 1683. His name is generally remembered on account of his invention of the thermometer which bears his name. He became at an early age very proficient in mathematics, and published a work on the subject; but bee-keepers are chiefly concerned with his studies in bee culture. At the age of 55 he commenced the publication of a number of communications which he had originally read at meetings of the Academy of Sciences. These books treated on physics, natural history, and technology. He invented white porcelain for use in thermometers, and which is now much used for refrigerators. He also concerned himself with artificial incubation and the preservation of eggs. He was also interested in botany, and conceived a system of classification similar to the Linnean. In natural history he made a special study of the invertebrate animals, notably insects. Between 1734 and 1743 he published his great book, "Mémoires pour servir à l'Histoire des Insectes," in six volumes, which denoted sagacious observation, ingenuity, and patience. Of all the great naturalists of the 17th and 18th centuries he was certainly the most thorough in his methods. His "Histoire des Abeilles" (History of Bees) is second only to the work of Francis Huber in public estimation as a scientific treatise on bee study. He ceased his activities Oct. 17, 1757, after a long and very useful life.

COMB OR EXTRACTED HONEY, WHICH?

"Which had I better produce, comb or extracted honey?"

"Are you tired of comb-honey production, Mr. Smith?"

"Not if it pays as well as does the extracted. But from what I have been told, it would seem that the extracted should pay better. I read only yesterday in one of my old bee papers that extracted honey could be produced more cheaply than comb honey. The writer said there was a saving of 20 lbs. of honey which was required to build 1 lb. of comb in which to store the honey sold in the sections, and that, where the honey was extracted, combs once built could be used as long as the apiarist lived, barring accidents."

"Did you believe him?"

"I could not contradict, for I did not know enough to. He said Huber, who lived a century or more ago, experimented till he found that it took from 20 to 25 lbs. of honey (this to be eaten by the bees) before wax enough to produce a pound of comb could be secreted. Did you never hear of this?"

"Yes. This was a stock argument when the extractor was first known. But beekeepers of this time believe that it does not require nearly that much. In conducting his experiments, Huber confined the bees to the hive, which put them in an abnormal state, so that their struggle for liberty made them use very much of the honey Huber thought was used to produce wax. When bees are very active, and especially when they are uneasy under confinement, they use large quantities of honey to support the necessary vitality which is required all the while to take the place of that used up in the struggle to get out, very much on the principle that a man who is doing hard muscular labor requires much more food than does the one who sits at his desk all day."

"He said nothing about that; but he figured that extracted honey had the advantage because of the time taken to build the comb, when the comb-builders could just as well be in the field gathering nectar. Then he said further, that, since it takes about 1 lb. of wax to hold 25 lbs. of honey, if the yield in newly built combs in sections was 25 lbs., if I furnished the combs I would secure 50 lbs. of extracted, plus that gathered by the comb-builders, when they were not held in the hive for the production of wax and the building or shaping the same into comb. I have been thinking this over during the night; and it seems to me that, if he is anywhere near right, from 60 to 65 lbs. of extracted honey could be produced from the same colony of

bees as easily as could 25 lbs. of comb honey. What do you say?"

"It seems to me he was mixed just a little, although I do not know that I just understand that argument from beginning to end. He mentioned things which I never heard in an argument of that kind before. I am free to admit that it takes about 1 lb. of wax, when built into comb, to hold 25 pounds of honey; but I am not free to admit that the pound of wax costs 25 lbs. of honey to produce; nor am I willing to admit that there would be more gatherers where no combs were being built than would be the case where the bees were filling the section from starters; for it is a rare thing that the comb-builders go into the fields as laborers. It is possible to cause the bees which are generally occupied in comb-building to go into the field as gatherers by throwing the colony into an abnormal condition; but otherwise they would not gather stores whether they were building comb or not. You can very easily prove this for yourself by changing queens in a colony of black or hybrid bees about four weeks before the honey harvest, giving the colony a queen of the yellow race. Note the time the first yellow bees from the new queen begin to emerge from their cells; and twelve days later, when the harvest is at its height, take a look at the entrance of the hive during the forenoon, and you will see only black bees going out after and coming in with their loads of nectar. Now take a look in the sections, where comb-building is going on rapidly, and you will find nearly all the bees there at work, pulling away at the cells and septum to the combs of the yellow race; and if you wait till the sixteenth day you will find the same at the entrance, while there will be scarcely a black bee in the sections. This proves conclusively that the writer had no ground for arguing that 'the comb-builders could just as well be in the field gathering,' for the field-bees rarely build comb under normal circumstances."

"But, after all, don't you think that more extracted honey can be produced than section?"

"Yes. From all of my past experience I should say that, on an average, one-half more extracted honey can be produced from a given number of colonies than section. That is, if a given number of colonies would produce 50 pounds of section honey during a certain harvest, those same colonies would give a surplus of 75 pounds of good thoroughly ripened extracted honey. The reason I do not produce extracted honey for market is that, when it comes to the disposing of the two articles, I can sell nearly double the number of sections with the same labor that it takes to sell half as much extracted, and always secure a half more in price for the section honey, while during many seasons the section honey brings nearly double the price. I know that some claim to get as much for their extracted as for comb, in their home market, but I can not do this; and when it comes to sending the two to a distant market, all know that extracted brings

little more than half the price of section honey. The quotations in any of the bee papers will tell you that."

I agree with Mr. Doolittle most heartily, that there are some strains of very yellow bees, five-banded ones if you please, that are both hardy and good honey-gatherers.

A capital idea, that of cutting out light combs and placing them in a wooden butter-dish. One great difficulty with the honey trade is that it is not pushed as it should be.

In Dec. 1 issue of GLEANINGS Mr. Holtermann enumerates some of the causes of irascibility, and yet has left out one of the most important causes, as it seems to me. When bees are at work a heavy wind seems to make them very irritable, and sometimes human beings are affected in the same way. One day, without much wind, we may handle bees with the greatest pleasure; while the next, with a heavy wind, a good veil of the most approved pattern is very essential to our happiness.

Some of Mr. Coveyou's methods are novel, and seem to be of considerable value to those putting up honey, or bottling, as the government officials would have us say. I fear he would not be allowed our eastern roads for his tricycle, however. I am interested in the suggestion of an automobile for bee-keepers' use. Can you not, Mr. Editor, give us illustrations of the best up-to-date machines that will carry 1500 lbs., or thereabout? I believe a good practical automobile would save time enough so we could run an extra yard.

Although much may depend on the strain of bees or on the flow of honey, yet I believe that Mr. Morrison is not far out of the way in thinking that thin combs will be built more evenly than thick ones. I believe it a mistake that the standard sections are so thick. A comb, including the bee-space of not over $1\frac{1}{8}$ to $1\frac{1}{4}$, will not only be built more evenly, but I am satisfied that more of them will be completed; and then, too, they will sell to better advantage, as they are larger, or have more comb surface, and are more showy. They may also be cut to better advantage.

The experience of O. S. Rexford in feeding bees, page 1508, is not only interesting but of great value. How little we know for certain along these lines! One experiment

alone is insufficient. Here is an opportunity for our government experiment station to tell us just the best way to feed, and how much to feed, to supply a colony with the equivalent of, say, ten pounds of honey. This experiment would seem to show that, the quicker a colony can be fed, the less will be the loss. The best method of fall feeding is becoming a matter of a great deal of importance in those localities where there is little fall forage and the basswood has been cut off.

Right along this line is the cost in honey of wintering bees out of doors, by Allen Latham, p. 1563. I had the pleasure of meeting Mr. Latham in October, and am free to say that I believe him to be one of the most careful experimenters within our ranks, and yet his experience is so very different from my own that I am tempted to inquire what should make the difference. Some thirty years ago I wished to know the amount of honey required to winter a good colony out of doors. I took three good colonies; and the last of October or first of November, that there might be no mistake, shook off all the bees and weighed the combs. Again, about the first of April I shook and weighed the combs and found the average loss about 17 lbs. One lost almost exactly 17 lbs.; one $\frac{1}{2}$ lb. more, and the other $\frac{1}{2}$ less. Thus these three colonies averaged a loss of $3\frac{1}{2}$ lbs. a month—nearly double that of Mr. Latham's. What could make the difference? I can think of only two or three things. The first is, he is some two hundred miles further south, and, of course, the winters are somewhat milder. Again, his colonies may not have averaged as strong. They may have been of a more quiet strain of bees, which, as he says, makes quite a difference.

There is another thing I had thought of. Had his hives absorbed any considerable amount of moisture during the winter, thus showing a smaller loss than if the combs alone had been weighed? If this were very perceptible I believe he would have mentioned it. Doubtless the large entrances he uses had much to do with getting rid of surplus moisture.

If half of these colonies had had contracted entrances the result would have been instructive. My experience tallies with that of the editor, that a small entrance is a saving in honey and bees.

I purchased a yard of some forty colonies of bees in the spring of 1906, and found the winter entrance contracted to $\frac{1}{4}$ by 2 inches, and yet I believe I never saw a yard of bees average as strong as that one; and I believe this entrance, which is equivalent to $\frac{1}{4} \times 1$ is ample, provided it is given so as not to get clogged with bees, and provision is made to get rid of all surplus moisture.

Your experience, Mr. Editor, at Mr. Mendleson's, is certainly interesting, p. 1565. I was especially interested in the method of separating cappings from honey by heat. It

has for some time been a question how best to separate honey perfectly from cappings.

It may not generally be known that wax will melt at a temperature of 150 to 155°, while most honey will remain unharmed at a temperature of 160. Indeed, you can raise the temperature of clover honey to 170 for a little while without harm. A year ago we bought many hundreds of pounds of honey from a large dealer that had been broken or granulated. By placing it in a large tank with water-jacket the temperature rose to 160°, when the wax came to the top, and, after cooling, was easily separated from the honey. We have had occasion to buy more the past autumn, and treat in the same way, with equal success. Of course, the honey and wax must be stirred often so as to keep the temperature even through the mass.

The past summer at one of my yards, during my absence, quite an amount of honey and cappings came off together, which I found separated easily by means of the double boiler. Where a large amount of feeding is required in the fall I have found that a very good method is to take cappings after letting what honey drain out that will readily, keep them till we are ready to feed, then soak them out in water and use the rinsings for melting sugar in. Some use these rinsings for vinegar, but I prefer to use them for feeding.

Prospects in Texas are good.

The Southwest has enjoyed a mild winter.

An average of three frames with brood in January, and bees were in splendid condition.

The way we throw hives around, handling hundreds of colonies, nails to hold hive, tags will be driven into the wall of the hive-bodies in time. With the bent staples there is no trouble. See p. 139, Feb. 1.

Little cubes of honey, in paraffine wrappers, etc., to be served in hotels and dining-cars, is a good idea. It seems that the North will some time enter into the production of "chunk" honey yet.

Honey is a luxury for those who use it only occasionally and keep it in the house to place on the table just when visitors call. For those who know the true value of honey, especially its healthfulness as a food, and who use it on the table regularly, it is not a luxury but a necessity.

The tendency with too many bee-keepers is to let a great many things go to waste and continually buy anew, which costs money. More economy and less extravagance is what the American bee-keeper needs.

Contrary to the arguments of some of our authorities, I believe that hives well painted will last very much longer, keep in shape better, and look nicer than unpainted ones. These three points in favor of painted hives are enough to make me put a new coat of paint on all of my hives, supers, bottoms, covers, and all other supplies and implements this spring before the honey-flow.

NARROW VS. WIDE BOTTOM-BARS.

Wide bottom-bars with only $\frac{1}{4}$ -inch space between them would retard communication between stories very much. It is already detrimental with wide top-bars, leaving only $\frac{1}{4}$ -inch space between them. That's why my top-bars are $\frac{1}{4}$ inch wide and $\frac{1}{2}$ inch thick; and there are no more brace-combs than with wider ones in the same hive. The bottom-bars are only $\frac{1}{2}$ inch. It is easy to look up between the combs; and a great advantage is that all the queen-cells will be built right past these narrow bars from the lower edge of the combs of the upper story of the divisible brood-chamber. I say *all*; for those that will not be built there, if the combs are all solid slabs, are too few to mention. Where would the cells be with wide bottom-bars? and what would be the advantage of such width?

GLUCOSE OR "CORN SYRUP."

We have tried some of the stuff known as "corn syrup," hence are in position to side with those who are making such a vigorous protest against calling a thing such, which it is not. *Glucose* should be the name for it, for the people would then know what they buy. Of course, the bee-keepers will favor this. Now for my experiment: Taking a tumbler of honey and a similar one of "corn syrup" it will be found that it takes twice as much of the latter on bread "to get a taste," and then it does not give as much of a taste as half the amount of honey would. The syrup costs "only 50 cents for a ten-pound bucket, while honey is \$1.00;" but the consumer does not know that he must use more than two buckets of it to one of honey; and instead of getting the good that he would from honey he eats thrice the quantity of the injurious glucose stuff.

HOT AIR FOR LIQUEFYING HONEY.

It seems that the time will come when hot air will be used more for heating and reliquefying honey than the old method of placing the vessels in hot water. I stumbled across this idea quite a while ago. A 60-lb. can of granulated extracted honey was set on the brick wall surrounding a large boiler that was kept going night and day. On the following day all the honey had melted and was as thin as water. The can was at least

a foot away from the boiler, but nearly above it, where the heat was greater. Then, again, I have often set small vessels of honey quite close to the stove to have the contents melted, but it has been only lately that I have given it much thought.

While out at one of my neighbor bee-keeper's, Wald. C. Conrads, he spoke of an idea that seems good to me, but it will have to be put into practice before we can be certain whether it will work.

The idea is to have an apparatus very much like an incubator, but built on a larger scale. This "incubator" could be made large enough to hold six or eight 60-lb. cans of honey. The lamp arrangement would be the same as on egg-incubators, only large enough to give the required amount of heat. After putting the cans in the box the heat would be regulated to the proper temperature, and the register would keep it there. It would be necessary to leave the honey only long enough to be thoroughly heated to the required point, after which it could be replaced by a new lot of cans as quickly as possible, so the machine could go on with the same heat for days at a time. It would have to be ascertained at what point the temperature must be kept in the box to give the required results. It might have to be more than 100° Fahrenheit. The contents of the cans, *if these are left in the heat long enough*, would have the same temperature throughout; but for rapid work it might be best to put on more heat. In some instances a larger machine would be needed.

DIVISIBLE-BROOD-CHAMBER HIVES.

Among dozens of inquiries, one of interest to many who may contemplate giving this kind of hive a trial will be given herewith. It is as follows:

"I write to ask some questions about your shallow hives. I asked one editor why it would not do to use shallow supers with ordinary shallow frames—the advantage in this being that, if one did not like the divisible-brood-chamber system, he could go back to the deep brood-chamber without disposing of his shallow hives. The answer was, 'They would do in a way; but one objection would be that the top-bars of the frames would be too wide, and interfere with the operations.' I do not see the force of this objection. Is not the comb wider than the top-bar? and could one not order frames with narrower top-bars? Do you use the system that J. E. Hand outlined in GLEANINGS?"

My first divisible hives were nothing but the regular ten-frame shallow extracting-supers with 5½-in. Hoffman self-spacing frames. These were used throughout from the bottom up. My idea was exactly the same as the questioner's. If these shallow hives should prove unsatisfactory they were to be used as supers on the deep-brood-chamber hives, but this was never done. More were put in use as divisible-brood-chamber hives instead, until now I have hundreds of them in my apiaries. Having these side by side with both

eight and ten frame deep hives I can more readily notice their advantages.

And this is the very way I would urge others to give this kind of hive a trial before plunging into an expense that may be regretted later. There is nothing to lose in this way, as the bottoms and covers are the same as for ten-frame L. hives.

It is true that the top-bars of the regular frames are too wide for ready examination, and sometimes it is a hindrance in that it does not allow sufficient communication between stories in some colonies, keeping the queen from passing freely from one story to another. Nevertheless I have thousands of these frames in use with good results. My ideal frames have top-bars only ¾ inch wide the entire length, and ½ inch deep, the other parts of the frames being the same. I have used them for ten years, and there was no trouble with burr-combs or sagging; besides, these frames allow freer communication, better observation, and are stronger. There is no comb-guide or groove to weaken the top-bar, the foundation being fastened with hot wax.

My system of management is different from Mr. J. E. Hand's, in that it is not so complicated. It will be written up later.

SPRING MANAGEMENT.

Protecting Hives with Paper; Prevention of Mixing when Colonies are Set out of the Cellar; Feeding in the Spring; does it Pay?

BY E. D. TOWNSEND.

If I were wintering colonies in small hives with sealed covers, and had a well-protected location, I do not think it would pay me to paper the hives; but if I were using a hive larger than the ten-frame Langstroth I would paper in all cases, for I do not think that the large hive has as many bees in comparison to the size of the hive as the eight and ten frame hives have. If this is the case, the extra room to warm during the breeding season of spring would, in my estimation, justify the papering. If a yard of bees is located in a windy place (and I think the majority are) then it will also pay to paper.

COMPARATIVE ADVANTAGES OF BLACK AND WHITE PAPER.

It is with a good deal of satisfaction that I find GLEANINGS showing *white* paper for protecting colonies during winter and spring. Although I do not *winter* bees in papered hives I have been almost alone in the use of

white-felt building-paper for spring protection; and while the journals have been recommending tarred paper for spring protection I have been using the white with good results.

The reason that I have "steered clear" of black paper for papering hives is that, several years ago, I had experience with hives painted a dark color, some of which were of the chaff pattern, but built with a thin front painted a dark color. The results were that these dark-colored hives would absorb the sun heat so as to attract the bees out on many cold days, so that they rarely wintered a colony in good condition. They were, therefore, abandoned for a better kind.

Mr. S. D. Chapman, during the spring of 1906, wrapped every other hive in his home yard, consisting of over two hundred colonies, with tarred paper. By having half the colonies in the same apiary wrapped with paper and half not wrapped he was able to give the plan a very fair test. All of the colonies were wintered in a cellar, and Mr. Chapman is very particular to have all light colonies fed early in the fall for the purpose of having all the covers sealed down so there will be no chance for a draft through the hives after they are set out of the cellar in the spring. The location where this test was carried on is well protected from the prevailing winds, especially those from the north and west.

The ones that were covered with the tarred paper absorbed the heat from the sun to such an extent the bees were lured from the hives on days that were too cold for them to fly. This meant that the colonies in the papered hives at the beginning of the honey-flow in June were not nearly so far advanced as those in hives that were not protected. In view of this, Mr. Chapman has decided that no extra protection is needed if the yard is well sheltered from the winds, and if the hive-covers can be well sealed the previous fall.

White paper does not cause the hive to become so excessively hot when the sun shines as the black paper does; and if it has been well folded down and fastened at the bottom of the hive the bees are kept as warm as is necessary. Colonies so protected went through the severe freeze of May 10, 1906, without the loss of a particle of brood, while many colonies in hives not papered lost heavily, and some of these were so greatly reduced that they were able to gather no surplus honey that season. Generally speaking, night is the time when the extra protection is needed, for the air during the day is warm enough. Since white paper at night is just as good in all respects as the black, it is obvious that it is the better material to use, since it does not absorb the heat of the sun during the day and make the hive too hot.

I use white-felt building-paper, and it is so cheap that I throw it away and buy new each year. It is true that any sheets that might not be torn could be rolled up and saved; but the new paper folds so much better than the old stiff paper kept over from the year

before that I do not think it would be much of a saving to try to use the old. This white-felt paper comes in rolls 36 inches wide, and costs about 65 cts. a roll. One roll of paper this width will cover about 35 hives, and it is not hard to see that, if the paper is of any value at all, the expense of less than two cents per hive can not be considered. The tarred paper is usually but 32 inches wide. While this might do for an eight-frame hive it is not wide enough to suit me for the ten-frame size.

HOW TO WRAP THE HIVES.

If the hive-cover is sealed down I put the paper over the hive—cover and all; but if the cover has been loosened, or if there are any openings at the top of the hive, I remove the cover and put the paper next to the bees. The paper can be used more advantageously in this way, for it comes down to the bottom of the hive in better shape. Furthermore, it is easier to fold the paper around a hive that has no cover. The best arrangement of all is a hive with a thin super-cover that comes just flush with the outside all around. I remove the outer cover and fold the paper directly over the inner cover, being careful to put it on smooth, so that there are no wrinkles at the sides. I then fold over the ends in such a manner that the water can not possibly run down between the folds. I secure the bottom of the paper with a piece of lath as long as the side of the hive, and fasten it with a nail in the center. These pieces of lath should be tacked at the bottom of the paper, one on each side.

The lath have the advantage over the string in that the lower edge of the paper is held perfectly tight against the hive at all points, so there is no chance for a circulation of air between the paper and the hive. If nothing is used but a string tied around the bottom of the hive, there is likely to be a loose wrinkled edge where the wind and cold air can get in. If the work has been done well, there is no chance for the heat from the bees to escape except through the entrance of the hive. I believe this to be a very desirable condition.

We are wintering 325 colonies of bees in a cellar in Charlevoix Co. Nearly all of the covers are loosened so that there is some ventilation at the top.

The yard in which these colonies are placed in the summer is well protected; and when the hives are set on the summer stands the propolis is cleaned from the upper edge of the hive and from the under side of the cover. A sheet of felt paper the size of the outside of the hive is put on, held down by the cover. A ten-pound stone is finally placed on top; and it is my opinion that, since the soft paper fills up any small opening between the hive and the cover, there is no more chance for draft than in a hive with a sealed cover. However, in all our yards where the wind is likely to be strong the hives will be papered according to the plan given before.

REMOVING BEES FROM THE CELLAR.

In removing colonies from the cellar, no

attempt is made to set them on the stands they occupied the previous season; for I have found that it makes no difference as to the mixing of the bees whether the hives occupy the same stands year after year or not.

Unless precautions are taken, the bees will drift to one side of the yard when the hives are taken from the cellar, all of them trying, apparently, to enter a very few hives. This means that, in some cases, a hive will be deserted; and even the queen, thinking she is being left alone, will fly out and join the busy throng, trying to get into the few hives at one side of the yard. I have had this experience two or three times; and after the mixing is started I have found that it pays to contract the entrances of the strong colonies so that only a few bees can emerge at a time. When this is done the flying forces of all the colonies are more nearly equalized. After this the colonies should be shifted about to some extent; that is, if a certain hive already has its share of bees, and if more bees keep coming to it so that the prospects are that it will become overcrowded, it should be carried to some part of the yard where the hives are not getting their share. One of the hives light in bees is set in the place occupied by the strong colony. This should be kept up until all the colonies are as near alike in regard to strength as it is possible to get them. After finishing such work, however, it is generally found that the plan is not very satisfactory; hence it is well to prevent such drifting on the part of the bees in the future.

HOW TO PREVENT DRIFTING.

In order to prevent this state of affairs it is necessary, first, to understand what causes the trouble. Improper methods in wintering account for some of it; for, if the bees are "just dying" for a fly, they are more likely to boil out of the hives without carefully marking their locations. This, of course, means a general mix-up.

Removing the colonies from the cellar on a very warm day also tends to cause drifting. The disturbance and the warm air together cause the bees to leave the hives in such numbers that they are almost demoralized. A large entrance is detrimental in this case, for it allows the bees to leave the hives too rapidly, so that, in a short space of time, the air is almost full of lost bees. A high wind aggravates matters, for this surging mass of lost bees may be blown to one side of the yard. It would seem that the leeward side of the yard (the side toward which the wind blows) would get the greatest number of bees; but such is not the case. I have found that the windward side gets the bees—that is, the side toward the wind.

Hubbard Bros., of Boyne Falls, Mich., had a peculiar case of drifting last spring. Their yard is located on a ridge, one side of which slopes to the east and the other to the west. The hives were set out of the cellar in the night, and in the morning the sun shone brightly and the bees on the east side were attracted out by the morning sun, and were flying strongly before those on the west side

even started to fly. The result was that the bees from the west side were so attracted by the great commotion on the east side that a good share of them went over and mingled with the flying throng so that there were finally entirely too many bees on the side of the yard which got the sunlight first, while the other side had but a few. It seems to me that in such a case I would try shading the east side until the sun is high enough to shine on all the hives at once; and then when the bees have begun to fly to some extent the shadeboards, or whatever had been used for shade, could be removed. In this way it seems to me the flying of the bees could be regulated, especially if the precaution is taken to contract the entrance down to about $\frac{1}{2}$ inches.

It must be borne in mind that the bees from the strong colonies are the ones that make the great demonstration at the entrance, so that bees from other weak colonies are attracted to them. I know of no better way to regulate this than to contract the entrances of the strong colonies as explained above. This means that the bees from such hives can not fly any faster than those from the weaker ones, so that all are flying with about the same force.

If the hives are removed from the cellar in the early part of the season, before the weather gets too warm, there will be less mixing on the part of the bees when they fly for the first time. This is a good point in favor of removing the bees earlier, for such mixing is quite a serious matter to the honey-producer.

THE BEST TIME TO REMOVE COLONIES FROM THE CELLAR.

Whenever the indications are that the next day will be a suitable one for the bees to fly I go to one of the clamps and remove all but about two inches of dirt from the straw that covers the hives. This is left on so that the bees will not try to fly before they are finally uncovered. In the evening, after it is so late that bees would not try to fly from the pits, I remove the rest of the dirt and the straw. When this is done, there is quite a demonstration among the bees on account of the fresh air which reaches them; but, since it is now so dark that they can not fly, there is no mixing. By morning the bees will have quieted down, since the nights are usually cool at this time of the year. As soon as it is light in the morning I quietly place the hives on the permanent stands, and hardly a bee will come out. By this time they are so used to the fresh air that they usually fly very moderately, and rarely get mixed up. An ideal day for the first fly would be one when the air is warm but the sky hazy. With these conditions the flying is very moderate and there is no mixing.

Any colonies that are light in stores are placed in a row by themselves near the honey-house. This saves a good deal of work, and such weak colonies are not so likely to be forgotten as if they were placed in some remote corner of the yard, for they may be seen every time the honey-house is entered.

On this account they get better care than if they are scattered all over the yard.

STIMULATIVE FEEDING DURING THE SPRING NOT ADVISED.

For some reason, here in Michigan there do not seem to be many who practice spring feeding for stimulating. I can not say whether this is on account of the bad weather in the spring, which makes it difficult to get bees to take the feed when they need it most, or whether experience has taught the bee-keepers of this locality that a colony with brood-nest made rich with honey the previous fall is in better condition. All indications point to the latter cause.

There is one bee-keeper, however, Mr. E. E. Coveyou, of Petoskey, who thinks it pays him well to feed for stimulative purposes during the spring. I will let him tell his experience in his own words. He says:

"After the weather in the spring is settled, and the bees have begun brood-rearing long enough so that young bees are hatching, I aim to keep them breeding as fast as possible. Lest the weather should turn cold, or a frost come as it did last spring, I proceed to feed every colony at once. My experience last spring was quite serious. In one apiary 131 colonies that were fed continuously before and after the frost gave an average of 87 lbs. of honey to the colony. Another apiary, six miles from Petoskey, of 118 colonies, was not fed, although it was otherwise in just as good condition, for each colony had a good deal of brood started before the frost. I went to this apiary about a week after the frost, and, to my sorrow, I found that the bees had dragged out the drones, and the conditions seemed to be more like those in September. This was when the raspberries were just coming into bloom. The yield from this apiary was 30 lbs. of surplus per colony; and if there was any difference in the two locations, this last apiary had the better one. I am sure that I could have obtained 4000 lbs. more honey from this yard if the bees had been fed 500 to 1000 lbs. of sugar syrup in the spring."

Remus, Mich.

SPRING MANAGEMENT.

Building Up Colonies for the Honey-flow; a Unique Scheme of Exchanging Brood between Weak and Strong Colonies.

BY OREL L. HERSHISER.

[Mr. Hershiser states in a letter that in this article he assumes two apiaries which are on an equality in every respect in the spring, the locality also being the same, in order to explain more clearly his plan, and to show the difference that would result from special care over that where no special care is given. The average bee-keeper will be able to make such modifications of the plan as his particular case requires.]

Mr. Hershiser thinks that this has been the most effective plan for building up weak colonies and bringing the maximum of workers into the hives that he has ever tried. He has had some experience with the Alexander plan of placing a weak colony over a strong one, but has finally adopted his own plan in preference. Mr. Alexander has twice as much time and twice as much good weather after the 20th of June, so

it is easier for the colony below, in his plan, to keep the extra amount of room warm enough for both queens to lay to their full capacity; and since he has until August to accomplish the desired result a little delay in the spring is not important. The Hershiser plan, on the other hand, contemplates getting all the queens to laying to their full capacity from the time manipulations are begun in early spring.—Ed.]

Shall we have workers according to the harvest when it is ready? An affirmative answer to that question may mean a full and abundant harvest. A good growing season, and weather conditions favorable for the abundant secretion of nectar, will afford only a partial harvest, ranging from something less than a full crop to little more than nothing, according to the condition of the colonies, if they contain less than a full complement of workers. Let us not answer the question in the negative, but turn our attention to how we may with greatest effect build up the colonies to overflowing with workers for the honey harvest.

The great need of skill in handling the bees that survive is strongly emphasized when we remember the heavy winter and spring losses that recur so frequently, notwithstanding all the pains bestowed in fall preparation. Every spring finds many bee-keepers, even among the most careful and experienced specialists, with not only heavy losses, but with a large proportion of the colonies that have survived, in weak condition. However, let no bee-keeper be dismayed by heavy losses, but, rather, let him study how best to prevent them in the future. If the losses are heavy, above all let him make the most of the survivors, remembering, as many bee-keepers of long experience have observed, that a bountiful honey-flow nearly always follows a severe winter and spring.

Occasionally bees winter so well that there is little or nothing to do with them to better their condition; but more often every apiary of considerable size will come through the winter with the surviving colonies ranging all the way from very strong to very weak, and this condition exists whether the bees are wintered in the cellar or on the summer stand. Without some special care and manipulation, these weak colonies are of little or no service to their owner. Especially is this true of those apiarists whose main source of honey is clover or basswood, or both, as weak colonies have but a short time to build up and get in condition so early in the summer; but even apiaries so circumstanced may be made to yield a handsome profit, if skillfully managed, which otherwise, if there is a preponderance of weak colonies, would gather hardly enough honey for the following winter's stores.

On the first warm day of spring the apiary should be looked over with a view of supplying food to all colonies that are short, but they should not be disturbed except to supply such needs. I do not regard early stimulative feeding as desirable except, perhaps, to get one or two strong colonies in condition for early queen-rearing. All entrances should be contracted to small proportions—for example, what would amount

to one-half inch square to $\frac{3}{4} \times 2$ inches. If packed for outside wintering the packing should not be removed until settled warm weather. If severe cold weather follows the setting of the bees out of the cellar the entrance to the hives should be contracted to a fly-space for only two or three bees; and if the hives have a flat cover an additional flat board laid on the cover will help greatly in conserving the heat of the colony. Tar-paper wrapping of the hive is recommended by a few specialists whose success in honey production gives great weight to their opinions. I have not had occasion to try it. The gist of the whole matter of early spring management is to keep the colonies warm and dry; and, having seen that they have plenty of stores, let them alone until settled warm weather.

It is a waste of time to attempt to unite weak colonies early in the spring. Usually the uniting of several weak colonies will result in one colony no stronger than if it had been left undisturbed by the addition of other bees.

When settled warm weather has come, and all danger of spring dwindling has passed, it is time to get busy with active preparation of the colonies for the harvest. Generally speaking this season is about apple-blossom time in the northern and eastern States and the southern Canadian provinces.

There are several methods of building up colonies, in anticipation of the honey-flow, employed by specialists; but I purpose describing only the one that has given the best results in my own experience. For the purpose of more clearly illustrating this method let us suppose a good-sized apiary, one hundred colonies of which have come safely through the spring-dwindling period after a severe winter and spring. Upon examination we find that of these hundred colonies twenty-five are strong, and bid fair to be running over with bees by the commencement of the main honey-flow (white clover), which will open in five or six weeks, and be in its height a week thereafter. Of the seventy-five remaining colonies, fifty are in medium condition, with from three to four L. combs fairly well filled with brood, and twenty-five colonies are weak with from two to three L. frames containing brood. Assume that it will be a good honey season and a good location, and that the twenty-five strong colonies will, without manipulation, other than supplying the needed supers, store an average of 100 lbs. of surplus honey, or a total of 2500 lbs., and that each will cast one swarm which will gather winter stores, any surplus from swarms being credited to the parent colonies; that the fifty colonies in medium condition will gather enough honey on the average for winter stores but no surplus, the assumption being that there is no fall flow, and that none of these will swarm, and that the twenty-five weak colonies will rear enough bees and store enough honey during the season to make eight good colonies ready for winter when doubled up in the fall. From this assumption the net re-

turns, not counting labor or expenses, would be 2500 lbs. of honey and an increase of eight colonies, or 108 colonies fall count. At the close of the season the possibilities of this apiary, if it had been in the pink of condition for the honey-flow, is plainly pointed out. Instead of a net crop of 2500 lbs., not counting labor or expense, and an increase of eight colonies, there would have been nearly or quite 10,000 lbs. of honey, and a liberal increase amounting to approximately 100 per cent, or, instead of the increase, a corresponding increase in the amount of surplus honey, all of which is evidenced by what the 25 strong colonies accomplished. The apiary has yielded less than one-fourth of its latent possibilities. That is not enough for the progressive bee-keeper. Let us, then, diligently inquire how we could have made those seventy-five profitless colonies yield at least a fair profit.

It is well known that the egg-laying capacity of the queen is not necessarily impaired by reason of the colony having dwindled to small proportions. A young vigorous queen in a dwindled colony has as much of latent value stored up in her as her equal in a populous colony, and she is willing and anxious to yield it up; but to do so she must have the proper environment. Dwindling is probably due to a variety of causes other than low vitality of the bees, and the progeny of the queens of dwindled colonies are as likely to be extra vigorous honey-gatherers as otherwise. In fact, dwindling may be the result, in some cases, of so much vigor in the bees that they venture out for water and nectar in weather so cold as to cause their destruction. Populous colonies of such bees are the ones that roll up a bountiful surplus if it is to be had. The importance of getting as many as possible of the progeny of such queens into the honey harvest is, therefore, apparent. It is equally clear that, for lack of warmth, a weak colony is incapable of incubating many of the eggs the queen might lay, or of nurturing the young bees. If we can so manipulate our colonies as to secure the maximum of egg-laying of all our queens at the season which will put the largest possible force of vigorous workers into the harvest, it is plain that we shall be far and away ahead for our pains in the amount of honey secured by the close of the season.

HOW TO EQUALIZE WITHOUT WEAKENING THE STRONG COLONIES.

Let us classify the colonies comprising the apiary in the above illustration into three groups, placing the twenty-five strong colonies in the first, the fifty of medium strength in the second, and the remaining twenty-five weak colonies in the third class. This classification is made without changing the position of the colonies in the apiary, and is made when settled warm weather arrives and spring dwindling has ceased. Now go to one of the weak colonies and select the two combs containing eggs and brood, and shake the bees clean therefrom into their own hive, leaving no brood unless it be a

comb from which the young bees are emerging in considerable numbers. Then go to one of the strong colonies and select as many combs well filled with capped and hatching brood as were taken from the weak colony, and replace them with the combs taken from the latter. Shake most of the bees from these combs of hatching brood into their own hive, being sure not to take their queen. Give one of these combs to the weak colony from which the combs of eggs and larvæ have been taken; and if it has bees enough to care for both of them they may be given; otherwise one of these combs of hatching brood may be used in another of the colonies of the third class. All the colonies of the third class should be thus supplied with combs of hatching brood from the colonies of the first class; and the poorly filled combs of eggs and brood from the colonies of the third class should be given to the colonies of the first class in exchange. This manipulation will result in a rapid increase of bees to all colonies in the third class. As the young bees emerge the queen will occupy the cells with eggs, and the addition of so many young bees emerging from the full combs of capped brood that have been supplied will create heat enough to induce the queen to fill one or two additional combs with eggs as fast as her capacity for reproduction will admit. Having commenced these manipulations from four to six weeks prior to the opening of the main honey-flow the efficiency for honey-gathering of the colonies of the first class has been very little, if any, impaired, as the queens in these populous colonies will immediately occupy the remaining cells in these exchanged combs with eggs which will develop into field bees in time to be of the greatest use in the forthcoming honey-flow. Swarming will undoubtedly be retarded in the strong colonies as a result of the curtailment of young bees at this time; but, if delayed or defeated, it will result in enough more honey to amount to a full compensation. A swarm thus retarded will be enough larger and better to be well worth having when it does finally issue.

Buffalo, N. Y.

Continued.

[The plan here outlined in the last paragraph we consider excellent, and we are sure it will work. The special feature of it is that it allows all queens to lay to almost their full capacity, whether they have strong colonies or not.—ED.]

SPRING PROTECTION.

Paper Winter Cases.

BY N. E. FRANCE.

In the Northern States spring protection is of great importance. With eleven years of early spring inspection of bees in Wisconsin I find that the general causes of weak colonies are old queens, shortage of honey, and unprotected hives. Quite often in one

neighborhood I find one apiary in which nearly every colony is weak and several dead, while quite near will be another apiary with strong colonies. I at once seek the cause. I always want young queens from strong colonies in early fall (August) so as to get my hives filled late in the fall with young bees. Young queens in early spring also begin brood-rearing earlier, and have plenty of young bees to take the place of the old bees fast dying with age. As for fall feeding, my old statement is still good—a little too much *winter stores will be all right in the spring*. Every time I find strong colonies in the spring, plenty of stores are in the hives. "More in the feed than in the breed" is true.

I am surprised that in the cold climates where we wear overcoats many take the bees from the cellar in a tender condition, and do not place an overcoat of building-paper or an outer case around the hive until settled warm weather. In many places while inspecting apiaries in the spring I have asked the owner to wrap half the hives with black building-paper and see for himself the results. *In every case it has convinced the owner that the sudden changes of spring weather did not affect the colonies in protected hives, while the others continued to dwindle and die.* I always want an apiary in a location protected from the high winds.

If spring feeding must be done, sealed combs of good honey with cappings partly scraped off, and placed next to the cluster of bees, give satisfaction. Warm liquid honey or sugar syrup makes good spring feed if needed; but I prefer my spring feeding in the fall.

SPRING MANAGEMENT.

Preparing Supers; How to Put Starters in Sections.

BY DR. C. C. MILLER.

I want to say some words especially for producers of comb honey with not much experience.

In starting out in producing honey it will very likely occur to you, without my suggesting it, that you should feel your way somewhat carefully, economizing wherever it is possible. You can economize in the matter of foundation. Instead of filling the section you can use triangular starters coming half way down, and the expense will be only one-fourth as much. Instead of using super-springs you can save expense by using wooden wedges costing almost nothing. You can get along with only two supers—yes, you might save by having only one super for each colony, emptying out the finished sections and filling again as often as needed. By waiting until the honey-flow is on before getting any sections ready, you can tell better how many sections you will need, and save the expense of having a lot of su-

pers filled with sections lying over till the next year, or may be longer.

With regard to practicing all that kind of economy, I have a single word of advice—*don't*.

Let us take the last item first. I can't take the time to give you all the reasons for it, but I advise that you get ready, before bees fly, all the supers of sections you will get ready for that year. One of the reasons for it is that you will not then be caught with a heavy flow of honey, no dish ready to catch it, and a lot of honey lost while you send off to the supply-dealer for the dish.

How many supers of sections shall you have ready in advance? In the first place you should have for each colony one superful of sections that you deliberately count on as not to be filled at all *that* season; for toward the close of the season there will come a time when you think no more room will be needed, and yet there is a possibility that some colonies may need it. You don't know just which they are, and the safe way is to give the extra room to all. Given on top, the bees will do little or nothing with it if they don't need it; and if you take it off as soon as the bees stop storing, it will be all right for a future harvest. Besides that extra super you must have enough ready, not for an average season, but for the biggest season that may occur. If you can find out that in the past the biggest season that ever happened yielded an average of five supers per colony, then you must have ready five supers and one extra, or six supers in all for each colony.

"That's a lot of expense every year for nothing?" Look here. Every year for many a year I've had my house insured against fire, and have paid out a lot of money for nothing, for my house never burned down. I expect to keep on paying, and I don't expect my house to burn down; but if it should—see the point? Same way about insuring against loss by not being ready for that big year.

Let me earnestly advise that you invest in at least one super-spring for each super. With a wooden wedge you can make the sections crowd up tight, perhaps even tighter than with springs, but they'll not stay so. The sections will shrink, and then they'll be loose unless you have springs that will follow up and keep crowding in spite of the shrinking.

Just as earnestly—yes, a little more earnestly—I want to advise that you do not make the mistake of trying to economize on foundation. You know it is generally believed that 50 per cent more extracted honey than comb can be obtained—some claim two or three times as much. That's because the bees are saved the labor of building comb for the extracted. Well, don't you see that at least part of that labor is saved by having full sheets of foundation? and so the crop ought to be increased by that much.

Another thing: The chief secret of preventing brood in sections is to have them filled full of *worker* foundation. If only a small

starter is used, the bees are pretty sure to build some drone comb in the vacancy, and then the queen will come up for the sake of laying in the drone-cells. With full foundation in sections it is so rare a thing for the queen to come up that I never think of having an excluder under sections.

A very important item in this connection is the manner in which the section is filled with foundation. Let the starter reach clear down to the bottom-bar, and when warmed up by the bees it will bag and buckle. To avoid that, the starter must fall a little short of reaching the bottom. There will then be no buckling, but another trouble arises. In too many cases the bees, instead of fastening the foundation to the bottom-bar of the section, will gnaw away a passage beneath it, making an unsightly section and one not safe for shipment. The case is aggravated by the fact that, when there is a space below, there is likely to be more or less space at the sides.

Some have fastened the foundation on all four sides with satisfactory results, but others who have tried it say that the foundation still bags, as reported especially by E. F. Atwater.

To solve the problem of having the comb well built down to the bottom, and at the same time to have no bagging, the vacancy to allow for stretching must be, not clear down at the bottom, but a little higher up. This is accomplished by having the starter in two parts, the bottom starter standing up about $\frac{5}{8}$ inch, and the top starter coming down within $\frac{1}{8}$ inch or so of the bottom starter. With such starters coming within about $\frac{1}{8}$ inch of the wood at the sides, I have had no trouble in getting tons of sections beautifully built out on all four sides. Even if the sections are not to be shipped, the increased beauty of appearance pays well for the little extra time required to put in the two starters; for it requires no more foundation than for a single starter reaching down nearly to the wood.

To those who have never tried it I can hardly commend too highly the use of the bottom starter.

Marengo, Ill.

HONEY AS A FOOD.

The Prairie Farmer publishes the following:

Late investigations lead to the belief that honey, the earliest form of sugar that human beings could obtain, is still about the best. It is counted, as the result of these experiments, among the most nutritious and delicate of foods. Not only does honey seem to act as a cure for diseases of the throat, but as a somewhat remarkable purifier of the blood. The only obstacle in the way of its more general use appears to be that many people can not eat it without stomachic pain.

We wonder where the editor of the *Prairie Farmer* obtained the idea that honey causes stomachic pain. To those who are not used to it, honey tastes so well that they are induced to eat too much of it when the chance is given them. It is unfair to blame the honey for this indiscretion, however. Please place the blame where it belongs.

E. FRANCE.

Trapper, Naturalist, Bee-keeper, and Fruit-grower.

BY E. R. ROOT.

Mr. Edwin France, father of N. E. France, General Manager of the National Bee-keepers' Association, passed away on the morning of Feb. 7, at the ripe age of 84 years. But the senior France was not illustrious simply because of his illustrious son, but for what he has done himself. He produced, during the 80's, some immense crops of honey, and at one time he was regarded as one of the most successful bee-keepers in Wisconsin. Beginning in 1880, and all during that decade, and till 1895, he was a fre-

E. FRANCE.

quent and valued contributor to these columns. He began his writing about the time the present editor began to take charge of this journal. Looking back over these 25 years and more, I take just a little pride in having "discovered," as I believe, a real and original genius—one whose articles fairly bristled with practicalities, for whatever he undertook paid.

While not an educated man, it was very evident that E. France was a wonderful student of nature. Incidentally I learned that, through his early experiences as a trapper, he came in close contact with animal life, especially that in its wild state; and when it came to knowing bee nature he was one of the best-posted men in our ranks. He was

indeed a very keen and close observer—a man who could see not only beauties in nature, but turn his knowledge to a practical account. He made money, not only with bees, but in growing fruit and in farming, and, what was more, he had a faculty of telling others how to do it. No wonder that the junior France, under the tutelage of such a father, has been so useful a man to the bee-keeping interests at large. To be really *useful* means far more nowadays than to be only great. The world, though somewhat tardily, is beginning to see this.

The senior France really began bee-keeping about the year 1870; but he had had considerable experience some years before that. Starting with 123 colonies in 1871 we find him making a gradual increase until 1886, when with 395 colonies he took nearly 43,000 lbs. of honey, increasing to 507 colonies. While he had some reverses he seemed to have a faculty of keeping up these remarkable yields for a number of years. But during these days he had the support of a son who seems to combine all the qualities of his father, and who, in later years, assumed charge of the bee business of E. France & Son.

The senior France was a believer in large hives and strong colonies. Starting with a very deep frame he finally settled upon the Langstroth, adopting what is known as the France quadruple tenement hive. This contains four powerful colonies, the same being wintered outdoors, for the hive is double-walled. His honey-extractor (for he produced only extracted) was of the non-reversible type; and with this simple machine it was remarkable the amount of honey he could take in a day.

I said that Mr. France was a naturalist, and so he was; and being one of the pioneers he trapped and hunted during the winter, at which times he endured all kinds of hardships, many and many a time the Indians camping on his trail. The stories he could and did tell of wolves and wolf-hunts would doubtless interest many of our boy readers, for he knew wolf nature as very few men do. Too bad that some of his experiences in his early life could not have been put in book form. I can imagine that, during his declining years, he must have smiled broadly at some of the nonsense written by nature-fakirs, especially when they attempt to tell some of the wonderful performances of bears and wolves.

But if I were to attempt to give a complete life-history of the elder France I would also have to write a biography of his son, N. E. France, for their lives were very closely interlinked. But our older readers, at least, I assume, are familiar with the fact that the junior France is not only the General Manager of the National Bee-keepers' Association, but foul-brood inspector for Wisconsin, president of the Wisconsin Bee-keepers' Association, and lecturer at farmers' institutes. The fact that he has served in these various capacities for so many years is ample proof of the appreciation in which he is held. Indeed, his genius and ability have not only

been recognized in his own State of Wisconsin, but he is known and respected by the two or three thousand members of the National Bee-keepers' Association.

The senior France has been in failing health for a number of years. He had a fall last October from which he never fully recovered, and which was really the immediate cause of his death. During the time of the last meeting of the National at Harrisburg, Mr. N. E. France felt that he would not be able to leave his father; but the latter, I understand, urged him to go, which he did. It must have been a comfort to the old father in his last days to learn of the sincere appreciation in which his son is held by the members of the National, as was shown at the Harrisburg convention.

HENRY ALLEY.

BY W. K. MORRISON.

The readers of GLEANINGS have already been informed of the death of the veteran queen-breeder whose name is inscribed above. The Salem, Mass., *Evening News* of Feb. 11 thus alludes to the event:

Henry Alley, one of the best-known and most respected citizens of this town, died at his home on Larch Row last night, aged 72 years, after a brief illness of heart trouble.

He was born in Newburyport, but had lived in this town practically all his life. He was long active in town affairs, and was frequently heard at town meetings. He had served as a police officer, on the board of health, and as cattle-inspector for many years. He was an ardent Republican, and had long been a member of the town committee.

Mr. Alley was known all over the county as an expert in bee culture, and had edited many standard works on that topic. His queen-bees and a patented appliance for handling bees were sent all over the world. For the last five years he had done a big business in curing hams, he having devised a process which won him much fame in this line.

Thus disappears from view one of the early lights of American apiculture, the last of a brilliant galaxy which included such names as Langstroth, Quinby, Gallup, Hetherington, Wagner, Grimm, King, Cary, and Mrs. Tupper. He was the pioneer in scientific queen-rearing, and did much to place America far in advance of all other countries in bee-breeding—a lead which it still maintains.

Of course he had the advantage of being first in the field; but this does not detract in the least from his reputation, for he had to blaze out his path alone and unaided. To his credit be it said he was one of the first to appreciate the supreme value of Langstroth's invention, and always vigorously defended him when others attempted to lay claim to the rights of the father of American apiculture. Mr. Alley was no mean inventor himself, for, besides inventing and devising a system of queen-breeding, he also invented the Bay State hive, Alley's drone and queen trap, Alley's nursery cage, and baby-nuclei hives.

It may be well to state that here in Medina, after faithfully trying all sorts of devices, the queen-breeders of The A. I. Root Co. have returned to a modification of Alley's

baby nuclei as somewhat superior to any other. They have also returned to the use of Alley's nursery cage and nursery frame, and that, too, after experimenting with and using many similar devices.

It may be well to say something right here about Mr. Alley's system of queen-breeding. He never practiced "grafting," but, on the contrary, held it was very injurious to the young queen. One reason he gave was that handling so delicate a creature with an ear-spoon is hurtful; also that it is treated as a worker for two or three days, and for that reason is stunted for want of royal jelly at a critical time.

He claimed for his larvæ that they were

HENRY ALLEY.

fed royal jelly immediately they hatched from the egg. He laid special stress on this point; but it must be admitted that very fine queens are also reared by the grafting process which is now so popular. It is, however, only fair to say that some of the very best queens ever used here at the Home of the Honey-bees were purchased from Mr. Alley, and it is well known his queens were uniformly good.

One of his pupils was Mr. E. L. Pratt, better known as Swarthmore, whose system of queen-raising is based on that of Alley's.

As already intimated, he commenced bee-keeping very soon after Langstroth's hive appeared, and very soon thereafter proceeded to contribute to the pages of the *American Bee Journal*. He was severe on what

he thought was wrong, and for that reason made some enemies; but he was not resentful himself when others criticised him.

In 1883 was published "The Bee-keeper's Handy Book," by Henry Alley, wherein he gave the world the benefit of his 27 years' experience, of which 24 had been as a specialist in queen-breeding. This work was well received, and 2000 copies were sold within a year and a half. Much of it is taken up with his method of rearing queens. This, being well illustrated and clearly described, enhanced his reputation as an expert bee-breeder.

As is well known, he reared his queens from the egg by cutting a comb containing eggs into narrow strips (about three cells wide). A certain number of the eggs were (or are) destroyed with a match-stick, so that those which are left may have ample room to allow of the construction of a queen-cell. When the strip has been duly prepared, the under side of it is dipped into melted wax, and by this means it is attached to the lower edge of a comb which has been built half way to the bottom-bar. The bees seeing the cells arranged mouth downward, and every thing so handy, proceed to build queen-cells around each egg; and as they are absolutely queenless, yet strong in numbers, they seldom fail to rear a large proportion into good queens. It is true that the various operations require a lightness of touch and a delicacy of treatment which some are incapable of; but Mr Alley always maintained that such people ought not to attempt to rear queens.

In 1883 Mr. Silas M. Locke, of Salem, Mass., one of Mr. Alley's students, started his sprightly bee journal, *The American Apiculturist*, and in this paper the subject of our sketch had the opportunity to state his views freely. It was one of the best bee-papers ever started in this country; but, most unfortunately, Mr. Locke died just as the journal had succeeded in fully demonstrating its usefulness. Mr. Alley then put on the editor's harness; but journalism was not his forte, and the paper died a natural death in 1894.

From time to time Mr. Alley issued his book on queen-rearing, which consisted of a part of his "Handy Book," adding little improvements and inventions which he had made in the interim. He also kept up his queen-breeding operations to the last, having established a reputation for the high quality of his queens.

One of his last acts was to write (Jan. 24) a personal letter to Mr. E. R. Root, in which he expressed his appreciation of GLEANINGS in this wise:

"Had I been well I surely would have sent you some strong praise of the several late copies of GLEANINGS. You have outdone even yourselves. No magazine or publication I have seen comes up to the beauty, both outside and in, of any copy of GLEANINGS."

Peace to his ashes. He was a great bee-keeper.

STORM-DOORS.

Bees Flying Out on Bright Days and Dying on the Snow.

BY E. R. ROOT.

On page 96 of our issue for Jan. 15, in a footnote to the article by C. H. W. Weber I referred to storm-doors, so to speak, that we had placed on all of our outdoor hives, embodying a principle suggested to us by Mr. A. J. Halter, of Akron. It will be remembered that he has been using them for over two seasons, and believes them to be not only a saver of bee-life, but a protection from piercing winds which might otherwise blow directly into the entrances, thus chilling the colony.

As we are now approaching spring, a further report on these storm-doors ought to be made. We had been having a very cold spell of weather, for us, during which there had been a heavy fall of snow. On the 10th and 11th the weather moderated very decidedly. There was a clear sky, and the sun shone with a brilliancy that we do not often see in February. The hives had storm-doors *a la* Halter over all entrances, and I was curious to know just what the effect of these might be in keeping the bees in. The atmosphere was balmy from 10 to 2 o'clock on both days; but there was such a large amount of snow I was certain that any bees that lodged thereon would never return to their hives. The storm-doors, because they kept out the sun, had the effect of keeping the bees in the hive till about the middle of the day; but as the atmosphere warmed up it percolated through the entrances to the colonies. The bees, allured by the warmth, but not by the light, came out. The air was full of them; and the way they clustered over the hives was alarming. I did not fear so much for those that lodged on wooden objects or on bare ground as I did those that fell directly on the snow. These, I was sure, would never get back, and they did not. But those on the hives and on ground where there was no snow, after resting for a few moments, would take wing and return to the hive.

In order to give the reader an idea of what was prevailing in our yard among the hives I am reproducing here a number of photos which I took on the occasion. Fig. 1 shows one of our regular double-walled chaff hives, over the entrance of which was leaning a so-called storm-door. Just notice how the bees were clustered over the hive and on top of it! They had discovered that it was warm, and the temperature induced them to come out and have a playspell and void their feces. While I was taking the pictures my clothes became badly spotted—not from unhealthy droppings, but from those as a result of the natural retention on the part of the bees that were wintering in an ordinary normal way.

I do not care how well the bees are doing; if they have been confined in the hive for over a week, either summer or winter, they will spot objects round about. But this spotting does not indicate any condition that is

alarming. But when bees come out at the entrance and stain the front of a hive with a very dark and ill-smelling stuff, then the condition of the colony is dangerous if not hopeless, especially if there is no immediate prospect of settled warm weather within the following month. But, to return to Fig. 1:

I took a photo of this particular hive because it shows admirably just how the bees were clustering on all the hives in which there were strong colonies. The bees on the cover had taken a flight, had voided their feces, and now, apparently, were taking a rest preparatory to going into the hive. Those bees that lodged on the snow were immediately chilled; but for some reason, fortunately, the great majority of the bees lodged on some wooden object, especially on the hives. At half-past one I had some fears that they might not return; but as the atmosphere turned a little cooler, and the sun was going down, all these bees took wing and re-entered their hives, and at half-past two there was scarcely a bee to be seen on any wooden object; and the few that were in sight were keeping around the storm-doors about as shown in Fig. 2.

Mr. A. J. Halter, having visited us a few days previously, on looking at these lean-to boards expressed the conviction that our little notches on the front edge were altogether too small—that the bees, many of them, would not pass through them, and, failing

FIG. 1.—HOW THE BEES TOOK AN AIRING ON A WARM DAY IN FEBRUARY AT MEDINA.

to discover the side passage, would become chilled and die. But this certainly did not prove so in our case. By reference to Fig. 1 it will be noticed how the bees were going through the side passages, seeming to have discovered that this was a more rapid way of getting into the hive. While neither photo shows it, I found in many instances where the bees were crawling through the notches on the front edge of the board.

On the 14th I visited Mr. Halter at his apiary in Akron, and found that he had the same arrangement except that his notches were very much larger. He explained that, according to his experience, bees would not go through those small notches—that we would be losing many bees; that the large notches were almost a necessity, as otherwise the entrance would become clogged with the dead.

On returning home I instructed our apiarist to examine the entrances at random; but in no single case could he find that there had been any clogging; for on the nice warm day spoken of the inmates of the hive carried out their dead, leaving the passageway clean.

It is my own private opinion that these storm-doors do not prevent bees from flying out on bright alluring days, but only tend to discourage such coming out; that, moreover, they do, to a very great extent, prevent

FIG. 2.—THE MODIFIED HALTER STORM-DOOR AS USED ON THE OUTDOOR HIVES AT MEDINA.

piercing winds from blowing in directly on the cluster of bees, and I therefore deem their use an advantage. Unless some untoward circumstances shall show otherwise, we shall use these next season.

But this can not be denied: That with them the bees still come out, and, alighting on the snow, die there. These bees are not superannuated nor diseased, as I found by picking up dozens of them that were chilled through and warming them with my breath. As soon as they revived they would take wing and fly direct to their entrance. Quite a number I smashed to see if the discharge from the intestines showed the least diseased matter; on the contrary, it seemed to be perfectly healthy—proving conclusively, as I believe, that, had there not been any snow on the ground, they would have added greatly to the prosperity and strength of the colonies to which they severally belonged.

I am thoroughly convinced that the flying-out of bees, no matter how warm the atmosphere, when snow is on the ground, is attended with considerable loss. This loss is greater in mild climates, subject to occasional thaws, than in those localities where winter comes snug and cold, and continues so until spring arrives, which, when it does arrive, continues to be warm. In a locality such as we have here in Medina, we have warm and cold weather off and on all through winter. It is these bright sunny days when the snow is on the ground that causes considerable mortality.

This brings me to the question, "Should we not keep the bees shut in the hives until warm days?" You will remember that I tried this two winters ago, shutting them in with wire-cloth porticos, and then removing them on warm days. But the result was disastrous, for apparently a few bees would attempt to escape during the time of their confinement—that is to say, a few superan-

to ward off the cold would consume largely of the stores, and this would lead to dysentery. I don't *know* that this was what happened; but I surmised it from indications.

FIG. 4.—WINTER CASE OF SECOND-HAND WRAPPING-PAPER AS USED AT MEDINA.

Even though I removed the porticos on bright suitable days, mischief had been done; and most of the hives on which these porticos were attached, the same being removed when the weather favored, resulted in the death of the colony.

THE WEBER ENTRANCE-CONTROLLER.

It will be remembered, also, that on page 96 we illustrated the Weber device. This is a contrivance to let the air pass through freely into the hive through darkened passageways and at the same time confine the bees within the hive. When the operator desires to let them have a flight, on suitable days he can do so by lifting a slide so that the bees of the colony may pass out direct.

The question may arise whether or not while confined at other times they would not stir up a commotion within the colony, resulting in disaster, as was explained in the case of the porticos just mentioned. But in the Weber device all rays of daylight are entirely shut out, and the only way by which the bees would know their entrance would be from the direction of the fresh air which would pass through wire-cloth partitions, closing the darkened passageways. Right here, I suspect, is a vital difference between the Weber device and the wire-cloth porticos which allow the light from without to pass freely into the entrance.

As explained on page 96, we had put some of them into use; but so far we have been unable to come to any conclusion, as there are no indications at present that would seem to warrant us in forming an opinion either way.

FIG. 3.—PAPER WINTER CASE AND HALTER STORM-DOOR.

nated or diseased ones would try to get out of the hive, which, failing to do, would stir up the whole colony. The cluster would expand, become chilled, and in the attempt

Figs. 3 and 4 show a hive protected by heavy wrapping-paper, the folds of which are held in place by a short piece of rope or twine. These colonies in these two hives are apparently wintering just as well as those in double-walled chaff hives; and while the paper is not put on very neatly, yet for the purpose of experiment we took second-hand wrapping-paper, just as it came, and folded it over these two hives as shown. To prevent leakage from the top we put on regular hive-covers.

Fig. 3 shows the regular Halter storm-door and how the bees were clustering around over the top of the hive, the photos having been taken the same day as the other two.

We hope to give, about six weeks hence, a full account of how these two colonies have wintered. We might remark, however, in closing, that the paper on No. 3 was hardly

lowed by a strong west wind which carried a black dust with it that settled all over the snow. It is generally supposed that seeds of this plant were carried here by the wind and lodged with the black dust. The seeds are very light, and arranged in the seed-pod similarly to those of the thistle. The small white flowers which have a yellow center appear very late in the season, generally after there has been a light frost; but, although it is so late, the bees get considerable honey from them. The first season the plant bloomed here the bees gathered about 15 lbs. of honey per colony from it. The second year I think I received fully 20 lbs. per colony, and the last season only about 10 lbs., as we had some frost almost every morning it was in bloom. If this weed (I know no other name for it) did not bloom so late it would do us more good than the

A HONEY-PLANT THAT BLOOMS AFTER THE FIRST FROST IN THE FALL.

wide enough to cover up the entire hive as it should. But as many of our subscribers have to take what they can get, we took any old thing we could find.

A FALL HONEY-PLANT.

Blossoms that do Not Appear until After the First Frost.

BY W. W. CRIM.

I am sending you a picture of a colony of bees which is conveniently near the flowers. I have been keeping bees here for about 25 years, and until three years ago I never had a fall flow of honey. Five years ago this winter we had a very heavy snowstorm fol-

lowed by a strong west wind which carried a black dust with it that settled all over the snow. It is generally supposed that seeds of this plant were carried here by the wind and lodged with the black dust. The seeds are very light, and arranged in the seed-pod similarly to those of the thistle. The small white flowers which have a yellow center appear very late in the season, generally after there has been a light frost; but, although it is so late, the bees get considerable honey from them. The first season the plant bloomed here the bees gathered about 15 lbs. of honey per colony from it. The second year I think I received fully 20 lbs. per colony, and the last season only about 10 lbs., as we had some frost almost every morning it was in bloom. If this weed (I know no other name for it) did not bloom so late it would do us more good than the

The honey is almost as white as that from clover, but has a slightly yellow tinge, and a very rank, disagreeable smell and flavor when first gathered—much worse than bass-wood; but when fully ripe it has scarcely any smell, and a rather pleasant flavor. It seems to be good for winter stores, although it candies early in the winter. I wish it would bloom twenty or thirty days earlier in the season, for I hate to see so much sweetness wasted on account of a little tardiness each season.

ORNAMENTAL HIVES.

BY W. E. STEINER.

Seeing so many different kinds of ornamental hives I decided to make some that would be both ornamental and useful. I got the style from the Pearl Agnes, and suggestions from different persons, and the hive shown in Fig. 1 was the result.

It is a standard eight-frame hive, the sides being framed together from 2 by $\frac{7}{8}$ -inch yellow pine. After framing, openings through the sides, 6×15 , are closed with glass on the inside and a tight fitting door on the outside. The bottom-board is nailed to the hive, and the entrance is provided with a small door which, if closed, will have an opening only $4 \times 4\frac{1}{2}$. If the door is open, as during the summer, the entrance is $6\frac{1}{2} \times \frac{7}{8}$. At both ends are removable plugs which act as ven-

FIG. 1.—STEINER'S ORNAMANTAL HIVE.

FIG. 2.—A REGULAR HIVE MADE TO REPRESENT A LOG CABIN.

tilators. These holes are $\frac{3}{8}$ inch in diameter, and covered with wire cloth on the inside.

In the illustration the hive has one super; but there is also a second one. Each super holds 24 4×5 plain sections with fences.

The roof parts from the super $1\frac{1}{2}$ inches below the eaves. At this point a flat cover is made across the gabled roof, making an open space in the gable, which is handy for storing bee-veils, records, etc. A door opens into this from the rear gable.

Fig. 2 shows a standard eight-frame hive with two supers containing 24 sections each. The outside is covered with willow wood, giving a log-cabin effect. The hive is painted green, and the ends of the small logs red.

SEALED COMBS OF HONEY FOR SPRING FEEDING.

The Practice of Extracting in the Spring and Feeding Back to Induce Brood-rearing, a la Alexander, Condemned; Spring Feeding of any Kind Not Favored, and Why.

BY ALLEN LATHAM.

The editor, on page 1428, in a footnote to Stray Straws, invites subscribers to offer their experience and opinion. The Straw has reference to an article by Mr. Alexander, which appeared on page 1376. I feel strongly that Mr. Alexander errs in this matter—at least in recommending others to follow his custom; errs, because what does not succeed with him is succeeding with others, and

A SAMPLE OF A PART OF A CAR OF WESTERN HONEY WHICH WAS SOLD TO THE A. I. ROOT CO., AND GRADED NO. 1; SEE EDITORIAL ON PAGE 339.

also errs because spring feeding by syrup or even dilute honey is a questionable practice.

I have had almost no experience with buckwheat honey, and but little with candied sealed honey in spring. That such honey delays the building-up of bees in the spring is attested by Mr. Alexander. Such being the case, let him and others similarly situated follow his teaching. Let all others think twice before adopting his teaching.

Most of us are not situated as is Mr. Alexander. The stores in spring are liquid honey, or, in the case of previous fall-feeding, liquid sealed syrup. Such is the case with me, and allow me, therefore, to state my own experience along this line.

I have for years compared the building-up of colonies that were fed in spring with that of those which were let alone because of their abundance of sealed stores. I can not now recall one single instance in which the spring-fed colony excelled the other. I can recall a few instances in which the fed colony developed into a very satisfactory colony, but no case of marked superiority.

Locality may have much to do with these results, and I have figured it out as follows: The matter rests upon the pollen supply. If one is situated where the early pollen supply is sufficient and *reliable*, then the bees will respond well to spring feeding or to any kind of feeding. With me the pollen supply is most unreliable some springs. There are spells of weather when for a week the bees can not gather pollen. At such a time no kind of feeding will keep up brood-rearing. The queen may continue to lay, but all unsealed brood will be eaten by the bees, although that nearly matured may be sealed.

If eggs are allowed to hatch, the young larvæ soon disappear. But let a warm spell come, the pollen be abundant, and every colony becomes endowed with a new lease of life. Within four or five days there will be great patches of glistening fat larvæ.

Some one breaks in here and asks, "Why doesn't such a state of the weather and scarcity of pollen affect the unfed colony with equal severity with the colony which has been stimulated?" There are three reasons at least. In the first place the unfed colony has not been overstimulated too early in the season, and hence the bees have not exhausted the pollen in sight.

Secondly, the unfed colony is uncovering a supply of pollen every day, pollen packed away the year before, and kept sweet and good under its sealing of honey.

Thirdly, the unfed colony has a greater store of pollen to begin with.

No one will deny the possibility of starting a colony into too rapid breeding and thus exhausting the pollen supply before the new pollen is sufficiently abundant. Such a thing may not happen with the expert, and probably does not with Mr. Alexander, if for no other reason than that he waits till about May first before beginning to stimulate his colonies with feed; but it is almost sure to happen with the enthusiastic beginner who will start in to follow Mr. Alexander's advice. The results are very disastrous—tired queen, discouraged bees, and a general apathy difficult to overcome.

That the unfed colony should have a better initial supply of pollen in the first place may not at first be evident, but the explanation is simple. As is well known, all normal

colonies keep a fringe of pollen about the brood-nest. As the brood-nest normally shrinks with the waning of the season, and the accumulation of honey increases, this pollen fringe becomes engulfed in the honey, and is preserved for spring consumption. There are several pounds of this honey-preserved pollen in every well-stocked colony. Such a colony in spring can increase almost to swarming strength without bringing into the hive any thing besides water. Even to the old and experienced bee-keeper the speed with which these combs of honey and pollen become bees is astonishing.

Far otherwise is it with the colony whose combs have been kept empty by the extractor, and which is fed in fall for winter, and again in spring for breeding. Such a colony stores as much as possible of its winter feed in cells free of pollen, for it is fed at a time when the brood-nest is no longer strictly normal as regards its fringe of pollen. Very little pollen is preserved, and such as happens to lie in open cells becomes sour or moldy. This pollen is unfit for breeding, is not relished by the bees, and so in such a colony the breeding does not go on prosperously.

Extracting the brood-nest in early May, to be sure, may not bring about such a result as is pictured in the preceding paragraph; but, even if not attended with loss, it surely is not worth while in this locality. My experience with my large let-alone hives proves this: As may be known to some of my readers, I practice a sort of happy-go-lucky mode of keeping some of my colonies. I have some 75 colonies in large hives—those having a capacity of over three cubic feet, holding a score of frames having dimensions exceeding those of the Langstroth frame. The brood-nest of about ten-Langstroth-frame capacity is in front, and is separated from the store-frames by zinc. The brood-nest is seldom disturbed except from necessity, sometimes for a year or more. When fall comes these brood-nests are heavy with honey and pollen, and are populated by a huge host, often as many as 40,000 bees. To open one of these brood-nests late in April would astonish you bee-keepers who talk about your colonies covering three, five, or seven frames at that season. Many of these colonies in April, if queen-right, will rival strong colonies in May. These colonies are never stimulated in any way. Nor are they molly-coddled in any way. Even their entrances are left unchanged in size the year round, the width of the hive and one inch deep, mouse-guarded by a *cheval-de-frise* of nails.

Some of these large colonies have on one or two occasions been fortunate enough to enjoy a flow of honey in May, and the results were most gratifying.

I therefore feel constrained to cry out against all spring feeding for stimulation. Having only good will for all who offer such advice, I must nevertheless denounce the advice as unsound. The advice is likely to bring disappointment, even if it does not bring any thing worse. There are times when we must feed in spring, but let us not

create such conditions voluntarily. A queen which will respond properly to spring feeding will attend to her duties under any normal condition. A queen which will not fill her brood-nest under normal conditions, with combs of sealed honey about her dominions, can not be made to do it through any sort of feeding. Feeding her colony will result in clogging the brood-nest with honey or syrup instead of with bees.

Norwich, Ct.

FEEDING BACK IN THE SPRING.

The Alexander Plan for Extracting and Feeding Back in the Spring Not Indorsed; Spring Feeding Discouraged; Not too Much Honey but a Poor Queen the Cause of Little Brood.

BY M. A. GILL.

I have been reading with much interest the article from E. W. Alexander upon the question of brood-rearing in the spring, and there are a few places in his plans upon which I should like to turn a little sidelight, so that beginners in nearly every place in the United States except around Delanson, N. Y., won't get it into their heads that they can extract three or four thousand pounds of honey (old honey) before fruit-bloom while getting their bees strong for the harvest.

There are several things except honey that are absolutely necessary to obtain before brood-rearing can be carried on successfully in the spring of the year. The first essential is a good queen; second, proper temperature, both inside and outside of the hive; third, natural pollen coming in if there is a scarcity in the hive.

The fact that a card of honey hung into one of Mr. Alexander's colonies in the month of May acts like a dummy and prevents the queen from spreading her brood across the hive proves beyond cavil or doubt that Delanson is a most wonderful spring location.

Either in Wisconsin or Colorado at this time of year it is neither necessary nor profitable to use the extractor to remove old honey; for just at that time of year (if the three essentials already mentioned exist) the bees start up an automatic reversible extractor so that I am more liable to be short three thousand pounds than to have a surplus.

In my twelve apiaries I have three that I judge are something like Mr. Alexander's, and some seasons they would get a little too much honey for their best good in brood-rearing, which I take away and haul to other yards that are destitute and exchange for empty combs; and I do not believe that the great mass of bee-keepers need have any fears about taking Mr. Doolittle's advice in giving combs of sealed honey in the month of May; for if conditions are right they will turn it into brood, and no other kind of feeding or fussing will avail any thing until conditions are right.

The question of *profitable* stimulative feeding in early spring is one that requires as

much skill and experience as any one branch of the business; and advice upon this important point can not be handed out like pills by a medicine-peddler. Each one must study his own particular field and flora, and ascertain when we need the workers. At any rate, don't commence stimulative feeding too soon; and if you commence at all, keep it up liberally until the flow comes; for bees that are being fed lose much of their hustle for natural stores, and await your coming like a beggar on the street corner. Like Mr Alexander, I too have been over the ground for 30 years, and will say I very much doubt if it pays to practice stimulative feeding, for the purpose of brood-rearing, in early spring.

But be sure to feed enough so there is no starving; and if you are not in a location where nature will back up good prolific queens for thirty days before the honey-flow, move to one that will, for there are plenty of such locations. As Mr. Alexander says, the month of May is the time for all bee-men to be most active, for we *must* have brood in this month; but I would rather my queens would save their strength and forces until this date than to do extensive early breeding.

Mr. Alexander speaks of neighbors' bees being too weak to work in supers, and says it is because there is too much honey in the brood-nest. Now, is he mistaken, or am I? for I think that, when a normal colony of bees has lived off from the stores in any hive from August until the next June, and the combs are still so full of honey that there is no room for brood, then that is a plain indictment against the queen, and it is her fault that the honey is there in excess.

I believe with Mr. Alexander that every hive should contain a large amount of empty worker comb during May and June; but what is worrying ninety-nine out of every hundred bee-keepers in the United States is that this comb will get empty too soon before the flow comes, so that a comb of sealed honey would not long serve as a dummy in most locations.

I think very likely that if Dr. Lyon had taken a picture of the *inside* of Mr. Alexander's hive the past spring, he wouldn't have found as many bees as he did on the *outside* of the hives one year ago. So we are all bound, more or less, by that inexorable law of nature that says you can not raise brood until the conditions are right. And there is *no* condition so favorable as natural warmth, a little natural honey coming in at the entrance, and natural pollen in abundance; and these conditions so often exist for thirty days before the main honey-flow that it does not pay to make stimulative feeding a part of our plan.

Longmont, Col., Nov. 4.

[Mr. Gill is always a valued correspondent; but in the foregoing he has quite outdone himself. A bee-keeper with 12 apiaries ought to know something about practical management; but when such a man disagrees with another strong man in the person of Alexander, the beginner may not know which

way to turn. Our own experience, together with that of those who write on the subject in this issue, seems to support Mr. Gill. Indeed, we may say that the average beginner should avoid spring feeding if he can—certainly if the hive is well supplied with sealed stores.—ED.]

CELLAR VENTILATION.

When and How to Set the Bees Out; Alexander's Spring Feeding Not Indorsed; the Let-alone Policy for the Beginners Favored.

BY R. F. HOLTERMANN.

To me, from my youth up, agriculture in its various forms has appeared to give abundant scope for the highest exercise of intelligent thought and study. The person who pursues a cast-iron rule season after season in bee-keeping, or in other lines of agriculture, does not act intelligently, nor does he obtain the measure of success secured by the one who studies season after season, and who tries to acquaint himself with weather signs and conditions, and then seeks in his management to act according to these varying conditions. This is particularly true of spring management.

To those who have their bees on their summer stands all winter, having them packed, and provided with an abundance of good stores, I shall have nothing special to say. There may, however, be certain suggestions in this article which some might find to their advantage to act upon in future plans.

WHEN TO SET BEES OUT OF THE CELLAR.

Those who winter in repositories must, toward spring, exercise some judgment as to when to set out their bees. General weather conditions, the condition of the ground upon which the bees are to stand, the specific locality of the apiary, the condition of the bees, the number of the colonies in the repository, and the nature of the repository, all must be considered in a decision upon this important question. After all this has been considered we must run our risk as to the nature of the weather in the future, no matter what our decision (setting out or not setting out). If the weather keeps cold, and the ground where the hives have to be placed is covered with snow, it is practically impossible to set out the bees. I have seen hundreds of bees perish, all belonging to one colony, because there was an insignificant coating of ice on the ground in front of the entrance when other colonies in the apiary, and without the small patch of ice, did not suffer. The location of my home apiary, where the cellar is situated, is well sheltered with elevations of land, timber, buildings, and fences. When the bees are set out they are in a very sheltered place, and they can be set out when others in a more exposed place would, perhaps, do better by remaining in winter quarters. Let me say here it is an immense advantage to have an apiary located in a place sheltered from wind; and the average bee-

keeper in village, town, or city has in this respect an advantage over the average country bee-keeper, particularly in spring, autumn, and winter. Right here let me put in a plea on the ground of beauty, comfort, and enhanced intrinsic value of property for those who own their homes, to plant more evergreen trees about their buildings and orchards.

From many years' experience so far as conditions will allow, I am an advocate of what might be termed early setting out. If many colonies, or a considerable percentage of colonies, have broken cluster; if they are uneasy, and readily fly to a candlelight in the cellar, the sooner the bees get a cleansing flight the better if they can do so with safety, especially if they will be in a sheltered place. The loss of vitality from day to day under conditions of unrest is very great. It does not take long to kill bees by worry, be it in or out of the cellar; and a cleansing flight has a wonderful effect in this direction. More than that, I am satisfied that one restless colony where hives are piled one above the other, and side by side, transmits that restlessness to others, and herein is one weak point in cellar wintering. The condition of the bees then as to the above points might influence me in deciding on the time of setting out.

The more bees there are in the cellar, other things being equal, the more difficult it is to keep them quiet when the outside temperature rises, for their activity adds *very greatly* to a temperature already too high. It is also very much more difficult to keep up ventilation when the outside temperature is about the same as that inside. In 1903 the first bees were set out by me March 14, the last, March 19; the first pollen was gathered March 19. In 1904, first, March 22; the last, April 5, at which date the buds had not even swelled. In 1906 the first pollen was gathered April 12. In 1907 the first bees were set out March 12; the last, March 18, and the first pollen was gathered March 29, after which we had several months of what we thought was altogether too much like winter to suit bees.

As to the manner of setting out, I should like to air the cellar well so that it will not be, as to purity of air, a great change to carry them out. I have followed with great satisfaction the plan suggested some years ago in GLEANINGS by E. W. Alexander; viz., to set them out previous to the morning upon which we calculate they shall fly. The previous evening or early night is a good time. If they do not get a flight for a day or two after, I have found it an advantage. There will be less excitement when they fly; weaker colonies, and colonies not needing a flight badly, may not fly as soon as others do, and there will be less confusion and less loss to weaker colonies by having their bees drift to the hives where the bees are flying in great numbers; particularly is there this danger if the wind is blowing hard.

Having nearly an acre of ground in my apiary, and the bees scattered, when brought

home in the fall, over the entire ground, and setting out only a part of the bees at a time (there are 500 colonies in the cellar now), and placing the first together in one part of the apiary, and all without regard to their previous location, I am thoroughly convinced that wintering them as I winter them, and confined for the length of time they are, bees, when they take their first flight, relocate themselves and do not return to last year's stand.

I do not think it good practice to seek to keep bees in winter quarters by changing the air at night and shutting off ventilation during the day. Such changes are too violent, and produce constant activity and brood-rearing. A colony perfectly wintered in the cellar should have no brood when placed on the summer stand.

ALEXANDER'S PLAN OF EXTRACTING AND FEEDING BACK IN THE SPRING NOT INDORSED.

Under the heading of "Brood-rearing in the Spring," page 1377, last year, is a statement by E. W. Alexander which, in my estimation, would be dangerous for many to follow. After referring to combs of honey inserted in the brood-chamber for stimulative purposes about May 1, he writes, "If we uncapped them it was sure to start a bad case of robbing; if they were left capped, then they simply formed a division-board which prevented the queen from spreading her brood across the hive." With the latter statement I would heartily agree; but not with the former if the colony is strong enough to stand that kind of treatment, particularly if the work is done toward evening.

In the same column, however, so far as robbing is concerned, Mr. Alexander, to get rid of this objectionable robbing, suggests a remedy far worse than the disease. He states, "After realizing the folly of this erroneous method of spring feeding we commenced to extract all capped honey from the brood-nest about May 1, and in its place, when necessary, we fed a little warm thin honey or sugar syrup daily for about a month." How can there be a bad case of robbing from merely uncapping one comb, when there is no such objection to taking combs of honey and brood out of the hive, extracting the capped honey, then putting back the combs wet with adhering honey? and if this handling at a critical time were not enough objection, I think the danger of unduly displacing the brood-chamber as to order of brood and pollen is great enough to warrant me in raising a note of warning, in all kindness, and saying *don't*.

Mr. Alexander's advice, to see that the brood-chamber is not clogged with pollen and honey, is good. Many a queen does not get proper room, yet more harm is done by the average bee-keeper in not having enough of these in the hive.

As to robbing, prevention is worth much. Discard bottom-boards, hives, and covers which, through defects, compel the bees to guard any thing but their entrance to the

hive. Take out combs which the bees can not properly protect by covering them, otherwise with cool nights strong colonies are out and flying the next morning and ready to rob before weaker colonies, owing to the chilling of the outside of the cluster, can become active and defend their hives and stores.

DON'T CHANGE THE APPEARANCE OF THE HIVE.

Mr. Jacob Alpaugh, Eden, Ont., in a conversation with me, pointed out the danger of changing during uncertain weather, and, after the bees had located themselves, the outside appearance of the front of the hive. This is sometimes done with shade-boards, etc. Once located as the bees fly out, they do not examine the front; and in cool weather, returning and finding a changed condition, they hesitate, fly about, and become chilled. He states that, if they once fall, they may again take wing; but they appear stupefied, and generally fly away never to return. I am satisfied that Mr. Alpaugh is correct in his observations and deductions.

In conclusion, let me say spring management is of great importance. The greater the inexperience of the bee-keeper, the less what he knows, the safer the *let-alone* policy after seeing that the bees have a good queen and plenty of stores. To those of more experience, a scriptural injunction will not be out of place: "Prove all things; hold fast to that which is good."

Brantford, Canada.

BUILDING UP COLONIES.

Colonies Divided into Three Classes; Swarms from the Strongest Hived with the Weakest; Strengthening Medium Colonies with Frames of Brood.

BY WM. W. CASE.

In the spring every apiary contains three classes of colonies—weak, medium, and strong. The first are generally regarded as useless, by some as nuisances, and as having worthless queens; the second generally get in good enough shape for a little surplus, while too frequently the latter expend their energy in giving off swarms, giving their profits in increase and not in honey. Such I find to be too frequently the case with a far too large number of bee-keepers, especially those who keep small apiaries for honey, and who have no room for (nor desire) increase.

There are certain well-known conditions that are essential to the production of a bountiful honey crop; and a general law governing these conditions, without which, no matter how favorable nectar conditions are, satisfactory results can not be attained in net returns. An apiary, to be a profit-payer, must consist of a number of colonies, greater or less, all of which are in a homogeneous condition of strength, that strength to be kept up by the progeny of a first-class queen, and then not ruined at the time of the honey harvest by an uncontrollable attack

of swarming fever that turns a honey-flow into increase and not honey.

The bane of most apiaries in the spring is the weak colony, a colony usually regarded as worthless, or as a candidate for combs of brood from more fortunate neighbors—a plan which badly injures the stronger stocks at that time of the year, and is of but little value to the weak colony. A weak colony is frequently unable to care for more brood-combs properly, so the result is the death of the brood from chilling, or the bees that hatch will be of such low vitality as to be practically worthless.

Others try to help the weak ones by feeding and nursing, and sometimes succeed in building them up to satisfactory strength, but only at the *close* and not the *beginning* of the season, with a result of barely enough stores to carry them again through the succeeding winter and give nothing whatever for daily bread for the owner.

In but few sections of the North is it at all worth while to try to feed a weak colony to working condition in time for a flow from clover, and it is only throwing away good money to rob strong colonies of brood to build them up. If feeding for stimulative brood-rearing must be indulged in at all, we should feed the very best ones and get every bee hatched possible before swarming commences, and let the weak ones take care of themselves, of course seeing to it that they are kept supplied with honey, as warm as possible, and protected from robbers.

Now, with the advent of swarming, comes the day when our weak colonies become our money-makers. When the first swarm issues, go to the strongest weak colony, one, say, that has reached five or six partly filled combs of brood, but which will remain too weak of itself to yield surplus; smoke thoroughly to cause the bees to fill themselves with honey, and catch and cage the queen and remove her. Now hive the swarm *right into this weak colony* and give plenty of room for surplus. As all the bees are well filled with honey there will rarely be any dispute. This poor worthless colony has now become, like magic, one of the very best in the apiary, and possesses every requirement for yielding a large surplus, viz., a medium amount of brood, a large force of field bees stimulated by having swarmed, a good force of nurse bees already in the hive, and a first-class queen. Such a colony will rarely swarm again during the season, as, by the time they are again gorged with brood, the honey-flow will generally be so far advanced as to discourage further swarming.

Now to return to the hive from which the swarm issued. Next day about noon, when the few field bees are out foraging, smoke the bees; and, if you have time, remove all queen-cells and turn the queen taken from the weak colony loose on the combs. She will be accepted ninety-nine times out of a hundred, and no questions asked. If rushed for time, just turn her loose on the combs anyhow, and she will take care of the queen-cells herself. In about a week this colony

will have regained its normal strength, and, having a laying queen, will constantly increase that strength through the honey season, and will but rarely swarm. This queen may acquit herself as one of the very best in the apiary the rest of the season.

Now from two colonies, the one worthless and the other one liable to do too much swarming, have been evolved two colonies, both in perfect condition for a large yield of finest honey. Continue this treatment, always selecting the strongest weak one, as the weaker ones each day all naturally become stronger, until all weak colonies are brought up to the standard of extra working condition.

TREATMENT OF THE MEDIUM COLONIES.

But now how about those medium colonies, too strong to be treated as above, and not strong enough to be very profitable in their condition? If we occasionally rehive a swarm on the old stand and in the old hive, and take out four of the best combs of brood, putting sheets of foundation in their places, we can give two combs of brood to two each of those colonies, taking out a couple of poor combs of brood to make room for them, which can be formed into a nucleus and given a queen-cell. These two full frames of brood should immediately bring the medium colonies to the required strength for work, while the swarm hived on the old stand should also give a nice surplus.

WHAT TO DO IF THERE ARE MORE SWARMS THAN WEAK COLONIES.

Should the indications be that there will be more swarms than weak colonies, select the very best colonies as regards both purity and industry, and, when they swarm, remove the hive, from which the swarm issued, to a new stand, and hive the swarm on the old stand, giving it, say, three combs of brood from the old stock, and three or four sheets of foundation, and give plenty of surplus room. This colony, having all the old bees, and some brood, should also give a nice surplus.

Now to go back to the old stock removed to the new stand. Take two nucleus-hives, made to take frames the same size as those in the hive; place them on separate stands, give each one or two combs of brood and a good cell from the hive, and let all three raise queens. Any surplus cells can be cut out and used in other nuclei formed in the same way for the next seven days, thus hastening hatching several days and also increasing the number of queens raised from choice mothers.

After all the queens in both nuclei and central hive are *laying* and have *filled* all their combs with brood, the queens may be taken from the nuclei and used to replace the poorest queens in the apiary, and the brood and bees united with the main colony, thus giving it at once seven or eight full combs of brood, and making it at once a full colony. Queens reared in this manner have no superiors in beedom.

This method is simple enough for the am-

ateur with half a dozen colonies, and equally valuable for the largest of home apiaries. It is also elastic; i. e., it can be modified to suit many different conditions; keeps every colony to the top notch of strength during the honey-flow, keeps every queen working full time during the whole season, and keeps every colony, nuclei excepted, with a laying queen all the time, and makes swarming a blessing instead of a nuisance; allows a moderate increase through the nucleus system, and keeps the apiary supplied with a class of queens having no superiors on earth.

Any tendency to degeneration from close breeding can be immediately checked by the purchase of choice breeding-queens of other strains—not to replace but to *blend* with the best strains already in the apiary; and any one breeding on these lines would in a short time refuse to have his whole apiary requeened free of charge by the best breeder in the country.

If the apiary is run for comb honey, care must be used to produce nothing but a fancy article—one that will command the top, or a premium over the top quotations; and it is just as easy to produce a crop all A 1 to fancy as it is to produce all number two or worse.

Comb honey, if to command the very best prices, must be removed from the hive about as fast as finished, and before becoming travel-stained, and properly stored and cured, and not left on the hive until the season's close. If every separator used in the apiary, wood or tin, is not thoroughly washed and *wiped dry* before being used in the supers, much of the capped surface is bound to have a non-attractive smutty appearance; and all drawn combs in sections from the previous season, no matter how white, must have the ends of the cells cut down before using, or an expert will condemn every section so used, at a glance. Likewise it is difficult to produce nice honey on a hive containing old dark combs unless they contain freshly sealed honey at their tops.

If the apiary is run for extracted honey, and we expect the honey to bring the top price as a table delicacy, it can not become too ripe before extracting; and for best quality of product it should remain on the hive three to six weeks after sealing before being extracted; while for general market honey it may be extracted as soon as sealed, but not before.

Frenchtown, N. J.

PROTECTION DURING THE WINTER.

Temporary Sheds vs. Outer Cases.

BY W. T. DAVIDSON.

Nothing that I know of at present will beat a good shed for wintering bees. I can pack my hives in straw in a good shed, and get excellent results. I wintered my bees three winters in a shed without the loss of a colony. Sheds are very unhandy to work under, but I think I have designed one that will be

handy. I will make the cover out of boards in 12-ft. sections, covered with some kind of roofing. In summer, when I don't need the cover, I can remove it.

But such a shed will cost about as much as good pine winter cases. I bought pine flooring for \$2.00 per 100 ft., and made some winter cases. If bottom-boards, covers, and all are made, it takes about 20 feet of lumber per case. According to these figures, 100 ft. will make five cases. The lumber in these five cases will cost \$2 00, which is 40 cts. per case. There is a little more to add to this—that is, the roofing. Either paper or metal roofing can be used; but my advice is to use the best roofing that can be had. Such covers can be used for shade-boards in summer. For this locality I don't think this size of winter case for eight-frame hives would cost over 50 or 60 cts. per case for material, and I believe that they would last a lifetime. I can pack my bees for winter right on their summer stands, and not move them enough to disturb them. In extremely cold climates the cases can be made larger. The case has a bottom-board and cover and a body all separate. Put the bottom-board under the hive; set the body down over the hive; put on your packing; put on the cover, and your bees are ready for winter.

These winter cases cost a little money and labor to begin with; but while you are looking at the cost of the winter cases you must count the cost of wrapping the hives with paper, and that you will have to buy new paper every year. I do not believe that the paper wrapper is half as good as a winter case. After you fold old newspapers under the wrapper, count the cost for fifteen years on the paper wrapping and you will begin to see a winter case made like some I have, and painted, should last more than 30 years. It is hard for me to decide which is better—a good shed or a good winter case. Right now I am in favor of the winter case. It is not what a thing costs, but what it is worth.

Velpen, Ind.

RENDERING COLONIES NORMAL.

Some Strong Colonies Saved, and a Weak One Made Good.

BY A. J. BURNS.

Some time ago I found several colonies whose queens were laying drone eggs, and several more with laying workers, all strong in bees, and with an abundance of honey—too good to break up if I could save them, so I sent for some new queens, not having any extra ones in the yard. I at once set about preparing a place for them by selecting strong colonies with vigorous queens by putting the queen below an excluder, and as much of the sealed brood above as practicable. The queens came in about two weeks. I had then an upper story of strong young bees which I set off on a close-fitting frame covered with a fine wire screen as a bottom-

board, thus confining the bees, but giving them good ventilation. I carried them into the honey-house, where, within an hour, I placed a cage containing a new queen between the frames just as they came, and left them until the next morning, when I removed the hive containing the old queen on to the old stand a short distance away, and placed these upper stories with the new queens on the old stand on a regular bottom. At the end of 24 hours I gave the bees access to the candy, where they had not already reached it. At the end of three or four days many of the bees had gone back to the old stand. I then went around and pinched out the drone-layers, shaved off the heads of what brood was capped, and sprinkled sulphur over the unsealed brood, and treated the brood of the fertile workers in the same manner. The following day I put them temporarily aside and placed the hive and queen, displaced by the new queen, on their stand; covered it with a paper through which I had punched a hole with a leadpencil, and on top of these their hives that I had put aside, making the hives three-story, and the mutilated brood in the third story—no honey except what might be in the frames containing this brood. In a few days all the bees were down with the queen, the mutilated brood above deserted.

At another place I noticed a colony that seemed very light; and on uncovering it a score or two of robbers came tumbling out, although I did not notice any on the outside as I came up. Upon examining I found the honey all gone except the least bit in one corner of a frame covered by about a tablespoonful of bees, and in their midst a queen, all apparently about to expire. I put in three or four frames of honey from elsewhere, closed up the entrance bee-tight, and covered up the hive. The next day, between nine and ten o'clock, I set an empty hive on top, covering it with a tight-fitting frame covered with screen wire, and laid the cover on top; then with a nucleus box and large funnel I went around where the bees could be spared and took out a few bees at a place, being careful not to get a queen until I had in my box bees enough to make a good fair colony, which I carried to the honey-house, and put them in a darkened corner for between six and eight hours, and at sundown I took them to this queen and her bees, uncovered the hive, unhooked the cover to the nucleus-box, took it between my hands, holding the cover shut while I jarred it on the ground to settle the bees to the side opposite the cover; and before they had time to recover themselves I dumped them into the empty hive and covered it with the screen frame and placed the hive-cover on top. The next morning they were all down among the frames. I left the hive shut up for three full days, and at sundown of the third day I opened the entrance. I did not look at them until the second day after, when I found the bees spread over the combs, some of them industriously cleaning and polishing cells, and the queen hustling around among them,

depositing eggs as if all had always lived there; and at this writing, some ten or twelve days later, there is quite a patch of brood on two of the frames, part of it sealed. I see no reason why they should not do as well as any other colony.

San Diego, Cal., Nov. 11.

LIFTING HEAVY CANS OF HONEY.

A Rope and Tackle for the Purpose; Fastening Foundation.

BY C. F. SMITH.

Some kinds of work connected with "our chosen pursuit," that we formerly approached with dread, we now find pleasure in doing because of improved methods. I will describe two plans that I have followed for the past year or two. When one's sales do not aggregate over 10,000 lbs., and they are quite evenly distributed throughout the year, the block-and-pulley device for lifting 60-lb. cans during the melting is all right. In a rush, two wash-boilers can be used. Each can must have a sling of its own. There must be two $\frac{1}{4}$ -inch strips, 9 in. long, for each can to rest on, to which a galvanized wire is stapled, long enough to extend up over the can to form a bail or handle—two for each can, and all the same length. I use two small $\frac{1}{2}$ -in. double blocks with $\frac{3}{8}$ or $\frac{1}{2}$ in. rope. I insert a $\frac{1}{4}$ -inch screw-hook through the plaster into a joist directly over the front of the stove. I always empty the honey through a cloth strainer into a can around which a few thicknesses of paper are wrapped to hold heat. I use an oil-faucet on this can, with entire satisfaction.

The more experience I have in bottling honey, the less heat I apply. I now heat the water to 130°. A man can hold his fingers in water at that temperature 15 seconds; a woman, 30. The honey does not candy as quickly now as it did formerly when heated to a higher degree. The reason of this, probably, is that the excessive heat evaporates too much, which causes the honey to crystallize. I used to be continually bringing bottles home from the store to remelt; but have not been bothered any since I adopted the 130° rule. I think some kinds of honey will stand more heat than others; but 130° is the limit with me. When sealed at 100° it does not candy under ordinary circumstances. I uncup the cans while melting, and never missed any aroma.

Dread No. 2 that was turned into a pleasure is wiring and putting in foundation. Wire lengthwise of a frame tightly. Lay the wired frame on the foundation with your thumb on or toward the bottom-bar, and draw the wires downward as you imbed with

the old rocker imbedder. Now the foundation will gently crowd the top-bar, which, from this method, had better be plain or flat. Imbed three to five hives or supers, leaving the frames piled up, top-bars to the right. I fasten the foundation with melted wax from an oiler, at the rate of four per minute, going over both sides, and I never had one come loose.

The oiler should be large enough to hold at least a pint, and should be provided with a handle. The diameter of the spout at the small end should be about $\frac{1}{4}$ inch. The opening should be reduced with a tapered

wooden plug pierced with a hole the size of an eight-penny wire nail.

To prevent the wax from chilling, the spout should be wrapped with woolen cloth or asbestos; but as an additional precaution I drop a hot wire into the opening every time I set the can down.

The wax should first be melted on the stove and then heated by means of a single-wick oil-burner. All the appliances mentioned can be obtained at any hardware store for two or three dollars, and they will pay for themselves in a month.

Cheboygan, Mich.

[Our correspondent has given us several valuable hints. A small tackle like the one shown here can be purchased at any hardware store for a very small sum. A little outfit like this, costing a comparatively small amount, will save a lot of hard work and severe strains on the back and shoulders.

The scheme of pulling the wires *downward* while imbedding, to cause an upward strain when in the hive, is excellent. If any correspondent has suggested it before, we do not now recall it.

Mr Smith refers to one more thing; and that is, he finds it advisable not to heat the water hotter than 130°. We should like to emphasize this advice, because we believe it to be very important.

Incidentally we can not help poking a little fun at Dr. Miller, who had a little fun at our expense because we said at the National convention at Harrisburg that 140° was too hot for one to bear his hand in; but some people can stand a higher degree of heat than others, especially women; and as thermometers are so very cheap we do not see how any one who does any business in bottling can afford to get along without one; and while one is about it he should get a good one.—ED.]

TRANSFERRING BEES.

Why it is Best to Place the Old Hive Below the New One.

BY E. W. ALEXANDER.

In answer to Dr. Miller's ninth "Straw," July 15, 1907, p. 947, as to why I prefer putting the undesirable hive under the one I wish to keep the bees in, instead of on top, I will say I have always found them more inclined to commence work above their brood where the temperature is warmer and more even than under the excluder or near the entrance. I should have mentioned that it would be much better to place a frame of brood in the new hive, then the bees would go up, and the queen continue to lay. She will seldom commence laying in dry combs for several days, either above or below the excluder, unless the colony is strong and honey is coming in fast. One of the principal reasons for putting the old hive under is that, at the end of three weeks, it will contain but little honey, and its combs will be about ready for wax; whereas if the old hive is placed on top, then we have but little honey in the new hive, and the old one is full of honey in an undesirable condition. This is especially so if we use foundation instead of empty combs. It is for these reasons that I prefer putting the old hive under the new one.

In one case the new colony at the end of three weeks will be all that could be desired. In the other case the new colony would be light in honey, and, consequently, scant of brood, and its foundation very poorly drawn out. I do not put the new hive under the old one. The object to be gained is to draw

all that is good in the old hive into the new one as soon as possible; and from our experience we find the above to be the better way.

Delanson, N. Y.

THE ALEXANDER PLAN FOR WEAK COLONIES MODIFIED.

More Honey Produced if the Two Colonies are not Separated; Producing Comb and Extracted at the Same Time.

BY J. W. DICKSON.

In the Feb. 15th issue of last year, p. 232, I notice an article on the use of excluders. I will give my plan in brief for the production of comb and extracted honey.

In the early spring, just before I commenced to feed for brood-rearing, I set the weakest colonies over the strong ones, with a queen-excluding honey-board between them; feed half a pint at night to each colony till the desired amount of brood is reared. Then when the flow comes on I pinch the head of the poorer queen, take off the zinc, and then add bodies filled with extracting-frames as needed. Next, I place a super on top filled with sections and full sheets of comb; and when the season is over I take off sections, pack them away, after which I take off the extracting-bodies and extract.

I will now tell you what I gain by this method. By this plan I have two hive-bodies filled with brood so they are doubly strong compared with those managed in the ordinary way, and will make more honey than they will to build up on the Alexander plan, then divided when the flow comes on. Then some of my customers want comb honey and some extracted, so I am able to accommodate all. I can produce as much comb honey in this way as I did when I ran for comb honey altogether, and have the extracted besides. Only about 15 per cent of my bees managed on the above plan ever swarm.

Now, I guess you will wonder how I keep from reducing my regular number of colonies. I do that as follows: I run a few colonies for comb honey exclusively, and they will all swarm; then in the spring, if I am a little below the normal number I buy a few colonies in box hives at from \$1.00 to \$1.50 each, transfer them on my extracting-frames, and go on as usual.

I never use excluders for comb or extracted honey, only as above stated. My idea is to have the bees from two queens united, and at the proper age to work when the flow comes on. By doing this a larger per cent of them will leave these strong hives in search of honey than if managed differently.

[We believe that more bee-keepers would find it to their advantage to produce comb and extracted honey at the same time as above outlined. The plan, as a whole, we believe to be excellent because we have tested something similar and found it to be good. —ED.]

TESTING HONEY.

A Hydrometer for Finding the Specific Gravity.

BY E. D. TOWNSEND.

I formerly used a hydrometer in photography, and have often thought of using one to test the specific gravity of honey, but have never known what temperature to test by, for honey is affected by the temperature in that, the colder the honey, the higher the test. The thermometer should be of the all-glass kind, and should be tested.

I presume that, on account of its long name, many will hold back from using the hydrometer for a long time, at least, thinking it is something for the "scientific fellow." Really, it is one of the most simple of instruments, and is just as readily understood as the thermometer. I should like to know what temperature the government officials use in testing honey.

Perhaps there are other ways for testing honey. At any rate, we are hungry for news along this line.

One of the uses to which the hydrometer could be put would be testing the specific gravity of all honey at extracting time. In this way a producer could work very intelligently. To illustrate, we will suppose that, for some reason or other, he should decide to extract some honey during the honey-flow; and if he were not quite satisfied whether the honey is well cured he can extract a little, heat it to the required temperature, and test it; and if it falls below the standard he should stop extracting until the honey is thick enough.

Suppose the dealer were progressive, and had supplied himself with a hydrometer and thermometer; the producer could then tell him what his honey tested, and the dealer could answer, perhaps, as follows: "We are paying to-day for white-clover extracted honey the following schedule of prices, based on the specific gravity of the honey," etc. In a note at the bottom he would explain that any honey that did not come up to the lowest test would have to go at a reduced price for baker stock. My idea would be that the dealer, also, should sell to his customers from this same schedule of prices, of course adding his profit.

If ordinary clover honey tested 40, good honey 41, and extra good or the best, 42, the dealer might quote the 42 at 10 cts. per pound, the 41 at 9 cts., and the 40 at 8½. It is evident in my mind that the 42 test would be the most sought-after grade, while the 41 would be a close second. There will be few low-test grades, for it will be too much of a temptation to produce the best, on account of so much difference in price.

The honey business is on a par with the butter trade to-day; and as I have been on both sides of the counter I know from experience just what I'm talking about. A takes a roll of average butter to the grocery when butter is worth 15 cts. a pound, and gets what his butter is worth. B takes a roll of

butter of extra-good quality, and, though it is worth 20 cts., he gets only 15, for that is the market price. C brings in a roll of butter of very poor quality, and, though the market price for renovated butter is only 10 cts., he sells it at 15, and therefore really pockets 5 cts. of B's money. The extracted-honey market is managed on the same principle.

Remus, Mich.

[This is a field worth investigating. In the meantime it would, perhaps, be well to bear in mind that locality and the kind of honey would have much to do with this question of specific gravity. York State buckwheat, for example, would naturally have a greater density than the same honey produced elsewhere. Colorado alfalfa would be thicker than alfalfa in some parts of California and Nebraska. What would be regarded as a standard of specific gravity for one locality would not be accepted for another.

Again, different kinds of honey in the same locality would vary greatly as to the number of pounds to the gallon.

Still again, artificially ripened honey and that ripened in the hive by the bees might have exactly the same weight per gallon, and yet one be superior to the other in point of aroma or flavor.

Having said all this, we are of the opinion that bee-keepers might use hydrometers to very good advantage, and that their employment would be far better than mere guesses as to the density of the honey to be extracted.—Ed.]

THE NEW PURE-FOOD LAW.

Some Questions Concerning it.

BY WM. RUGE.

The pure-food law, I am afraid, will work against a good many bee-keepers like myself, who, not raising enough honey themselves to supply their patrons, have been in the habit of buying honey from other bee-keepers or dealers in honey. You say the main thing for such buyers is to get a guarantee of purity from the seller—that this will render the buyer safe in case the purity of the honey when retailed should be questioned. Now, I can not see how this can be. Suppose I buy a lot of honey from a dealer, with a guarantee, and another lot from another dealer or bee-keeper, both lots of honey to be sold to my customers—consumers and retailers. I have to bottle this honey. Am I supposed to mark *each* bottle in some way to be able to know at any time from whom I bought the honey in any of the bottles, should somebody question the purity of the honey and get me into court? And suppose the honey is pronounced adulterated, and I could say I bought it in this particular bottle from so and so, would not this party—the man who sold me the honey with a guarantee of purity—deny that this honey was from him? and how could I prove that it *was* from

him, and that I did not adulterate it myself? Or suppose I buy from several people and mix all the honey together so as to make one grade—how can I prove afterward from whom the adulterated honey came? The dealer who sold the honey, whether he adulterated it or not, will, in case, of trouble, naturally want me to prove that this was his honey; and how can I do this? The only way I can see would be to have the honey sampled on receipt (each can or package), in presence of witnesses at the depot on arrival; then have it analyzed by a competent chemist; but such expense and loss of time would, of course, stop trade altogether.

I can not see the good of any guarantee, once the honey has gone out of control of the seller and passed into the possession of the buyer, and been bottled by him. The dealer may not know himself that the honey he sells is adulterated; or, if unscrupulous, he may adulterate it himself and give a guarantee of purity—knowing quite well that his buyer can not afterward prove the honey in a particular bottle or package is from him, or that the buyer has not adulterated it himself; consequently I expect that, in case of trouble, it will always in the end be the buyer that will have to suffer in case of conviction—I mean the man who puts up such purchases in small receptacles and sells it to the consumer or retailer.

Seeing the matter as I do, I am afraid to buy any honey. Am I wrong? and can you set me to rights and reassure me about the workings of this pure-food law?

Lake Charles, La.

[Our correspondent has given us a hard nut to crack—in fact, we have thought of the same thing. Almost every good law, if it is worth any thing, will work some inconvenience, perhaps hardship, upon innocent law-abiding people. Mr. R. states a condition where an honest bottler *might* be made to suffer for the rascality of some one else; but the national pure-food law has been in effect now for some fourteen months, and we have yet to hear of a case like either of those suggested by our correspondent.

Take the case cited: Suppose your bottled honey is pronounced adulterated and it is made up of one or more lots of honey from as many dealers. You should always retain a good-sized sample of each lot. Having done this you can have them all analyzed, and the one showing the adulteration would give you the means to place the blame where it belongs. With a guarantee of purity from the party furnishing such honey you would be cleared of all responsibility and Uncle Sam would proceed to prosecute the party who furnished you the adulterated lot.

Any bottler who does any extended business should be able to determine pretty accurately by the mere taste whether his honey is pure or not. Even if he does not have the knowledge to make such determination he should be careful to buy of honest and well-known honey-producers or dealers. When the honey arrives he should carefully sample by tasting of every can or barrel of

honey. If he tastes the honey and buys only of reliable people he will not be likely to run up against the national law, nor, in fact, any State law barring out adulterated goods.

But perhaps our correspondent would like to know how to detect glucose, the most common adulterant in honey, by the mere taste. Let him buy a small quantity of glucose of some confectioner, and then prepare several samples of honey and put into a part of them various percentages of glucose. First he should taste the pure glucose until he is perfectly familiar with its flavor. Next, in a day or so afterward or when the glucose taste is out of his mouth, let him taste the prepared samples. If he does not find himself pretty nearly unerring in detecting which is glucosed we shall be surprised. But suppose he finds his taste is *not* reliable. Let him take a sample of adulterated honey and pour over it a little alcohol and stir it. If glucose is present the honey will become cloudy. While this test is not entirely reliable, yet it will show if any considerable quantity of glucose is used.

In a word, the bottler's best protection is his knowledge of reliable dealers and producers, and his knowledge of good and pure honey when he tastes it.—ED.]

UNITING WEAK COLONIES IN THE SPRING.

On first thought, weak colonies could be united to advantage, but the many failures prove the fallacy of this plan. I have a plan, however, which has proven very satisfactory to me for a number of years—simply unite the weak ones with the very strongest. The strong ones can care for the little brood the weak one may have if it is placed close beside the brood of the strong one. This plan will save the weak ones very nicely, and especially where they may be too weak to be united on the Alexander plan. If two valuable queens come together, divide the brood equally with a thin wooden division-board with a double strip of zinc—one piece nailed on either side. That will prevent the queens from visiting each other.

I prefer the board $\frac{1}{4}$ or $\frac{3}{8}$ thick, with a hole $\frac{1}{2}$ inch wide by 5 or 6 long through the center, covered with zinc. Separate the colonies as soon as the hive is well filled with brood.

F. H. CYRENIUS.

Oswego, N. Y.

PASTE FOR LABELING TIN.

I notice in GLEANINGS for Jan. 15 that Mr. N. E. France recommends washing the surface of tin with soda or vinegar before put-

ting on labels with paste. I think I have a way of making paste that is easier and quicker. It is this: I take about a quart of boiling water and enough flour to make a thin paste. I mix the flour in a little cold water before putting it into the boiling water, and stir it until well cooked. I then put in one teaspoonful of powdered alum. Paste made in this way will stick labels to tin as tight as beeswax; but it is necessary to label before filling the tins with honey. This paste will also keep for months. I have never had any trouble with the labels coming off from my tins. CHRIS. GRIMOLDY.

Owen Sound, Ont.

A SCHEME OF MANAGEMENT OF BEES FOR THE BUSY FARMER.

I should like to submit my case to you for advice. Two years ago I acquired a swarm of bees. I now have three in ten-frame hives, which I run for comb honey and pleasure. Now, I am a busy farmer, and don't want to increase any further or buy any more hives. How can I manage them to best advantage? JAMES C. WHITE.

Sewell, N. J.

[For a busy farmer we would unhesitatingly recommend running for extracted or chunk honey, tiering up the hives one above the other, giving the queen unlimited room for egg-laying and the bees for the storage of honey. If a large entrance be given at the bottom, and if the hives are two, three, and four stories high, depending upon the strength of the colony and the season, there will be very little swarming. The extracted honey bottled will bring a fair price at the local markets, probably giving as large a net return as comb honey, with far less expenditure of time and labor on the bees, when the farmer is the most busy with his farm-work. If he can not afford an extractor, let him cut the honey out of the brood-frames and sell it in bulk as it is done in Texas. If he is well known in the vicinity he will have no trouble in disposing of his entire crop.

The special feature of this large-hive principle, one tiered upon another, that should appeal to the busy farmer, is the comparative absence of swarming, and the fact that the honey can be taken off the hive at his leisure in late summer or in the fall.—ED.]

THE SACKET TRANSPARENT WRAPPER FOR COMB HONEY; FURTHER POINTERS FROM THE INVENTOR.

I have read with much interest Mr. R. A. Burnett's article in reference to my wrapper, in the Jan. 1st issue, page 39, and would like to state that I experimented a great deal with the same before using or sending it out. The heavier the paper is, the less transparent; and to be of any value it must show to the purchaser just what grade he is getting. In fact, I had No. 1 grade, and with some of the paper I tried I found it did not show the true goods; and I found that, although heavier, it did not add very much to the strength.

As for the envelope or bag idea I had a couple of New York envelop concerns try to make up a bag that would be the exact size of the section. This did not work, because the section was not always perfectly square, while the bag was. By this I mean the section before filling was true enough; but when squeezed in the super it was a trifle out, and in inserting the box it tore the wrapper.

Another point was that a bag large enough to take almost any section did not fit tight, and looked messy, and, to my way of thinking, the beauty of the package is its neat appearance, and to have the paper stretched tight with no wrinkles.

I have yet to receive a complaint that the package did not carry well, and that, on account of leakage, other sections were soiled. The paper has the strength, and still has transparency. H. A. SACKETT.

East Orange, N. J.

SEALED COVERS VERSUS ABSORBING CUSHIONS; SEPARATE OUTER CASES USED THE YEAR ROUND.

I don't often contradict editors; but on p. 1312, Oct. 15, in answer to the question, "Are sealed covers better than absorbent cushions?" you say, "Yes." Permit me to say, "No!" An absorbent cushion will never get damp if a little space is left between the cushion and the cover of the hive. If super covers are put over brood-frames and sealed tight by the bees you can find damp musty combs almost any time.

I use ten-frame Dovetail hives and regular supers. The bottom-board is simply a flat board with a wedge under each side of the hive to regulate the entrance. This bot-

WEDGES USED TO CONTROL THE SIZE OF ENTRANCE.

tom-board is made with a little projection in front for alighting-board room.

To prepare the hives for winter I make a case 22×26×20 inches high, and a gable cover out of cheap box boards, and cover it with well-painted canvas or tin, or any thing that will keep out the water. I put an empty super on the hive, and over the frames a piece of straw matting or old carpet is put on, separated from the frames by a Hill device. I fill the super with cork dust, chaff, planer-

shavings, or sawdust; but the last two, if used, must be dry; or if a cushion to fit the super is preferred, the space around the sides of the hive should be filled up, and the colony will be ready to swarm by the first of May.
Jersey Shore, Pa. L. E. SCHERER.

[You say "absorbing cushions will never get damp between the cushion and the cover of the hive." There must be a great difference in localities, for here at Medina we tested this thing for over thirty years. Before the sealed-cover idea came to the front we had a great deal of trouble with wet cushions, especially during spring. In every one of these cases there was a large amount of air-space between the cushion and cover; and, besides that, there were means for ventilation in the cover itself. During late years we have adopted the sealed cover—that is, a thin board placed right on top of the brood-nest, which the bees seal down. Over this is placed a tray containing packing or cushion. Since adopting the sealed cover we do not find it necessary to pull out the cushions and dry them on warm sunny days; but with the old absorbing cushions we used to have them wet by the hundreds, and sometimes frozen.

We then conducted a series of experiments, putting half the bees on absorbing cushions and half under sealed covers. As our older readers will remember, the latter came out ahead.

Our own experience here at Medina is not the only one, for we often receive letters from our readers who are having the same trouble with wet cushions under a sealed cover; and these cushions are not wet because there is no space between them and the hive, either.—ED.]

DISINFECTING INFECTED COMBS WITH FORMALIN GAS.

In anticipating the work in the apiary the coming season, some of us are reminded that the germs of foul brood have been lurking around among our bees, and that we must take every precaution to defeat them in further destruction.

As for myself, I have several hundred empty extracting and brood combs, all of which are entirely free of honey, brood, and pollen, and which are dry, and have been so for a year. Some of these combs have had black or European foul brood in them, but, to the naked eye, are as bright and clean as any comb can be.

In the *Bee-keepers' Review* for 1904, page 152, Mr. E. W. Alexander gives a method of formalin fumigation which he says was quite successful in saving European (black) foul-broody combs, but *not* American foul-broody combs. Three years have passed since Mr. Alexander wrote his experience, and I should like to ask whether such treatment is recommended now as being successful.

I also notice a statement by Mr. Adrian Getaz, *American Bee Journal*, 1907, p. 689, as follows: "The experiments made a few years ago by Dr. Howard show that the spores

of the foul-brood bacilli do not resist the sunlight and open air more than a day or two. That explains why the hives contaminated do not need disinfecting. The spores they contain are soon destroyed by being exposed to the open air." Is this the accepted theory? and if so, why would not the spores of black brood be dead that have been on these perfectly dry combs for a year that I speak of above? I have melted up all combs that were badly diseased, or that contained a single cell of brood or pollen; but I do not want to melt these nice dry combs if fumigating will answer, and I do not want to fumigate if a year's airing and drying have killed the spores. WALLACE MAYS.

Benton Harbor, Mich., Feb. 6.

[The use of formalin for disinfecting combs, and even suspected diseased brood, was discussed a couple of years ago in all the bee-journals. Some favorable results were recorded, but there were enough failures to lead us to believe that it was not wise to depend upon such means of disinfection; but we see no objection to applying the fumes of the gas upon clean dry combs such as you speak of; but such combs should be confined in a hermetically sealed box or chamber. An ordinary wooden box with a lid is not tight enough. If a wooden chamber be used it should be made close enough to hold water. Then the gas should be applied full strength for the time prescribed.

We doubt if the formalin gas would disinfect combs affected with the American (old-fashioned) foul brood, for the reason that the dead matter clings to the sides of the cells like so much glue. The microbes under this covering can not be reached by the gas, and hence it would be a waste of time to employ it on such combs; but we think it might be applied to advantage upon those which possibly have been in hives contaminated with European foul (black) brood.

We would not, in the case of hives that actually contained infected colonies, rely upon the air treatment for disinfection. It is the work of but a few moments to throw a lot of loose dry straw into a hive, set fire to it, then stir the straw while ablaze, so that the flame reaches every portion of the hive as well as the cover. The moment the flame blackens the wood in every portion, throw in a cup of water and clap on the cover. We know that sunlight and air are wonderful germicides; but in the case of a disease so serious as American or European foul brood we would advise disinfection of the hives as above stated.—ED.]

HOW TO LIQUEFY BULK COMB HONEY IN PAILS.

On page 88 Louis Scholl says he can not melt chunk honey in pails after it is granulated, without melting the combs. I sell all of my comb honey in friction-top pails, and when cool weather comes the extracted honey that is poured over the combs will granulate. To melt this I set the pail of honey in a large pan of warm water. The water must

be so I can just bare my hand in it and no hotter, or the combs may be melted. I keep the water at the right temperature. The pan should be deep enough so the water comes up close to the top of the pail. We have melted lots of honey this way, and the combs were just as nice as ever. A thermometer would be a good thing for this.

Velpen, Ind. W. T. DAVIDSON.

[Although we have never tried liquefying bulk comb honey, it would seem to us that the warm-air method mentioned on page 145 of the Feb. 1st issue would prove very satisfactory. There would be no danger, certainly, of melting the combs at a temperature of 100°. See "Bee-keeping in the Southwest," in this issue.—Ed.]

HOW TO PUT A NEW SPRING ON AN OLD SMOKER-VALVE.

Get a piece of old watch-spring, about three inches long, which can be obtained from almost any jeweler. Lay this spring flat on the outside of the bellows-board, with the bend at *d* projecting into an awl-hole at *a*; 1

and 2 are staples; 3 is a staple or small bent wire nail driven only part way down. Properly put on it will bring the valve up with a snap. If the opening in the board were covered with a piece of wire cloth well tacked on it would keep little fingers from spoiling the valve in the first place. S. S. LAWING.

Ozark, Mo.

[We believe this idea is a good one; but we think that the solution of all valve trouble is no valve. The time is past when such a nuisance as a valve is considered necessary in a smoker bellows.—Ed.]

COMB HONEY PRODUCED WITHOUT SEPARATORS; BEES WORK MORE READILY IN THE UNOBSTRUCTED SUPERS.

In the Dec. 1st issue, page 1503, is an article from J. E. Hand which I wish to endorse in regard to the question, "Are separators a hindrance to the bees?" From my experience of several years I answer most emphat-

ically, *yes*. I learned by using hives with separators alongside of those without them, and I obtained more honey from the non-separator supers than from those with them; i. e., in many instances the bees refused to work in the separator sections, while those without filled every section. The hives of equal population with shallow extracting-frames produced more honey than those with the $4\frac{1}{2} \times 4\frac{1}{2}$ sections with or without separators. This proves to me that, the more the bees can work all in a cluster, the better. I have a few hives of some old pattern, the super of which takes a section $5 \times 5\frac{1}{2}$, and the bees seem to like these better than a smaller section. I use no separators, and have but few ill-shaped sections. Of course, I use full sheets of comb foundation or three-cornered starters. In fact, I get so much more honey from these old hives than from the new ones with the $4\frac{1}{2} \times 4\frac{1}{2}$ sections that I have concluded to discontinue the use of the latter.

Lorena, Texas.

D. F. MARKS

FRAME-HANDLING; CLIPPING; INTRODUCING THROUGH THE ENTRANCE.

I read the article on page 835 of the June 15th issue, 1907, on handling Danzenbaker frames, and wish wet cloths had been mentioned to spread over the top of the hive, as described in Danzenbaker's book. This I consider almost as valuable as the smoker. As you lift one frame after another, the cloth can be turned back, keeping the bees practically out of the way. A very little smoke blown under one of these covers goes a long way. When ready to close the hive, lift the cloth quickly, and before the bees are much in the way you can have the cover on.

I notice considerable discussion of hive-stands. I use what I saw described in an old number of GLEANINGS—simply three pieces of inch board nailed together in the form of a letter H. This is the cheapest, most portable, and convenient stand I have seen described; keeps the hive dry, up out of the way of toads, etc. The objection might be made that hives could not be tipped up on the bottom-board; but on the rare occasions when this is desirable it can easily be done by shoving the hive forward a few inches on the bottom-board. This gives only four square inches of contact with the bottom-board, doing away with moisture and rotting as nearly as it is possible to, which should make it appeal to Dr. Miller.

I notice many elaborate descriptions of the proper way to catch and hold a queen for clipping. Why catch her at all? I take in the left hand one end of the frame, rest the opposite corner on some solid support, follow her quietly and carefully around with the point of a pair of scissors in the right hand, and, as she pauses, nip off the wing—right wing for even years, left for odd. If a person's hand were not steady enough for this, I imagine a small rubber band lightly stretched between the prongs of a stick would hold her against the comb satisfactorily.

Here is a method of introducing queens I

have not seen mentioned. It is simple, and does the whole thing with one operation, even without opening the hive under certain conditions: I have flat cages (something like the Miller), closed by a cork like plug. When ready to introduce I remove the plug and lay the cage on the bottom-board (I have not found it necessary to place it up among the frames), with the entrance or opening to the cage close up against the side of the hive or bottom-board. Provide a small wire attached to the other end of the cage communicating with hive-entrance; and when you judge she has been in the hive long enough to be accepted, pull the wire lightly, which will drag the cage away from the side of the hive, thus leaving the cage-hole open. If thought desirable a little candy-honey dough can be inserted in the opening of the cage at the time of introducing, which the bees will not be able to get at until you change the position of the cage. This is the only method I have used, and have never lost a queen.

I have only a few colonies and limited experience; but as the above plans have worked satisfactorily with me I give them for what they are worth.

C. B. LOOMIS.

Albany, N. Y.

[Mr. Fr. Greiner, a short time ago, illustrated his method of clipping queens' wings, which was, to clip them on the comb. The method is all right if one has steady nerves, and precision as well as celerity of movement. We should suppose that the average person would be as likely to cut off a leg as to clip the wings while doing the act.]

The method of introducing queens as you describe would be excellent during the warm part of the year. It could not, of course, be employed during cool weather.

It is possible that the bees of a strong colony might push or crowd the cage themselves, especially if they should be at all hostile toward the queen. This would let her loose among the bees, where they would make short work of her.—ED.]

CAN A VIRGIN QUEEN BE USED ON THE DUAL-QUEEN SYSTEM?

So much has been said in GLEANINGS the past few months in regard to the double-queen system that it leaves one at a loss to know whether there is any merit in it or not. But I wish some correspondent who has had experience would kindly tell me if I can keep, during a light honey-flow or by feeding, a laying queen in an upper story, separated from the lower story by perforated zinc, and introduce a virgin queen to the lower story and allow her to become fertilized. If so, how long can I keep her there?

Merrill, Iowa.

J. R. THOMPSON.

[We see no reason why the plan here proposed would not work. Will some one who is in position to know please enlighten our correspondent? The only question arises as to whether a virgin queen would be treated on a par with a laying queen above the perforated zinc. We think she would; but if

any correspondent thinks otherwise, we should be glad to have him speak up.—ED.]

STORES OF HONEY FOUND BELOW THE BROOD.

Having read with interest the discussion between J. E. Hand and Dr. Miller, p. 1488, I wish to state that I at one time had considerable experience with bees putting stores below the brood when "unrestricted by the hand of man." A carpenter friend and myself were called upon to remove a colony of bees from the side of a two-story house. The bees were occupying several spaces between the studding, and for a height, in part of them, from the plate to the bottom of the window, and two combs thick. You will see from this that they were very strong. They had brood, as I now remember, from near the top down some two or two and a half feet, and fully two feet of honey below the brood.

Girard, Ill., Dec. 14. CHAS. M. GATES.

[Perhaps the entrance was at the top. See page 102, Jan. 15.—ED.]

A MODIFICATION OF THE WELLS SYSTEM.

Why not put a wire-cloth division board in the center of a ten or twelve frame hive, with a queen on either side; then an excluder below the super? That would give plenty of brood, stop swarming, and may be they would not kill one of the queens.

Jonesboro, Ind.

C. A. NEAL.

[The plan here spoken of would be a modification of the Wells system, and at the same time something similar to some of the schemes for two queens. It would probably work so long as the colony was in a prosperous condition; but after the honey season one of the queens probably would be missing. Try it, and report.—ED.]

IN THE CELLAR OR OUTDOORS?

Would it pay to winter bees in a cellar when they could have flights every few weeks through the winter, and sometimes every day for a week at a time if wintered outdoors?

W. P. HARPSTER.

Florence, Kan.

[If your locality is such that the bees could have a flight every few days through the winter we should not think it would pay you to attempt to winter them in a cellar, as the temperature would very likely be such that they would be very restless. With suitable packing we should say that outdoor wintering would be best for you.—ED.]

WIRING FRAMES BY THE AID OF A LARGE NEEDLE.

Perhaps the following may be of value to some of the readers of GLEANINGS. I find that, in wiring frames, by threading the end of the wire about an inch through the eye of a blunt-pointed needle of proper size I can work much faster than without.

Forksville, Pa.

W. L. NORTON.

SOUTHWEST FLORIDA—ITS OBJECTIONABLE FEATURES.

Mrs. Root declares that, while I mention and even dwell at length on the pleasant things to be found in this land of sunshine and perpetual summer, there are some disagreeable things I pass over entirely, and no doubt she is, at least to a certain extent, right about it; and I have promised in this talk to give a truthful glimpse of all these objectionable things I can think of.

A good many have inquired more or less anxiously about mosquitoes, and I am glad to say that here in Bradentown I have never seen any worth mentioning from the 5th of last November up to the present date, Feb. 20. There have been a few evenings when Mrs. Root not only *heard* a mosquito buzz, but I believe she actually found may be half a dozen, all told, so she killed them with a folded newspaper. While down on our island near swampy places we found them a few times quite troublesome; but I do not remember that they ever came up around our cottage so as to annoy us. Little gnats, almost too small to be visible, and so small as to get through window screens, are at times, during damp warm weather, quite vexatious, especially when you happen to be too busy with hands and eyes to give them your attention. When we first moved into our new house there wasn't a house-fly to be seen, and none came for quite a few days. The neighbors assured us, however, that, in due time, especially after we commenced cooking, they would be around. Sure enough, they did come, and for a few days almost drove Mrs. Root frantic. I said:

"Now, Sue, don't get so excited about a few flies. The weather will soon turn cold again, probably; and if it doesn't we will get some fly-paper and give them such a regular fight all round they will conclude this isn't a healthy place for flies."

Let me tell you something here. You can get rid of all sorts of domestic pests, rats, mice, flies, fleas, and even coons, 'possums, and *polecats*, if you go at it with enough energy and vigor. Let them know you mean *business*, and then "go in" and fight them to extermination. We got the fly-paper and caught them until there wasn't standing room on the paper for another fly. We killed them with "fly-slappers," and still they came; and Mrs. Root said, "I told you so." Then I declared something was baiting them. You bee-keepers know that bees will never stop robbing as long as they find a drop of honey (sticky doorknobs and the like). Well, it is just so with flies, and I declared something must be baiting them around a

certain back door. We keep our food in a wire-cloth-covered safe on the back porch in the wood-shed, and she remarked that she was surprised to find flies coming out every time the door was opened. Investigation revealed that this safe was so poorly made that flies were crowding in under the edges of the wire screen. A few tacks and a thorough going over stopped that "baiting." Then when a cool night came, very early in the morning with a brush-broom I killed every fly "roosting" around that safe and back door. Every morning I found fewer and fewer, and soon we both forgot all about the flies until the matter happened to be mentioned, and then we both wondered, because there was not a fly to be found, and it was then *my* turn to say "I told you so."

Now, my friends, this war of extermination will work with all sorts of "vermin." Don't say you haven't time, for it is really a great saving of time. Do you suppose I could write these Home papers with flies crawling over my hands (and bald head), and coming back and *back again*, when I tried to chase them away? As for myself, I greatly enjoy coming out ahead in all such fights. A home *isn't* a home, in the true sense of the word, when flies hold "high carnival" in every room and on all occasions.

Now I suppose I shall have to confess before you all something I didn't tell even Mrs. Root about for a long while. I think I did tell you that our one acre of land runs from the road, in front, back a little more than 100 yards to a bay or creek that juts out from the Manatee River; so we have a little piece of salt water at the lower end of our garden, where there are oysters and salt-water fish. When the tide went out one day, Raymond Rood, 11 years old, caught a fish with his hands that made a nice supper for the whole family. Well, one night after I first took possession of my place I thought I would have a bath in salt sea-water on my own premises, without saying a word to anybody. A rotten stump stood on the grassy bank close to the edge of the water, and I said, mentally, "Now, that stump will be just *the* thing to hold all my clothing and keep it nicely out of the dirt." I remember, too, thinking that, as things were so extremely handy, I would take a salt-water bath almost every day. No, dear reader, that was over three months ago; and, to tell the truth, I haven't had my *second* salt-water bath yet. In fact, I have scarcely gone near that part of my premises, *especially* that particular *rotten stump*. It makes me feel sad even yet to think of it. I took my bath Saturday night. Monday morning I confided the matter to Mr. Rood, and explained things by showing him one of my ankles.

"Red bugs!" he ejaculated; and after a little questioning I told him about laying my clothes on that rotten stump. A little later I was itching all over so it took all my time and both hands to scratch the place that itched the worst. Another day, the places I had scratched were scabby sores, and any part of my body, almost, would

have made a splendid picture for a medicine almanac—the kind where they say “before and after” taking their medicine. Mr. Rood and other friends told me to “stop scratching”—let it alone, and it would soon cure itself. It made me think of my time-honored remedy for bee-stings; viz., “after the sting is removed, don’t touch it or think of it, but ‘get busy’ about something else.” There are a multitude of remedies, and I went to the drugstore and asked for the best thing; but my colored boy, Charlie, gave me the most sensible remedy of all. He said if I rubbed a little coal oil on my ankles, where they usually get on you first, when in the woods, the bugs would keep away; for all insects dislike coal oil or the smell of it.

The man who built our chimney said that rubbing the oil around the tops of your shoes would keep them from getting on your body when walking in the woods.

Now, here is something very funny about these insects. The people who *live here* are seldom annoyed by them. Raymond goes barefooted, with his trowsers rolled up, all through those woods, and wades in where I bathed, and yet the red bugs never touch him. It is mostly the new comers, or “tenderfeet,” who get in the fix I was. I had something similar when I first got on the island a year ago, and also when I first arrived in Cuba. If the Department at Washington has ever published a bulletin on red bugs, “jiggers,” etc., I should be very glad to see it.

There is no danger in walking through a beaten path or on a traveled road. The insects are said to be mostly on stumps or rotten trees, and new comers should be very careful about sitting down in the woods or even on the ground. One of our Bradentown ministers from the North thought he would go fishing, and he sat on the grassy bank, just as we do back in the old home. When Sunday came he was in a fearful plight. Think of stopping in the midst of your sermon to scratch—well, say your ankle, when it has just “got to be scratched.”

When Mrs. Root came a month later I was very careful (and I thought very kind) to inform her that, before she went out in the Florida woods, she must anoint her ankles and shoetops with coal oil; but she very promptly declared she would do nothing of the kind, “red bugs or no red bugs.”* So far she has had only one or two evidences of them, and I have had no trouble since the first week or two. Mr. Rood declares we soon become *immune* to them as one does to bee-stings.

So far as reptiles are concerned, there are no more snakes here, if as many, as in the North.

During very dry weather the sandy roads are a drawback in many parts of Florida; but we have here in Manatee Co. very good roads most of the time, and beautiful roads are now being constructed all over the State,

especially near the towns and cities. Neglected farms, and poorly managed farms and gardens, are perhaps *more* plentiful than in the Northern States. I have sometimes thought the reason for this is that so many come here with the notion that profitable crops may be grown without steady hard work with both brain and muscle.

Early in the morning, when the dew is on, the black sandy soil sticks to your feet; and unless great care is taken it is tracked into the house and makes the floors very untidy, and entails lots of work. This is especially the case on new ground just cleared up. After your dooryard is covered with Bermuda or other grass, or after you have walks of wood or cement about the premises, this trouble is mostly over. There are usually very good grassy foot-paths all along the roadsides, especially along the out-of-town roads. During a dry time, when there are high winds, this same black sand blows or drifts into the houses, and calls for a deal of dusting on the part of the tidy housewife.

There, haven’t I done pretty well in giving the dark side as well as the sunny one? Mrs. Root’s greatest objection to Florida, after all, is that she can not *here* see the children and grandchildren every day by simply crossing the street; but, of course, this objection would apply as well to any locality on earth except the “old Medina home.”

By the way, *she* sometimes makes “great discoveries” as well as your humble servant. Her latest one is that the very best remedy for homesickness on earth is to go and find some other new comer who is also homesick, and in cheering him up and showing him your kind sympathy you both get over your trouble.* As there are quite a few bee-keepers with their wives now here from the North, she has done more visiting, especially among strangers, than she has for years past; and a part of her “discovery” is that not only are bee-keepers, as a rule, very bright, intelligent, nice men, but they seem to have managed in some way to get some of the *niciest* women for wives that there are in the whole wide world, and I think she is exactly right about it.

NEARLY 2000 new names have been added to our subscription list within the last month.

FOR the benefit of those of our readers who are interested in irrigated lands we wish to record the fact that the first stage in the immense Rio Grande project near El Paso, Texas, has been reached by the completion of the Leesburg diversion dam, in New Mexico. The big dam at Engle will next be proceeded with. The total cost of the project is now estimated at between eight and nine millions of dollars.

* If things come to such a pass that she must go round among people *smelling of coal oil* she would go back to “good old Ohio.”

* It just occurs to me that this is the Christian way of getting relief from all our troubles, and there is a beautiful text somewhere in the Bible referring to this very thing. Who will tell us where it is?

Let this Free Book tell you how to double your Potato Money

You can learn of the one way to plant your potatoes cheapest, how to save seed and soil, how to double the profit of every acre of your potato land.

You can get this book free for your name on a postal card. It will tell you all about the proper care of potato fields, proper methods of planting and cultivation, how to save hundreds of dollars in fertilizer money alone.

It will tell you how to do all this at a cost of but one dollar. It will describe the one planter that makes this all possible—the famous Acme Hand Planter. It will place in your hands all the great, vital truths of Potato Culture, condensed and plainly written, so it is easy to read and remember them.

You will want this book to put its precepts into practice on your own farm. Send for it now. Just say on a postal, "Send me your potato book."

Root Observation Hives for Nature Study.

At the present time the general tendency is to go to nature for our facts; and students of any phase of natural science are expected to rely on personal observation for the larger part of their knowledge.

For a thorough and intimate acquaintance with the facts of insect life in general or of bee life in particular there is nothing to be compared with a good observation hive such as we make. By careful observation the facts of bee life will be impressed on the memory in a way that shall never be forgotten; whereas if you trusted to books "it would go in one ear and out the other." Moreover, what you

made like good furniture, and nobody need be ashamed to have a hive on the window-sill of the sitting-room or parlor. They are excellent for showing to one's friends who require to learn *all about bees* in one lesson. Incidentally they help the sale of honey by interesting consumers in honey-bees.

THE COST IS SMALL.

As you will observe by the annexed price list the cost is small. In point of fact, we can suit the slenderest purse. Order one with your regular order for bee-supplies. You will not regret it. On the contrary you will be surprised that you did not have one long ago.

read in books is not always so. We make up these hives in a number of ways to suit various ideas and different-sized purses. In the end they all amount to the same thing—a considerable addition to our stock of real knowledge.

The CONSTRUCTION IS OF THE BEST.

We make no attempt, in making these observation hives, to reduce the cost to the last cent, because to do so would lead to dissatisfaction and failure. As a matter of fact they are

PORTER BEE-ESCAPES

HIVE ESCAPE

When taking off surplus this is the greatest saving device. It does away with the shaking of the heavy supers, the cruelty of excessive smoking which causes the bees to uncap their honey and start robbing. Just tip the super to the angle of 45 degrees and insert the board. In a few hours it is free of bees; then take off your super. You can as well afford to be without a smoker as without the Porter Bee-escape.

PRICES

Each, 20 cts.; dozen, \$2.25; postpaid. With board, 35 cts. each; \$3.25 per 10; by express or freight.

TESTIMONIALS

They are perfect in action.—British Bee Journal.

No bee-keeper can afford to be without them.—Prof. Cook in American Bee Journal.

Worthy of highest commendation.—Eugene Secor, judge on awards, World's Fair, Chicago.

I would not do without them even if they cost five dollars apiece.—W. Muth-Rasmussen, Independence, Cal.

They are absolutely perfect. I can not tolerate my own make since using them.—John S. Reese, Winchester, Ky.

They are one of the best things ever brought into any apiary, and should be used in every bee-yard in the whole world.—Wm. McEvoy, Foul-brood Inspector, Ontario, Canada.

There is no robbing or fighting or disturbance in the apiary when the surplus honey is taken off with them. They are simply perfect.—W. Woodley in British Bee Journal.

HOUSE ESCAPE

To be used over the doors and windows in the extracting-house, or any place you wish to clear of bees. The most persistent robber can not return. Some bee-keepers make a practice of taking off the filled supers and stacking seven or eight in a pile. The Porter Honey-house mounted on a board makes the best kind of escape. Don't wait till to-morrow before you get a supply. You can not afford to be without them longer.

PRICES

Each, 25c; dozen, \$2.75; postpaid.

TESTIMONIALS

The Porter bee-escape clears the supers of bees so perfectly and quickly and easily that it makes the taking off of honey a pleasure instead of a dread as in former years.—G. M. Doolittle, Borodino, N. Y.

The removal of full honey-boxes has become an amusement since we began using the Porter bee-escape.—Ed. Bertrand, Editor Revue Internationale d'Apiculture, Nyon, Switzerland.

This number of the Review contains more unqualified praise of the Porter bee-escape than any other issue has ever contained of any other implement; but so long as it is deserved, who cares?—Bee-keepers' Review.

They are the greatest thing on earth for expelling bees from supers.—G. J. Flansburg, South Bethlehem, N. Y.

I would not be without them for four times what they cost.—Dr. W. A. Tufts, Musson, La.

Undoubtedly the best bee-escape is the one invented by R. & E. C. Porter.—W. S. Pouder, Indianapolis, Ind.

Bee-men are certainly behind the times if they can afford to use them and do not.—M. H. Mendleson, Ventura, Cal.

The Hand System

TO satisfy a number of customers we are now making hives to suit the above system, just as the inventor himself uses them. These are not listed in our regular spring catalog, and are not kept in stock at any of our agencies. All orders will be filled from Medina. If ordered early enough, however, they can be forwarded to any one of our branches for redistribution. If you are going to try a few of these hives the coming season, we earnestly urge you to order early before the rush season comes on.

PRICE LIST OF HAND DIVISIONAL HIVE AND PARTS.

We have had numerous calls for divisional hives just as Mr. Hand uses them. We will not list them in our catalog for the coming season, but will make them up to supply on special order, to those who desire to try them, at prices in table below. The outside dimensions being nearly the same as the regular Dovetailed hive, the regular covers and bottoms may be used.

Each section is 19½ in. long, 5½ in. deep outside; upper portion of side removable with clamps to hold it in place. Sections used are 4¼x4¼x1½ plain, split three sides. Furnished in both eight and ten frame size.	Designating or Short Name	Nailed and Painted Each	In Flat

"Seaboard Magazine" ^{SIX} SOUTHERN STATES SEABOARD'S TRONCHOLD Free Sent A MAN'S DISPOSITION

is, without doubt, seriously affected by the climatic conditions which surround him.

ARE YOU PLEASANTLY LOCATED?

Are you shut in by the ice and snow of a rigorous winter, with naught but a cheerless sky to gaze upon? What of your lands now? Covered with snow? How about your stock? Have to be kept housed and fed?

The climate in our territory are plowing, their stock grazing on the hillsides, and in the famous Manatee section growers are shipping their products to Northern markets, receiving remarkable prices for the same, due to the season.

Our lands are just as fertile as yours, produce just as much and at a time when prices are the best. It's a duty you owe yourself and family to look into this.

CLIMATE IS A MOST IMPORTANT FACTOR in connection with the profits, as well as pleasure, to be derived from your location.

Wouldn't you like to be pleasantly situated, surrounded by climatic conditions which permit work to be carried on the entire year, and where the struggle for existence against the elements of a frozen North is not known?

The climate in the six States traversed by our line is unsurpassed anywhere, and the profits being derived by those who only a few years ago were battling with the rigors of winter in a northern location is evidence of the value of our lands. Do you expect to remain where you are and keep up the struggle? Why not come down into southern sunshine and be pleasantly located, while at the same time you are deriving big profits from your crops!

OUR LITERATURE IS FREE. The "Seaboard Magazine," prepared especially for the benefit of parties contemplating a change of location, will help you. Let us put your name on our mailing-list. Drop us a postal to-day.

J. W. White,
General Industrial Agent,
Seaboard Air Line Railway,
Dept. F, Portsmouth, Virginia.

Clover seed has still further advanced. We can not quote any firm price here. Write for price if interested.

BEEES AND QUEENS.

The season promises to be a good one for the early delivery of both bees and queens, and there is considerable activity in inquiries and orders, especially for high-grade stock. Our apiarist will begin making selections within a short time; and, to secure a good selection, the earlier you order, the better the chance will be for getting something extra fine. We have breeding-queens at \$6.00, \$9.00, \$12.00 up. Our stock is mainly the three-banded or leather-colored Italians. We ship either by mail or in nuclei as desired.

MAPLE SUGAR AND SYRUP.

We have had so far the promise of a very good season for maple products. Our readers will remember that Ohio maple is unsurpassed, and is much sought for by large buyers all over the country. We handle first quality only, and quote subject to market changes as follows:

Maple syrup in one-gallon square cans at \$1.15 per gal.
6 one-gallon cans in a case, \$6.60.

Maple sugar in less than 50-lb. lots at 15 cts. per lb.
50 lbs. and up, 12½ cts. per lb.

In order to secure first run, orders should reach us immediately after the receipt of this notice.

NEW TAPER-PANEL HONEY-JARS.

We show here an illustration of a new style of honey-jar holding half a pound. It is a taper-panel jar with lacquered tin cap lined with waxed paper wad which turns on tight with a one-fourth turn, warranted to hold airtight. We expect to have ready soon the one-pound size of the same style jar. Packed in reshipping-cases of two dozen each, ready to ship again, when filled, without additional packing.

Price ½-lb. taper-panel jar, 80 cts. per case; 6 cases, \$4.50.

Price 1-lb. taper-panel jar, \$1.00 per case; 6 cases, \$5.70.

Put up in crates of 2 gross, ¾-lb. size, \$3.75 per gross.
Put up in crates of 1 gross, 1-lb. size \$4.80 per gross.

SIMPLEX HONEY-JARS.

The factory have assured us that we may again secure this popular honey-jar in several sizes, including the one holding one pound of honey. We have ordered a fresh supply, but do not expect to have them in stock till next month. They will be packed in reshipping-cases of two dozen each, and the price will be \$1.10 per case; 6 cases, \$6.30.

NO. 25 HONEY-JARS.

During the past year we have had an unusual amount of trouble with breakage of this jar, even in the reshipping cases packed with corrugated paper. The breakage occurred either in the porcelain cap or the top rim of the jar where the cap rests. We find we can get this same jar with lacquered tin cap without the center being cut out. This cap is lined with waxed paper wad, which seals tight on the top edge of the jar. This style of cap not only does away with breakage almost entirely, but enables us to furnish the jar at a lower price. We are not yet supplied with the new stock, but expect to have them next month at the following price. They will be packed as usual, two dozen in reshipping partitioned cases. No. 25 jars,

tin cap lined, 90 cts. per case; 6 cases, \$5.10. We can still furnish from stock the usual style of No. 25 with porcelain caps at \$1.10 per case; 6 cases, \$6.30.

A NEW SIZE OF SECTION.

There seems to be a demand in some localities, where bees are inclined to daub with propolis or otherwise discolor the wood in sections for a wide frame completely enclosing the sections. Our regular supers are adapted to the regular sections in section-holders without a top-bar. To provide a top-bar as well as a bottom it is necessary either to make the super deeper or the section shorter. In order to use the regular deep super we have decided to make a new section, 4¼x4¼x1¼ or 1½ plain, no beeway. This will be used in a section frame hanging by top-bar in the regular deep super, interchangeable with the shallow Hoffman frame 5¾ deep. This will necessitate a new fence adapted to this size of section, which will be designated by the letter N. The 4¼x4¼x1¼ will hold a full pound, and will work best in the eight-frame super, 24 to the super. In the Danz, width (16¼) ten-frame super the 4¼x4¼x1¼ will fit best 32 to the super. These sections may be split for inserting foundation by the Hand method, and the correct size of sheet for that purpose would be 4¾x17½. Price of N section-frames, \$2.50 per 400 in flat. Price of N fences, \$2.00 per 100. Sections 4¼x4¼x1¼ or 1½, same price as regular Danz, \$.75 per 1000, No. 1; \$.425 for No. 2. Unless you specify we will send frames and sections 1½ wide, and supers fitted with the same. Deep super fitted with N section-frames, N fences and springs, either 8 or 10 frame, will be designated 2 N 8. Price, nailed and painted, 70 cts. each; in flat, 55 cts.; 5 for \$2.50.

2 N 10. Price, nailed and painted, 75 cts. each; in flat, 60 cts.; 5 for \$2.75.

With sections and foundation-starters included.
4 N 8. Price, each, nailed and painted, \$1.00; in flat, 75 cts. each; 5 for \$3.50.

4 N 10. Price, each, nailed and painted, \$1.05; in flat, 80 cts. each; 5 for \$3.75.

With sections and full sheets of foundation.
1 N 8. Price, each, nailed and painted, \$1.40; in flat, \$1.00 each; 5 for \$4.50.

1 N 10. Price, each, nailed and painted, \$1.45; in flat, \$1.05 each; 5 for \$4.75.

These are not listed in our catalog this season, and not in stock with any of our dealers. If you wish to test them you will have to make special orders to secure them. You can get them through your dealer if you order in ample time and are not in a hurry to receive them. This section will require a new size of carton and a new size of shipping-case to put them up for market. We offer the new size for experiment this season to see if it has sufficient warrant for introduction into the catalog another year. By cutting beeways in the top and bottom they could be stored without fences or separators, and four could be placed in a shallow Hoffman frame for storing, though they would not be as well protected as in a section-frame. The latest style of shallow frame with ¾-inch ends would be rather scant in length inside to take four sections, but those made earlier would have room.

Convention Notices.

The North Texas Bee-keepers' Association will meet at Blossom, Lamar Co., Texas, on the first Wednesday and Thursday in April. All bee-keepers are invited to attend. Come on, and let's make it a grand time. Free entertainment is provided.

W. H. WHITE, Sec.

The Panhandle Bee-keepers' Association will meet in Knights of Golden Eagle Hall, corner of Jacob and 38th St., Wheeling, on March 25. Morning session at 10: afternoon, 1; evening, 7. The object of this association is to promote and protect its members. All bee-keepers are requested to attend. Ladies are cordially invited.

W. L. KINSEY, Sec.
Blaine, O.

The Central Tennessee Bee-keepers' Association will meet in the rooms of the Nashville Board of Trade on Saturday, April 25, at 10 A.M. A full attendance of the members is desired, as this is the regular annual meeting for the election of officers, etc. A good program has been arranged, which will include essays and discussions on subjects of interest to bee-keepers.

Franklin, Tenn.

J. M. BUCHANAN, Sec.

The seventeenth annual convention of the Connecticut Bee-keepers' Association will be held in Jewell Hall, Y. M. C. A. building, Hartford at 10:30 A. M. Apr. 9, for the election of officers and the transaction of any other business proper to come before the meeting. A program of unusual interest and value is being arranged, and no bee-keepers should fail to attend. The matter of organizing a fall fair, under the provisions of a State law, is to be considered, which will be of vital interest to the honey industry.

J. A. SMITH, Sec.

THE NATIONAL CONVENTION - AN IDEAL SPOT FOR IT.

The National convention has not always been fortunate in its place of meeting. Sometimes it has been held near a noisy, dusty street, where the rattling of trucks over stone pavements and the rumble of street cars would often entirely drown the speaker's voice. Again, it has been held in some hot close hall up two or three flights of stairs.

We have not always been thus unfortunate. Some of the meeting-places have been very comfortable, and well adapted to our needs; but never, in its forty-odd years of existence, has the National met in a place so ideally perfect as the one chosen for the coming convention, to be held next October in Detroit, Michigan. It is the pavilion, or sun palace, built by the Wayne Hotel almost expressly for the use of conventions. It is back of the hotel, away from the noise and dust of the main street, and extends down to the very edge of the Detroit River, where the traffic of the great lakes may be seen passing and re-passing at all hours of the day. At one side of the pavilion is a little garden, or private park, filled with beautiful flowers, trees, lawns, and walks. Upon the other side is Third Street, but it is paved with asphalt, which gives but little sound. Besides, the street ends at the river, and is not much used opposite the pavilion.

The pavilion is two stories high, and it is in the upper story where the convention will be held. The sides can all be thrown wide open, allowing the cool river breezes to sweep through; or the windows may all be drawn down if desirable. If the weather is cool enough to need it, steam heat can be turned on. In fact, we shall be able to rid ourselves of noise, dust, heat, or cold. We can sit at our ease, with the beautiful river at our feet, and the spires and chimneys and wooded hills of the king's domain (Canada) looming up in the distance.

Near the center of the pavilion, but somewhat to one side, is an inclosed space, perhaps forty or fifty feet across, the sides mostly of glass, and extending from floor to ceiling. In this will be a capital place to exhibit honey, wax, and supplies—near at hand, yet not right in the convention room, which sometimes causes annoyance.

All of these comfortable quarters will be free, with the understanding that we make our headquarters at the Wayne Hotel. The Wayne is a strictly first-class house—what some of us common folks might call high-price. It has an unusually large office, or lobby, with two fireplaces, or grates, as they are now called; marble floors and supporting pillars, with large leather-bound lounging-chairs and sofas—a delightful visiting-place for us between sessions. Every thing is quiet, orderly, and well managed. No more desirable stopping-place could be found.

What are the rates? They run from \$2.50 to \$4.50, American plan—that is, including meals; but here is the bargain that we have made: They will take care of 150 bee-keepers at \$2.50 per day, provided two will occupy the same room; and who ever heard of a bee-keeper at a convention who wished to be put off in a room all by himself? In order to give this flat rate for so large a number, many rooms will be used for which the charge is ordinarily much higher.

Of course, no one will be compelled to stop at the Wayne, as there are other hotels within two blocks where 200 people, extra, can be cared for at from \$1.25 to \$2.25 per day. In these times, however, it is difficult, in a large city, to secure really desirable accommodations for much less than \$2.00 a day; and when one has paid that much, besides several other dollars to reach the city, it seems foolish to allow a paltry 50 cents a day to stand in the way of joining the crowd and being "one of the boys."

One thing more: The Michigan Central and the Big Four railroad station stands just across the street from the Wayne, while the Union station, used by the Pere Marquette, Wabash, and Canadian Pacific, is only two blocks away. The Grand Trunk and the Lake Shore and Michigan Southern station is several blocks away—perhaps seven or eight—but it is easily

reached by street cars that pass the Wayne. The electric-suburban-car station is within easy walking distance—only four or five blocks.

The dates for holding the convention have been fixed on Oct. 13, 14, 15—at a time when the weather conditions in the North are usually ideal. The heat and dust of summer are past, and wintry blasts and snowdrifts are in the distant future.

W. Z. HUTCHINSON,
Flint, Mich., Feb. 10. Sec. N. B. K. A.

BEE-KEEPING IN HAWAII.

We have received the report of the annual meeting of the Hawaiian Bee-keepers' Association; but for lack of space we are compelled to abridge it greatly. The officers of the association are: President, A. F. Judd; Vice-president, T. V. King; Secretary, D. L. Van Dine; Treasurer, J. O. Young.

The former vice-president, Albert Waterhouse, presided. One of the main objects of the meeting was to hear the report of Secretary Van Dine on his trip to Washington to see Secretary Wilson with regard to the status of Hawaiian honey under the pure-food law. He reported the entire success of his mission. He had also taken the opportunity to make a study of the honey-plants of California with a view to the introduction of some of them, and in this he had the assistance and cooperation of the United States Department of Agriculture.

In company with Mr. J. M. Rankin, Special Agent in Apiculture at the Introduction Garden, Chico, Cal., he journeyed from Riverside to San Francisco. The principal honey-plant in Hawaii is the algarroba, or mesquite (*Prosopis Juliflora*); but to create a great honey industry more honey-bearers must be introduced. Mr. Rankin sent seeds of phacelia (two species), black sage, white sage, wild alfalfa, and horehound. He also recommended white sweet clover, but sent no seed.

The treasurer's report was read, which showed the association is sound financially. It was decided that all members whose dues were paid in advance should receive free a year's subscription to the *Bee-keepers' Magazine*. The matter of introducing new honey-plants was turned over to a committee. A number of new members were admitted.

Honey-cases for sale.

Two cans to the case. Both cans and cases in A-1 condition. Price 30 cents per case in lots of 100 cases or more. Write for price.

MICHIGAN WHITE-CLOVER HONEY CO.

Mr. Bee-keeper,

Was 1907 a POOR YEAR for you?

It was a GOOD YEAR for users of

DADANTS' FOUNDATION.

One dealer used 14,000 pounds.

Another dealer used 7,250 pounds. Another dealer used 4,500 pounds. Another dealer used 4,500 pounds. Another dealer used 3,000 pounds. Another dealer used 6,000 pounds.

Thousands of pounds sold to the bee-keeper direct, or worked up for him out of his beeswax.

The DEALER likes DADANT'S FOUNDATION because the bee-keeper likes it.

The bee-keeper likes it because his BEES like it.

The BEES like it because it is exactly like their own comb, so PURE and SWEET and CLEAN.

DADANT'S FOUNDATION is the Standard because it is the BEST.

Wax worked into foundation.

Send for our Supply Catalog.

JAMESTOWN, N. Y.

\$500.00 ACCIDENT INSURANCE POLICY FREE!

FARMERS' INSURANCE THAT REALLY INSURES.

You may have had other chances to buy accident insurance that would protect you in elevators, on steamboats, and automobiles, but this is the *first chance you have ever had* to get real protection in your ordinary work. This NEW \$500.00 POLICY was secured from the North American Accident Insurance Company, of Chicago, Ill. (Surplus \$331,498.66) the largest company in America handling this class of policies, after long negotiations. It took three months to induce the company to write the special features that were required to make it valuable for rural people. By buying the policies outright in very large quantities, it is now possible to offer it FREE with this remarkable practical combination of magazines.

GLEANINGS IN BEE CULTURE, \$1.00
the bee-keepers' favorite paper.

FARM JOURNAL (five years), .75
the standard farm paper of the world.

GARDEN MAGAZINE—FARMING, 1.00
a most beautiful, practical horticultural magazine.

INSURANCE POLICY . . . 1.00
\$3.75

All for \$2.

These magazines, if paid for separately, would cost you \$2.75, but we can sell ALL THREE MAGAZINES with the NEW INSURANCE POLICY for ONLY \$2.00. This is because the three publishers have combined for a subscription campaign. If each one sent you a separate letter it would cost us just three times as much as where we offer all three together. **THE SAVING GOES TO YOU.**

If the policy is not wanted we can substitute any of the following: "Designer," "Housekeeper," "Ladies' World," "McCall's Magazine," "Mother's Magazine," or the Garden and Farm Almanac.

WHY SHOULD YOU HAVE THESE PAPERS?

BECAUSE GLEANINGS IN BEE CULTURE is the great paper in America devoted to bees and honey. If you have bees, or are going to get them (and everybody who lives in or near the country should have bees), you need the most reliable and latest information, and you want at the same time the simplest directions possible. You want the bee business in a nutshell, and that is what GLEANINGS will give you. For the beginner or the most expert it is equally valuable.

BECAUSE FARM JOURNAL is far and away the foremost farm-paper in the world, a boiled-down, practical, helpful, entertaining monthly, built to make the rural homes of America more happy, prosperous, and contented, and already doing it for more than 500,000 homes. For farmers, villagers, or suburbanites.

BECAUSE the most beautiful garden and horticultural publication in the world is the GARDEN MAGAZINE, full of sound sense, beautiful engravings from photographs, and fine printing. It has ten issues at 15 cents each and two at 25 cents each, per year, and the subscriber gets his money's worth twice over. It is a delightful magazine, useful, stimulating, and ornamental.

WHY SHOULD YOU HAVE THIS INSURANCE?

Because you are in danger, every moment, of an accident which may cripple you for weeks, months, or for life; because the loss of an eye, a hand, or a foot, may mean destitution for yourself and your family; because this protection, for a full year costs you nothing whatever.

WHAT THE POLICY PAYS:

For Loss of Life.....	\$500.00
For Loss of Both Eyes, meaning entire and permanent loss of the sight of both eyes.....	500.00
For Loss of Both Hands, by actual and complete severance at or above the wrist.....	500.00
For Loss of Both Feet, by actual and complete severance at or above the ankle.....	500.00
For Loss of One Hand and One Foot, by actual and complete severance at or above the wrist and ankle.....	500.00
For Loss of One Hand, by actual and complete severance at or above the wrist.....	125.00
For Loss of One Foot, by actual and complete severance at or above the ankle.....	125.00
For Loss of One Eye, meaning entire and permanent loss of the sight of one eye.....	50.00

Provided such loss shall result within thirty days from date of accident, from accidental bodily injuries, solely and independently of all other causes, and covers accidents as follows:

Being thrown from a mower by horses.
Being knocked down in the road by a wagon or automobile.
Being hurt in a bicycle accident or collision.
Being hurt while operating corn-sheller, fodder-cutter, etc.
Being caught in a burning building, house, or barn.

Being hurt in an elevator or any public conveyance—train, trolley, boat, etc.
Being injured in a runaway.
Being frozen or frostbitten.
Being injured by robbers or burglars.

Should the Assured obtain injuries in the manner specified above, which shall not prove fatal, but which shall immediately, continuously, and wholly disable and prevent the assured from performing each and every duty pertaining to any business or occupation, the Company will pay the Assured FIVE DOLLARS PER WEEK during the time of such disablement, but not exceeding six consecutive weeks for any one accident.

NO DELAY OR EXAMINATION.

The insurance goes into effect as soon as you receive the policy and mail back the coupon attached to it. There are no dues, taxes, premiums, or assessments of any kind whatever to be paid by you. We have paid everything in full.

The three papers will begin at once, and will come to you each month till the time expires. **THEN THEY WILL STOP, unless you order them renewed.**

Send us \$2.00 by registered mail, or postoffice or express money-order to-day. Money refunded to any dissatisfied subscriber. Address

GLEANINGS IN BEE CULTURE, MEDINA, O.

Keep Dry and Comfortable

WHEN YOU DRIVE

Be snug and comfortable. Don't expose yourself to the elements. The "Sheltertop" Buggy will protect you on your drives. It's the first real improvement in buggies since the days of the "Deacon's wonderful one-horse Shay." The first buggy that ever afforded immediate and absolute protection to its occupants from rain, snow, mud, wind, dust—the only buggy with a top that closes up tight in a moment and actually shuts out every drop of rain, while at the same time it allows ample and thorough ventilation and a clear, unobstructed vision in every direction.

THE "SHELTERTOP" BUGGY

The top of this buggy is so constructed that this absolute and complete protection is always on the buggy—in fact, a part of the buggy—out of sight when not in use, right at hand when needed. Three simple, easy, one-hand movements—done in four seconds—close the buggy without leaving the seat, dropping the lines or stopping the horse.

When the storm is over, three movements change the buggy back again to an open, fair-weather buggy.

This is certainly the buggy for the farmer and the man who drives much. It makes a wet, blustering day worth almost as much as a dry one. You can ride in it to transact business at the neighbor's, or in town, as comfortably as you could in any other buggy on a clear, bright, dry day.

The improved top on the "Sheltertop" Buggy is actually lighter than an ordinary

buggy-top, looks better, and lasts longer, while it has none of its bad features. There are no bows in the way to bump the head against when entering or leaving the buggy. The door is clear, large and roomy. There are no doors to rattle or stick.

There are so many new and desirable features in the "Sheltertop" Buggy that we want you to know about, that we have decided to send it on 30 days' free trial to responsible parties to test before they buy it. Don't buy the same kind of a buggy your great-grandfather did when you can get this improved buggy. Your great-grandfather would not have bought the other sort if he could have gotten a "Sheltertop." He bought the best there was in his day. You should do the same now.

Send us your order, or write for catalog describing it, and be sure to ask for terms on which we send them free for 30 days' road test.

Write today for Free Catalog.

Apple Trees in Bloom.—A. I. Root's Orchard.

Published by The A. I. Root Co., Medina, Ohio, U. S. A.

Entered at the Postoffice, Medina, Ohio, as Second-class Matter.

THE OBSERVER APIARIAN LABORATORY

The Largest and Best-equipped Experimental and Scientific Apiary in the United States is located at Stamford, Ct. It is under the management and personal work of Edward F. Bigelow, A.M., Ph.D., "The Nature-study Man," well-known to all readers of *GLEANINGS IN BEE CULTURE*. This laboratory is well-equipped with experimental cages, apparatus, and appliances. It contains eight educational hives in four different designs (made by The A. I. Root Company). There are thirty-eight colonies at present under careful experiment and observation. In direct connection with the laboratory is a photograph gallery fitted with cameras and high-grade lenses, including a 6 1-2 x 8 1-2 photo-micrographic camera fitted with acetylene and oxy-hydrogen light, far beyond the power and scope of the ordinary laboratory. A sample of the work of this laboratory was "The Story of Honeycomb," published in *GLEANINGS IN BEE CULTURE* for August 1, 1907. To that article Editor Root had the following introduction:

"The following article by Professor Edward F. Bigelow, the nature-study man, lecturer, and one of the editors of *St. Nicholas Magazine* on the subject of honey-comb, its construction and development, is one of the best if not THE best that was ever written. The photographs are superb, and instructive as well as interesting. The article as a whole will be incorporated in the next edition of our A B C of Bee Culture, now in process of revision, and, later on, made the subject of a special booklet."

Other articles equally or more instructive and entertaining are now in preparation. Much of the work of this laboratory, in the future, will be published in

THE GUIDE TO NATURE.

Subscription, \$1.50 per year. Address: **Stamford, Connecticut**, for full particulars, including departments of pets, plants, travel, etc.

Honey Markets.

GRADING RULES FOR COMB HONEY.

FANCY.—All sections well filled, combs straight, firmly attached to all four sides, the combs unsoiled by travel-stain or otherwise; all the cells sealed except an occasional one, the outside surface of the wood well scraped of propolis.

A No. 1.—All sections well filled except the row of cells next to the wood; combs straight; one-eighth part of comb surface soiled, or the entire surface slightly soiled; the outside surface of the wood well scraped of propolis.

No. 1.—All sections well filled except the row of cells next to the wood; combs comparatively even; one-eighth part of comb surface soiled, or the entire surface slightly soiled.

No. 2.—Three-fourths of the total surface must be filled and sealed.

No. 3.—Must weigh at least half as much as a full-weight section.

In addition to this the honey is to be classified according to color, using the terms white, amber, and dark; that is, there will be "Fancy White," "No. 1 Dark," etc.

NEW YORK.—Market very quiet on comb honey as well as extracted. Our comb honey is fairly well cleaned up, but there is still considerable left, and unless the demand improves most of the lower grades, in all probability, will have to be carried over. While there is a fair demand for extracted, it does not compare favorably with former years, and it is almost impossible to sell large quantities. Prices remain about the same. Beeswax somewhat firmer and in good demand at from 29 to 31 according to quality.

HILDRETH & SEGELKEN,
265 Greenwich St., New York.

March 26.

ST. LOUIS.—Since our last there has been no improvement in the market for honey. Comb honey is especially dull. The stocks on hand, however, are small. We quote: Fancy white comb honey, 15 to 16; No. 1, 13 to 14; amber, 13 to 14; broken and defective, less; extracted, in cans, white, nominal at 8½ to 9; amber, 7 to 8; in barrels, 6½ to 7; granulated extracted sells at ¼ to 1 cent per lb. less. Beeswax is firm at 28 for prime; all impure and inferior, less.

R. HARTMANN PRODUCE CO.,
St. Louis, Mo.

March 20.

ZANESVILLE.—The honey market remains quiet, although if any thing there is a slight improvement, and also some stiffening in prices. No. 1 to fancy white comb brings wholesale from 18 to 21, according to quality and source. There is some demand for best extracted in glass packages for the retail trade. Beeswax is in light demand; would pay 30 cts. f. o. b. here in exchange for bee-supplies.

EDMUND W. PEIRCE,
136 W. Main St., Zanesville, O.

March 18.

INDIANAPOLIS.—Very little honey is now being offered by producers; and while our market is fairly well stocked the demand is slow, and indications are for a decline in prices. Jobbers are offering the following prices, delivered here: No. 1 and fancy comb, 16 to 17; extracted white clover, 9 to 10; amber in barrels, slow at 6 to 6½. Beeswax, 28 cents cash, or 30 in exchange for merchandise.

W. S. POWDER,
Indianapolis, Ind.

March 18.

KANSAS CITY.—The demand for comb and extracted is light, and receipts good. We quote: Fancy white comb, 24 sections, \$3.10 per case; No. 1 white comb, 24 sections, \$3.00 per case; No. 2 white comb, 24 sections, \$2.75 per case; white extracted, per lb., 8. Beeswax, 25.

C. C. CLEMONS & CO.,
Kansas City, Mo.

March 20.

CHICAGO.—There is very little demand for honey of any kind, and the supply is quite large; hence there is very little opportunity to make sales under the best conditions; but the general tendency in prices now is downward. Beeswax is steady at 28 to 30.

R. A. BURNETT & CO.,
Chicago, Ill.

March 19.

SAN FRANCISCO.—Honey remains quite firm at prices that have prevailed for some time. There is none of much consequence coming in at present, and with a limited demand the market shows no great activity. Water-white comb, 16 to 17; white, 15; water-white, extracted, 8 to 8½; light amber, extracted, 7 to 7½; dark amber and candied 5½ to 5¾.

Pacific Rural Press, March 14.

ST. PAUL.—Receipts are very light; demand moderate, and prices steady. The prices below represent those obtained for shipment in small lots. Fancy white clover, per lb., 18; fancy California, 24 combs to the case, \$4.00; strained, in 60-lb. cans, per lb., 10 cts.

W. H. PATTON, Sec. Board of Trade,
St. Paul, Minn.

March 23.

BUFFALO.—The demand here for honey is very slow—receipts more liberal lately. We quote fancy white comb, 16 to 17; No. 1 white comb, 15 to 16; No. 2 white comb, 12 to 13; buckwheat, comb, 11 to 12; white extracted, 8 to 10; dark extracted, 7 to 8. Beeswax, 30.

W. C. TOWNSEND, Buffalo, N. Y.

March 27.

LIVERPOOL.—Honey, steady, with Chilean, at 4 to 6½; Peruvian, 3½ to 5; California, 7½ to 10; Jamaican, 4½ to 4¾; Haitian, 5 to 5½. Beeswax from African, 29 to 30; Jamaican, 34 to 35; American, 30 to 33; West Indian, 29 to 32; Chilean, 30 to 36.

TAYLOR & CO.,

March 14.

7 Tithebarn St., Liverpool.

IT'S THE BEST EVER.

Think we are crazy about that bee-veil of ours, do you? Well, there are others. Copy of order received last day of February:

Denver, Col., Feb. 28, 1908.

Gentlemen:—Please send one dozen more of your MUTH BEE-VEILS. Send with the other order if not already sent.

Yours truly, THE COLORADO HONEY PRODUCERS' ASS'N.

That's the way bee-people order

MUTH IDEAL BEE-VEILS.

What's the reason?

Because these veils are DIFFERENT. Made of indestructible wire and strong cloth. Don't blow into your face; can't catch fire.

Cost 75 cts. postpaid; 70 cts. if ordered with other goods.

WHAT ARE YOU WAITING FOR? DON'T BE A TRAILER OR A DRONE. Send for one to-day, and you'll see why WE, as well as customers, think this veil IDEAL.

It makes good wherever it's used.

MEDINA, OHIO

READ WHAT EXPERTS SAY OF IT

The Christmas mail brought me what is probably as useful and beautiful a Christmas present as I ever received—a morocco-bound copy of the new edition of the A B C and X Y Z of Bee Culture. Bee books and journals have come to my desk of which it seemed as though the least said the better. Not so with this book. On the contrary, it seems as though words were lacking to do it justice. There are many other bee-books, each filling its niche, but, in all the world, there is nothing so comprehensive as the A B C and X Y Z of Bee Culture. There is no point in the wide domain of apiculture that is not touched upon in this volume, and the information is the very latest and most authentic, well written and well illustrated. The amateur and the expert are both served equally well.—W. Z. HUTCHINSON, editor and proprietor of the *Bee-keepers' Review*, and author of *Advanced Bee Culture*.

No bee-keeper's library can be at all complete without a copy of this magnificent apiarian work. It has reached a sale of over 100,000 copies already, being the most largely sold book on bees in the world. Better send to us for a copy to read during the long winter evenings.—*American Bee Journal*.

This work of 536 pages is, as its name implies, a complete cyclopaedia of every thing pertaining to bees and bee-keeping. It was originally compiled by A. I. Root, who in the 1877 preface, after stating his indebtedness to Langstroth, Quinby, and others, says that, "A great part of this A B C book is really the work of the people, and the task that devolves on me is to collect, condense, verify, and utilize what has been scattered through thousands of letters for years past." Since the first copy of this work appeared, now thirty-one years ago, it has undergone many revisions, and has had many additions, both of letterpress and illustrations, while the rapid advancement in bee culture has made it necessary in many cases to remove whole articles and rewrite them entirely. The revision has been ably carried out by E. R. Root, the present editor of *GLEANINGS*, who has had the assistance of a number of well-known and able men. In the preface the names of the writers of the different articles are given. For instance, we find Dr. C. C. Miller writes on honey-comb and out-apiaries; Dr. E. F. Phillips on the eye, parthenogenesis, and scent of bees; E. R. and H. H. Root on wax and wintering, both of these having carried out a number of experiments on these subjects. There are also articles by W. K. Morrison and Mrs. Comstock. It seems almost superfluous to say anything about a book of which already 100,000 copies have been sold; the simple fact speaks for itself that it fills a want, and is an attestation of its worth. Among the articles that have been revised we find the new methods of queen-rearing described, so that the practical bee-keeper will have the latest and best ideas on the subject before him for reference. The new methods of wax-production are treated in an exhaustive manner, and as this subject is of more importance than formerly, greater space has been devoted to it. We have nothing but good words for this work, and recommend our readers to get a copy of the 1908 edition. The work is profusely illustrated and beautifully printed, and is a credit to the publishers.—By T. W. COWAN, Esq., editor of the *British Bee Journal*. Mr. Cowan is the author of two first-class books on bees and bee-keeping, "The Bee-keeper's Guide," and "The Honey-bee."

BICYCLES TO THE FORE.

If you are interested in beautiful printed matter, we feel sure you will be delighted with the new catalog issued by the Meade Cycle Co., of Chicago. It is, undoubtedly, the handsomest bicycle catalog ever printed, and can not, of course, be scattered broadcast, owing to the cost of publication. However, we are happy to announce that, by special arrangement, every reader of this journal who is interested in bicycles may obtain a free copy by simply sending a postal card to the Meade Cycle Co., Chicago, stating that you are a regular reader of this paper. This concern, with its foreign branches, sells bicycles direct to the rider by mail, and has thousands of customers in all parts of the world. A recent inspection of their vast Chicago storage warehouse found them well prepared for the spring and summer rush of orders, with over ten thousand bicycles piled tier on tier on tier, crated and ready for immediate shipment.

A WONDERFUL TRANSFORMATION.

A great change is taking place in the manufacture of millwork for house-builders. One of the leaders in this great movement is the now celebrated firm of Gordon, Van Tine Co., of Davenport, Ia., whose advertisement appears elsewhere. Formerly the home-builder had to be content with what the local planing-mills were pleased to furnish—often, too, at exorbitant rates for poor workmanship. An examination of our advertising pages for the past few months will show the line of work to be expected from this firm to be the very best. Catering to a wide circle of buyers they furnish a home-builder with a wide variety of styles from which to make a choice such as no local mill can hope to equal. This kind of business is bound to grow until we shall be able to purchase ready-made houses and cottages made by automatic machinery. It looks that way, and it is but a question of time before we shall be in position to order a ready-made house as easily as we now order a ready-made overcoat. There are many reasons why such work can be done at a large factory better, quicker, and cheaper than it can be done locally. Write to the Gordon, Van Co., 674 Case St., Davenport, Ia., for convincing evidence.

SAVING

is more important than hard work.

Money deposited with us is secure and works for you continually. Our perfect system of Banking BY MAIL brings this opportunity to your door.

Root Observation Hives for Nature Study.

At the present time the general tendency is to go to nature for our facts; and students of any phase of natural science are expected to rely on personal observation for the larger part of their knowledge.

For a thorough and intimate acquaintance with the facts of insect life in general or of bee life in particular there is nothing to be compared with a good observation hive such as we make. By careful observation the facts of bee life will be impressed on the memory in a way that shall never be forgotten; whereas if you trusted to books "it would go in one ear and out the other." Moreover, what you

made like good furniture, and nobody need be ashamed to have a hive on the window-sill of the sitting-room or parlor. They are excellent for showing to one's friends who require to learn *all about bees* in one lesson. Incidentally they help the sale of honey by interesting consumers in honey-bees.

THE COST IS SMALL.

As you will observe by the annexed price list the cost is small. In point of fact, we can suit the slenderest purse. Order one with your regular order for bee-supplies. You will not regret it. On the contrary you will be surprised that you did not have one long ago.

read in books is not always so. We make up these hives in a number of ways to suit various ideas and different-sized purses. In the end they all amount to the same thing—a considerable addition to our stock of real knowledge.

The CONSTRUCTION IS OF THE BEST.

We make no attempt, in making these observation hives, to reduce the cost to the last cent, because to do so would lead to dissatisfaction and failure. As a matter of fact they are

A GREAT "LITTLE" INDUSTRY.

A very handsome and most practical book has just been issued by the Reliable Incubator and Brooder Co., box 49, Quincy, Ill. Even the most experienced poultry-breeder would find this of interest; and of course, to the inexperienced it is more valuable, containing as it does a mass of practical up-to-date information, much of which is not set down in poultry-books.

Before investing in any books or appliances for the poultry business we would suggest sending for this book. It contains 136 pages devoted to the following subjects: How to get fertile eggs; how to get bigger hatches; how to rear heavy fowls; how to get broilers ready for the market in time to get top-notch prices; how to buy a good serviceable incubator, and a number of other practical points, all bearing on the question of dollars and cents. It is beautifully illustrated; and, although it contains so much, it is sent free to all our readers if they will simply say they are subscribers to this journal, or that they saw this statement therein.

SUCCESSFUL INCUBATORS.

One of the "old reliable" firms in the manufacture of incubators is the Des Moines Incubator Co., of Des Moines, Ia. They have been a long while in

the business—long enough to acquire a vast fund of information on the rearing and feeding of poultry raised by artificial means. In the course of their experience they must have taught thousands of successful poultry-keepers the principles of the art.

They have embodied the most of this information (boiled down, it is true) in their regular catalog, which is free to all who apply for it. Beyond this the company have a book which gives a great deal of valuable information relative to various phases of the poultry industry. The title of this book is, "The Proper Care and Feeding of Chicks, Ducks, Geese, and Turkeys." The price is 10 cts., prepaid.

It would be a mistake to think that this book is worth only ten cents. On the contrary, it is well worth fifty cents to any poultryman desirous of increasing his knowledge of poultry culture. We have alluded before to the great liberality of the incubator manufacturers in the matter of literature. They issue books which cost them thousands of dollars to print and publish. These are not mere advertisements, but are really excellent treatises on the subjects with which they deal, and the information is of the most reliable and accurate kind. Moreover, they are very practical.

The best we can do under the circumstances is to advise those of our readers who are interested in poultry culture to write direct to the Des Moines Incubator Co. and see whether these things are so.

Bees For Sale.

My bees have wintered perfectly—clean, dry, and free from dysentery—and I have decided to sell a few colonies. The bees are of the Superior stock, the hives nearly new, in good condition, and well painted. The combs are all-worker—mostly built on wired foundation. Everything is strictly first class.

For a colony in an eight-frame Langstroth hive the price is \$6.00; in a ten-frame Langstroth, or in a new Heddon hive (two sections) the price is \$7.00; and to each purchaser of one or more colonies the Review will be sent free for 1908.

I am now ready to accept and book orders accompanied by the cash; and when I have received as many

orders as I care to fill, no more will be accepted. The bees will be shipped by express, about the close of fruit-bloom, when the newly gathered honey will furnish the necessary water, and safe arrival will be guaranteed in every respect.

If you wish to stock your apiary with a strain of bees that has no superior, here is a chance to get a breeding-queen, such as the most of dealers ask from \$3.00 to \$5.00 for, already introduced, in a full colony, whereby she can be shipped without injury, early in the season, all at a moderate price.

W. Z. HUTCHINSON, Flint, Mich.

BEE KEEPING

will be a profitable industry this season.

Honey is high—short crop last year. The shortage of the honey crop for 1907 in the United States warrants bee-keepers to increase their colonies. About a half crop was produced, and in California, where the cheap honey comes from, only a quarter of the average crop was produced.

Get Ready Now for More Honey

Let us send you our catalog. We are manufacturers and sell only our own make of bee-supplies. Minneapolis is the largest lumber-distributing point; the Mississippi river furnishes us power, and our organization and labor conditions are the best for economical production. Send us an estimate of your requirements and let us give you prices. We have a large stock of standard bee-supplies on hand.

TO THE

BEE - KEEPERS OF CANADA.

WE are pleased to say that we are able to offer, in Canada, goods manufactured by The A. I. Root Co. While we do not offer every thing listed in their catalog, we have selected such articles as we believe will best meet the wants of the Canadian bee-keepers.

The heavy duty and freight charges we have to pay make it impossible for us to sell in Canada at Root's prices. We have, however, made prices as low as possible, and in no case do we charge nearly as much extra as the amount of freight and duty we ourselves have to pay on the goods.

We would ask you, when comparing our prices with those of other dealers, to take into consideration the QUALITY. If you do so we feel satisfied that you will place your order with us. The splendid quality of the material sent out by The A. I. Root Co. has given "Root's Goods" a world-wide reputation. Remember, "The best is cheapest."

CLEANEST,
CHEAPEST,
AND LARGEST
SMOKER SOLD
FOR A DOLLAR

The perforated side grate seen above holds a removable, metal, asbestos-backed fire shell, preventing burning the tin off the outer case, and deflects the air at right angles, preventing back draft to the valveless bellows. The air, passing to the back and over the top, cools and expels the smoke, fanning the burning fuel at top or side till all consumed, giving cool smoke for hours from one filling. It can't clog. No top-heavy cap to choke with soot; no valve to fail; no holes shedding sparks or hot ashes.

Four years' sales prove its success beyond a doubt, expensive dies making it uniformly perfect as possible to devise. We confidently guarantee full satisfaction or refund the price.

Price, \$1.00; 3 for \$2.50; by mail, add 25c. each

Send address of yourself and Bee friends for 8-page leaflet on "Smoker," and facts about Bees and Queens, 80 pages, free.

Queens Queens

of the

FINEST POSSIBLE BREEDING

BRED BY

F. J. WARDELL,
UHRICHSVILLE, OHIO, U. S. A.

After many years' experience as head queen-breeder for The A. I. Root Co., I am now breeding bees at the above address. My stock is equal to any now advertised, and my long experience enables me to judge very accurately the value of any strain. Mine is the celebrated red-clover stock, which has given so much satisfaction to thousands of buyers for a number of years past. If you desire something very select for breeding purposes, write to me, stating your wants, and the same will be supplied. I have no cheap or inferior queens to sell. My prices for the season are as follows:

	May to June.
Untested queen	\$1.25
Select untested queen	1.50
Tested queen	2.50
Select tested queen	3.50
Breeding queens	6.00
Select breeding queens	9.00
Extra select	1 year old, 12.00

No untested queens sent before May 15; but to secure your queens early in the season it is necessary to order now. Absolutely, all orders filled in rotation.

Queens FOR 1908.

Finest Goldenes bred in America. Send for my latest circular and prices — "and be convinced."
DANIEL WURTH, PITKIN, ARK.

How are Your Bees?

Any Queenless Colonies?

If so, send for a queen at once. We can furnish by return mail fine tested queens, reared last fall, wintered in four-frame nuclei, three-banded Italians, none better, \$1.00 each. Satisfaction guaranteed. Send for price list.

ITALIAN

Queens

and bees, and nothing but Italians. An improved superior strain is what QUIRIN-THE-QUEEN-BREEDER raises. Our stock is northern-bred and hardy. We just visited our outyards (all wintered on summer stands), and not a colony is dead to date (March 18). Some hives have lost scarcely a bee, so it appears. BROTHER BEE-KEEPER, how do you like such stock for hardiness? A party up in Maine got 50 nuclei of us several years ago. We just received a letter from him. He is after more of our bees, because last season he got 2200 pounds of honey which sold for 22 cts. per pound. Our stock is well known throughout the United States. Some of the largest yields reported can be traced to our stock. Over 20 years a breeder. Free circular and testimonials. Price of stock as below.

Prices of Queens before July.	1	6	12
Select queens	\$1 00	\$5 00	\$ 9 00
Tested queens	1 50	8 00	15 00
Select tested queens	2 00	10 00	18 00
Breeders	4 00		
Golden five-band breeders	6 00		
Two-comb nuclei, no queen	2 50	14 00	25 00
Three-comb nuclei, no queen	3 50	20 00	35 00
Full colonies on eight frames	6 00	30 00	

ADD the price of whatever grade of queen is wanted, with nuclei or colonies; nuclei ready about May 1st to 10th; can furnish bees on Danzenbaker or L. frames; pure mating and safe arrival guaranteed. We employ 400 to 500 swarms in queen-rearing, and expect to keep 500 to 1000 queens on hand ready to mail. Our Northern-bred bees are hardy, yet gentle; they will give you results. Address all orders to

QUIRIN-THE-QUEEN-BREEDER, Bellevue, Ohio

NEW ENGLAND BEE-KEEPERS

WE
ARE
HEADQUARTERS FOR

Bee - supplies

in this section, as we carry the largest and most complete line of Hives, Supers, Sections, Foundation, Bee-smokers, and other Apiarian Supplies, of any one in the New England States. We have a good stock of goods on hand now, and solicit your orders. Send postal for price list of

Bees and Queens.

W. W. CARY & SON
LYONSVILLE, MASS.

GOLDEN-ALL-OVER and RED-CLOVER ITALIAN QUEENS

My stock is the result of years of careful selection, and is equal to any in the country. The prices are only such as to insure long-lived, prolific queens, whose workers will be hardy and good honey-gatherers. Write for 1908 circular. PRICES.

	1	6	12
Untested	\$1 00	\$5 00	\$9 00
Select untested	1 25	6 50	12 00
Tested, \$1.75 each; select tested, \$2.00 each.			

By return mail after May 25, or money refunded.

Wm A. Shuff, 4426 Osage Ave., Philadelphia, Pa.

Taylor's Strain of Italians is the Best

Long tongues and goldens are the best of honey-gatherers; 19 years a specialty, breeding for the best honey-gatherers. Untested, 75 cts. each, or \$3.00 a dozen; tested, \$1.00 each, or \$10.00 a dozen; select tested, \$1.50 each. Breeders, the very best, from \$3.00 to \$5.00 each. We sell nuclei in full colonies. Bees in separate yards. Safe arrival guaranteed. Send all orders to

J. W. TAYLOR & SON, Beeville, Bee Co., Texas.

Italian Bees and Queens

from Root's red-clover stock of golden Italian queens. Untested, 75 cts. each, six, \$3.75. Select untested, \$1.00 each; six, \$5.00. Tested, \$1.50 each; six, \$8.00. Select tested, \$2.00. Two frame nuclei, with untested queen, \$2.25. Orders filled in rotation. Send all orders to E. A. SIMMONS, GREENVILLE ALA

NOT CHEAP QUEENS. BUT QUEENS CHEAP

500 Best Strain Italian Queens Ready to Mail March 1st. Untested queens in lots as follows: 1, 75 cts.; 6, \$4.20; 12, \$ 7.80. Tested queens in lots as follows: 1, \$1.00; 6, \$5.70; 12, \$10.80. Breeders' queens in lots as follows: 1, \$5.00; 3, \$12.00. Nuclei with untd queen: 1-fr, \$1.75; 2-fr, \$2.25; full colonies, \$4.75. Nuclei with tested queen: 1-fr, \$2; 2-fr, \$2.50; full colonies, \$5. Also dealer in bee-keepers' supplies, Root's goods. Ask for cat'g. W. J. LITTLEFIELD, LITTLE ROCK, ARK.

The Story of Joe, of Idaho.

By the Bee Crank.

When Joe and Ida settled down
In Idaho forlorn,
Joe won renown—he beat the town
At pool from night to morn,
And, sad to say, he slept by day
While Idahoed the corn.

One day she read a Pouder ad.,
And then she found her tongue;
Said she to Joe, "Now you can go;
No longer will your Idaho; [ey,"
I need the money, it's me for hon-
And Joe—well, Joe was stung.

The fact of the matter is, Ida was a better business man than Joe. She sent here for an equipment of Danzenbaker hives, foundation, sections, a veil, and a lot of other material of Root quality. With this cue from Ida,

Joe has improved his habits and is doing much better.

My catalog tells all about these goods, and it is free. If more convenient, make up your order from Root's catalog, as prices are exactly the same, and I ship these goods from Indianapolis at factory

prices. I shall consider it a favor if you will send your beeswax here, as I pay highest market price, cash or in exchange for supplies.

Walter S. Pouder,

No. 7

E. D. TOWNSEND finds that greatly contracted entrances at first spring flight hinder bees drifting and massing at a few colonies, p. 346. Same here.

TO LENGTHEN the blooming period of any honey-plant, get plants from further north or south. For example, get lindens from the north for earlier bloom, and from the south for later bloom.—*Deutsche Bzcht.*, 32.

"BOTTOM-BARS with only $\frac{1}{4}$ -inch space between them would retard communication between stories very much," p. 343. And yet with such spaces my queens seem to pass readily up and down when keeping brood in two stories.

THE ADVANTAGE of wide bottom-bars is asked for, page 346. They are a distinct aid in keeping bees from building combs between two stories. But there has always been some question in my mind whether this advantage were not offset by disadvantages. Most assuredly I would not have them if I wanted to look up between bottom-bars.

"QUEENS never react either peacefully or hostilely toward strangers or toward bees belonging to the hive," page 232. I am sure there are exceptions to this rule. I once saw a queen grasp a worker, and almost immediately it was a dead worker. Others have reported that one difficulty in introducing queens was because of their hostile attitude toward the workers.

I DON'T KNOW how bees know so much, but I think it is the general understanding that they are far-sighted enough to be more lavish in starting brood in the spring with a big lot of honey in sight than with only enough to run from day to day. So give me a hive heavy with honey in the fall so not the

slightest thought need be given as to feeding again before the next harvest.

A \$6.00 BREEDING-QUEEN was bought by A from B, and died several months after safe arrival, and introduction. A wants B to replace; B refuses, but is willing as a compromise to send another good queen. A seems to think B ought to do better, p. 339. I suspect a whole lot of queen-breeders will throw up their hands in amazement at that sort of ruling. I'd like to know why B is held responsible to do any thing in the case, and how old that queen must be before his responsibility ends.

JAMES C. WHITE is wisely advised, p. 369, to tier up to prevent swarming. Let me add an item: Shove the second story either back or forward so as to make a $\frac{1}{4}$ -inch crack for ventilation. Do this with each added story. This will double the security against swarming. [You are probably right, that this extra ventilation will aid materially in the prevention of swarming. But is not so much ventilation an indirect loss in that it requires a large portion of fielders to stay at home to keep up the necessary body heat—that is, comb-building temperature? Understand, we do not claim that you are wrong on this point; but, to use a familiar phrase of yours, "I don't know." Who does?—ED.]

G. M. DOOLITTLE, p. 341, will not admit that a difference in comb-building makes a difference in the number of bees going to the field. Possibly he is right, but there is a fine chance for argument on the other side. Under average conditions a bee will not go afield under sixteen days; but when there are no older bees for the work, a bee five days old will become a fielder. Now take two strong colonies alike in all respects except that one of them has all its surplus combs to build, and the other none. Don't you believe that the exigencies of the case, seeing that a bee *can* go afield when not half of sixteen days old, will send more bees afield from the one colony than the other?

JOHN HENDRICKS quotes from a religious work: "The propagation of their species, by butterfly, bee, and moth, without the custom-

ary presence of male companion, is a discovery corroborative of the science of mind; because these discoveries show that the origin and continuance of certain insects rest on a foundation apart from sexual conditions." And he asks whether this is true of any bee and of other insects. No, it is not true of any bee or other insect. Yes, it is true of our honey-bee and of other insects. It is most emphatically not true in the sense in which it will be understood by the ordinary reader, who will understand it to mean that one could continue his bees from year to year if he never allowed a drone to appear. It is true in the sense that *some* bees may be brought into life without the intervention of drones; but bees so produced will all be drones. No queen or worker can proceed from an egg unless that egg is fertilized.

LOUIS SCHOLL says, p. 348, "contrary to the arguments of some of our authorities, I believe that hives well painted will last very much longer, keep in shape better, and look nicer than unpainted ones." Who are the authorities, Louis? I didn't suppose any one believed differently. [The authorities referred to must be yourself and Mr. Doolittle. While it is very true that you are in harmony with the proposition stated by Mr. Scholl, yet you have, if we remember correctly, made the statement that it did not pay you to paint your hives. While this statement, strictly speaking, is not in conflict with the one made above, yet it impliedly is. If we remember correctly your real contention is this: That it does not pay you to paint your hives; for by the time that they will be of no further service for lack of paint you probably will want something of a different pattern, involving a different system. In your forty years of bee-keeping you have changed your hives once already. In the period mentioned you would have gained nothing in dollars and cents to paint the hives. This is as we understand your position. Are we right?—Ed.]

"Requeening is something that I have believed could be most profitably left to the bees; but I think those on the other side of the question have the best of the argument when it comes to the improvement of stock by selection. If we allow each colony simply to requeen itself when the queen becomes old, there is not much likelihood of the young queen being any better than her mother."—*Review*, 84. It is a mistake, Bro. Hutchinson, to assume that those who advocate letting queens do their own superseding allow *each* colony simply to requeen itself. I think no one has more earnestly advocated improvement of stock than I, at the same time allowing queens to do their own superseding; but not *each* queen. Any queen not coming up to the mark is replaced by a better one. Please tell me why that doesn't give just the same chance for improvements as the plan given by S. D. Chapman. *Review*, 73. Mr. Chapman removes old queens a week before the close of the raspberry flow, letting each colony requeen itself, except

the inferior ones, to which he gives choice cells. I do much the same thing, only I don't cut them off at a year old. Let me say in passing that Mr. Chapman's plan for annual requeening is good, excellent, and I'm not so cock-sure that it may not be better, at least for many, than allowing queens to live longer.

I DON'T WANT to say a word belittling the excellence of O. L. Hershiser's plan of management in the spring, p. 348, but I do think he greatly underestimates the capacity of certain colonies in one of his assumptions. He assumes that a colony with from three to four Langstroth combs fairly well filled with brood five or six weeks before the commencement of the main honey-flow (white clover), with a good honey season and a good location, but no fall flow, "will gather enough honey on the average for winter stores, but no surplus." If such a colony did no better for me, with no attention except putting on and taking off sections, I would count that there was a queen whose head needed to come off, and would feel greatly dissatisfied with less than 50 lbs. surplus, and would be rather expecting 100. On the other hand, the editor greatly overestimates, p. 347, when he talks about "getting all the queens to laying to their full capacity from the time manipulations are begun in early spring." With one-fourth of the colonies "weak, with from two to three L. frames containing brood," will the queen in those weak colonies lay more than one-fourth of their full capacity? [We will let Mr. Hershiser answer for himself. As to our statement, it would appear to us that, under the conditions of the very weak and the very strong colonies, each set of queens could with proper coöperation on the part of the apiarist, lay to the extent of their full capacity; but the queen of the weak colony will have a smaller cluster and fewer frames at her disposal. But as these are easily taken out after being filled with young brood we do not see why she would not be able to lay in a smaller room as many eggs as a queen having a strong force of bees. Strictly speaking, no queen ever lays to her full capacity. If she is a good one she will often get ahead of her bees. It is then that the apiarist will intervene in her behalf.—Ed.]

MAJESTIC Lake Tahoe, amid the snow-capped Sierras, is soon to be taken in charge by Uncle Sam's engineers who are in the Reclamation Service. The level of the lake is to be raised by building a dam across its outlet, which is the head of the Truckee River. The idea is to control the water so as to irrigate a large extent of land which is now a complete desert. Nowhere has bee-keeping been more successful than in Nevada where irrigation is practiced. Neither in quality nor in quantity has the honey been excelled. It is, therefore, a pleasure to see that the national government proposes to increase greatly the area of available bee territory.

W. K. M.

We have found it necessary to continue our special series of spring articles in this number. At the same time, we enlarge it enough to take in another installment of the series by Dr. von Buttel-Reepen. This should be read with unusual care, as it is both interesting and valuable.

THOSE whose subscriptions expire or have expired will please read the editorial on page 277, Mar. 1st. Except under certain conditions we shall not be able to continue the journal longer than the time paid for. If you can not send a remittance at once, but desire the journal to be continued, please let us know, stating when you will be able to pay up.

A FAVORABLE SPRING THUS FAR.

SPRING thus far is favorable, in that the month of March has not been warm, but chilly most of the time. If we do not get warm weather before the middle of April in our locality, we expect nice weather thereafter, and a good year for bees. If it is a warm March, followed by a cold April, it works havoc with bees that are well started in brood-rearing.

MORE GLUCOSE.

LATE press despatches say that the immense glucose-factory at Marshalltown, Ia., has been purchased by the Western Grocery Co. The latter is credited as being worth \$5,000,000, and operates branch houses in several western cities. The plant at Marshalltown is on a gigantic scale, and ought to turn out an enormous amount of glucose in the course of a year. The Iowa beekeepers may certainly expect to see lots of "near honey" sold in their vicinity this year.

W. K. M.

SPRING FEEDING AND THE COLOR OF PAPER WINTER CASES.

THE accumulating testimony seems to show that spring feeding, to stimulate, is a practice that should be discouraged. The best time to feed is in the fall, at which time the colonies should be fed liberally and in big feeds.

There seems to be a difference of opinion as to whether winter cases should be covered with *dark* or *light* colored papers. In view of the fact that black absorbs heat when the sun shines brightly, warming up the colony, we have used a light-colored paper—one that would be less subject to the effect of the rays of the sun. The time was when poultrymen advised the use of glass in poultry-houses; but the effect of this was to make

the building unnecessarily warm on bright days. The extremes of temperature from a sunny to a dark day did more harm than good. The same principle will apply in the case of a dark or light paper for winter cases.

Some years ago we conducted some elaborate experiments, painting some of our winter cases black and some red. But we found the dark colors would drive the bees out on a bright day, yet too cool for them to stay out without getting chilled. We have for years advised painting chaff hives white.

ARE WE SACRIFICING DESIRABLE TRAITS FOR AN UNIMPORTANT CHARACTERISTIC IN OUR BEE-BREEDING?

WE desire to call attention to the excellent point made by C. F. Bender, in this issue, where he says the constant temptation of a queen-breeder is to breed for beauty alone. This quality, even if desirable, should be placed, he thinks, at the bottom of the list of good breeding points; "for," he says, "the more qualities we breed for, the *less we get of each particular quality*." This is only another way of saying that stock with extraordinarily bright-yellow color must have sacrificed correspondingly in the development of one or more other good points. A race horse, for example, is good for nothing but speed. Other desirable qualities have been sacrificed for the one thing—*speed*.

There is this to be said, that *color* in bees is the only quality that can be made to stand out prominently, unless it be temper; and it is the only one that shows at once that the queen-breeder has accomplished some particular end.

SUGAR AND HONEY AS PRODUCERS OF MUSCULAR ENERGY.

THERE is a well-nigh universal opinion that such foods as sugar and honey are almost valueless as producers of muscular energy. But read what the highest medical authority in the world, the *London Lancet*, has to say on the subject:

Sugar is one of the most powerful foods which we possess, as it is the cheapest, or, at any rate, one of the cheapest. In muscular labor no food appears to be able to give the same powers of endurance as sugar; and comparative practical experiments have shown without the least doubt that the hard physical worker, the athlete, or the soldier on the march, is much more equal to the physical strain placed upon him when he has had included in his diet a liberal allowance of sugar than when sugar is denied him.

Trophies, prizes, and cups have undoubtedly been won on a diet in which sugar was intentionally a notable constituent. It has even been said that sugar may decide a battle, and that jam after all is something more than a mere sweetmeat to the soldier. The fact that sugar is a powerful "muscle food" probably accounts for the disfavor into which it falls, for a comparatively small quantity amounts to an excess, and excess is always inimical to the easy working of the digestive processes.

Sugar satiates: it is a concentrated food. Where sugar does harm, therefore, it is invariably due to excess. Taken in small quantities, and distributed over the daily food intakes, sugar contributes most usefully in health to the supply of energy required by the body. And it is a curious fact that the man who practically abstains from sugar, or reduces his diet to one almost free from carbohydrates in favor of protein foods such as meat, often shows feeble muscular energy and an indifferent capacity for physical endurance.

Honey comes under the same category as sugar, with this difference: It is almost ready to pass into the blood without further change; and it is far more palatable than sugar, since it possesses an almost priceless aroma which stimulates the appetite and promotes digestion. If a person has the means he should, as far as possible, use honey where others use sugar.

Some say honey is not a necessity; but such people are using sugar, probably to excess. Sweets are an absolute necessity to the civilized man. No race can long exist without sugar in some form, and civilized men are the greatest consumers of it.

The Secretary of Agriculture over in Ontario recently stated that one pound of honey is equal in dietetic value to five pounds of pork; and such a statement is well within the mark. Modern science abundantly confirms it. W. K. M.

LIQUEFYING CANDIED HONEY AT A COMPARATIVELY LOW TEMPERATURE IN A LARGE INCUBATOR.

As reported on p. 278 of our March 1st issue, we have been conducting some experiments, and expected to give the conclusion of them in our last issue; but, unfortunately, the incubator "went bad," the temperature going up so high as to melt the wax of the comb, and consequently we had to start all over again. We have a very large incubator, and in it we placed sections of comb honey candied almost solid. The honey of some of these within ten days was completely liquefied without any apparent damage to the comb; others, at the end of two weeks, were not brought entirely to a liquid state; but the top of the comb shows in some cases some slight stretching, while the bottom shows a corresponding compression or sagging. The temperature has not gone higher than 105° nor lower than 103°. The incubator in question is one of the standard makes, large enough to use two lamps at a time.

We are not entirely satisfied with the results thus far, for we believe that, with a slightly lower temperature, say 103°, extended over a longer period, there would be no stretching of the combs; and the honey, practically all clover, could be entirely reliquefied. We have demonstrated this much—that comb honey *partly* candied, that is, the honey—can, at a temperature of 105°, be liquefied in four or five days; in other words, we can arrest the process if we see it starting, and bring the honey back to its normal state, and that, too, without injuring the combs.

Candied comb honey so treated is delicious. The honey is thick and waxy, and as clear as it was the day it was gathered by the bees. The flavor is in no way impaired, and the comb surface seems to be as perfect as when the bees left it.

Of course, an incubator in a commercial way would be impracticable; but we are of the opinion that a honey-room large enough

to hold several thousand pounds could be equipped with steam or hot-water radiators so that the temperature could be maintained at about 104° for a period of ten days or two weeks. If the progress is watched carefully, and the temperature checked when it begins to get too high, hundreds of dollars may be saved in lost comb honey that would not have brought otherwise more than the rendered wax and an inferior quality of honey secured through the process of rendering.

We will conduct our experiments further; and if they prove satisfactory we think it will be possible for a dealer or large buyer to make good money by buying up candied comb honey and bringing it back to its normal state in a specially heated room. There is money in this proposition—lots of it; and we suggest that others having incubators—and we must have thousands of subscribers who are supplied with them—try this experiment in a small way and report results.

SHOULD THE SALE OF SPLIT SECTIONS BE DISCOURAGED? ARE THEY LOSING THEIR POPULARITY IN ENGLAND AND IRELAND?

A SHORT time ago there appeared in these columns a discussion of the relative merits of split sections (that is, sections split through the top and both sides) and the ordinary sections in which the foundation is fastened in any of the standard ways. We took the ground that the first mentioned, owing to the foundation protruding through the sides and tops, would, when they fell into the hands of consumers, give rise to the old comb-honey canard which we have been fighting for years and years. For that reason we questioned very much the wisdom of pushing their sale. Mr. Hand, on the other hand, took issue with us, saying that he had sold thousands of such sections, but never once had it been said that his comb honey was manufactured.

Along about this time, Dr. Miller, in one of his Straws, stated that the popularity of split sections in England was waning. We remarked that, from the evidence in our office, it was getting to be increasingly apparent that the demand for them in England was decreasing. Referring to this the editor of the *Irish Bee Journal*, in his issue for March, has this to say:

It is quite new to us to hear that British consumers object to the split section, and we are bound to say that the assertion is altogether contrary to our experience in marketing comb honey in England. Nevertheless, a statement of the kind, coming from two such eminent men, seemed to us to demand investigation; for, if it were justified by the facts, honey-producers who supply the English market would need to revise their method of preparing sections. Accordingly we placed ourselves in communication with a large number of the leading British and Irish producers, all of whom assure us that their experience agrees with our own. They have never heard of any objection to split sections on the part of buyers in England, nor of any depreciation of the value of comb honey marketed in such sections.

We believe it to be only fair to Mr. Hand and the advocates of split sections that the

statements be given their full weight. But the comb-honey canard never had the continuous circulation over in England that it has had here. In this country it has been the one thing that has kept down the price of comb honey, because the public were suspicious of *all* honey in the comb and would not buy. Now that this hoary canard has all but died a natural death it would seem as if we might be taking long chances to put out a style of section that would give even the faintest suggestion of the so-called "manufactured comb honey." It is our honest conviction that it would be very wise to go slow, especially as it now appears that we can put in full sheets of foundation cut to fit in regular sections.

SPLIT SECTIONS OLD.

We find by our orders in the manufacturing department that the sale of split sections in England is beginning to ease up. Whether other manufacturers are having an increased trade we are not able to say. We also find that the sale of split sections, as compared with all other kinds, is only about 25 per cent of the total number sold in Great Britain. The great majority, apparently, in the mother country at least, favor solid sections and using one or more of the different methods of fastening foundation to the wood. When it is remembered that the split section was first illustrated and described by Mr. Samuel Simmins, in his book "A Modern Bee Farm," in 1887, and then further described in subsequent editions of his book, 1893 and 1904, it would appear by this time that they should have had a larger proportionate sale.

Later.—Just as we go to press, it is, perhaps, proper for us to say that we have been looking over several supers of split sections, in which foundation was put in on the J. E. Hand method some months ago. We were surprised to note that the foundation had buckled in many of the sections. Then we looked over some regular sections, in which foundation had been fastened on all four sides. These were buckled also. In both cases extra-thin foundation was used. Possibly the buckling would not have occurred if we had used the grade called "thin super."

If the Yoder plan of fastening to the top, and part way down the sides, with a gap of $\frac{1}{4}$ inch at the bottom, will prevent this buckling, the problem is solved.

BEE-KEEPERS FURNISHING ALSIKE-CLOVER SEED TO LOCAL FARMERS.

A YEAR ago we furnished alsike-clover seed free of charge to all farmers within a half or three-fourths of a mile of any of our bee-yards. We did this to get it more generally introduced in our vicinity; but we did not then anticipate that so many of them would jump at the chance as they did. Having made a general offer we stood by it, even though it took over \$150 worth of seed to supply the call for it. Well, the result is that alsike-clover seed has been pretty gen-

erally scattered all over the territory within a mile of our bee-yards.

This year we expect there will be just about as much alsike distributed, in spite of the fact that we do not furnish it free, but charge half price.

During the last few years farmers have been learning the value of alsike as a forage-plant, and many of them are sowing it with their timothy to increase the food value of the hay. In a trip about a year ago through the heart of Michigan we noticed that the farmers there were sowing alsike with timothy; for every field of timothy that we could see had alsike growing with it.

In favor of alsike it may be said that it takes *only half the amount of seed to cover a given area* that red clover does; it has a *higher feeding value*, and, what is more, it will *stay in the ground for three or four years*, while red clover will run out in a single year.

It has been observed by bee-keepers that white clover, owing to intensive farming, has been gradually running out; but to offset this, alsike is taking its place; and when farmers come to know its real value, and that it costs only half as much to sow an acre of it, it will be grown more largely than at present.

Every bee-keeper in this country, where alsike will grow, should make arrangement to furnish seed, either at half price or at cost. He should take pains to go among his farmer friends and explain its advantages, and urge them to grow it. If he continues this policy a few years he will have a locality that will be one of the best for honey. This is not mere theory, for we have plenty of facts to prove it.

The efforts that have been thus far made to increase the length of the tongues of our bees have not accomplished a great deal as yet. One reason for this is the difficulty of controlling the male parentage, with a view of accentuating increase of tongue-length. But if we can substitute alsike for red clover we can solve the whole proposition.

Alsike-clover hay mixed is beginning to have a special market value. For race horses it is considered the best hay obtainable. If it is good for this class of animals it ought to be good for others. Dairymen who have tested it have learned that it increases materially the quality and quantity of milk.

Bee-keepers everywhere should now get busy to see that a supply of seed is obtained, and furnish it at cost or half price. We furnish it free of cost in case it is to be sown where a field abuts our apiaries, or at least comes within a hundred yards or so of them. But where seed is given away it should be *plainly stipulated* that it be *sown in the regular way*, on cultivated ground, and not thrown broadcast on the top of the ground of regular meadow land. While much of the seed will spring up, much of it will be lost. Where one pays half price for his seed we may rest assured he will not waste any in that way.

BROOD TOUCHING THE FRAME-BARS.

"I want to talk a little about brood-chambers this morning, Mr. Doolittle. Up to last year I always used a brood-chamber holding frames 12 inches deep, and I seemed to have trouble in getting the bees to work in the sections."

"What did you think was the trouble, Mr. Jones?"

"The bees seemed to store so much honey at the top of the brood-combs, above the brood, that it seemed to make the distance too great between the brood-nest proper and the sections above, and on account of this they did not enter the sections readily."

"And you think that was the trouble?"

"Think! I almost know it was. A year ago last winter I made all my new hives so that the frames were only ten inches deep, inside measure; and when colonies had been in them a month or so it was no uncommon thing to have these combs with the brood touching the top-bars to the frames all along the edges of the comb."

"Were the results in section honey any better?"

"Nearly double the amount of section honey was secured from such hives. The old ones did about as well as ever, but hives where the brood came up all along the tops to the frames just piled the honey in the sections."

"Then I suppose you would call this last hive of yours a good one."

"Yes, I do; and I came over to ask you if you think I would be making a mistake in making my old hives over like these."

"I do not think you would, for having the brood extend to the top-bars of the frames in the hive is one of the great secrets in *comb-honey* production; and I claim that the main reason for your new hive being a good one is because you can thus secure the brood in the frames. Few seem to realize that, unless the hive is so filled with brood at the commencement of the honey harvest that it comes out to the frame-bars in the most of the combs, there is no assurance of a *good* crop of honey, no matter how profusely the flowers bloom, nor how abundant the secretion of nectar in those flowers."

"But do you think that the brood touching the top-bars to the frames has all to do with it?"

"No, not altogether. I always thought that this brood coming up to the top-bars caused the bees to enter the sections as soon as any nectar was coming in from the fields, on the principle that it is nature's way for the bees to store their honey above the brood.

But this does not entirely control their going into the sections. There is something else which has a great bearing on this part of the matter."

"What is that?"

"Unoccupied comb. Plenty of unoccupied comb in the brood-chamber, at the commencement of the honey harvest, means that there is not apt to be plenty of honey in the sections. Bees will always store honey in any comb which is completed (and not occupied in some other way) before they will go to building comb, or even drawing out foundation in the sections; and as long as there is such unoccupied comb in the brood-chamber they will commence to store honey there, no matter how much we may wish it otherwise; and having once started storing in the brood-chamber they are always more or less reluctant about going into the sections."

"I supposed the trouble was that the bees had to pass over the honey in going into the sections."

"That had some effect, without doubt; but that was not the whole trouble. To give the best results the combs remaining in the brood-chamber at the commencement of the honey-harvest should be literally filled with brood, which term I use broadly; for where brood is in abundance, there must also be some pollen and honey to supply the wants of that brood; and where no more is on hand than is needed for the wants of the brood from day to day, such honey and pollen are virtually the brood. But, above this, there should be room for nothing at the commencement of the harvest. Empty cells of comb, even to the amount of storing five pounds of honey, will tell to the disadvantage of the section honey. With the hive or brood-chamber literally full of brood, as explained above, at the commencement of the harvest, the bees *must* put their first loads of nectar in the 'baits,' which should be in the first super of sections put on such hives; and with the storing of this first nectar in these baits, work is at once begun in the sections surrounding these, the comb foundation being drawn out where the sections are filled, or work on the starters progressing finely where only starters are used; and having once thus begun in the supers, the work is continued to the end of the harvest."

"Well, there is more to that part than I had imagined, even in my enthusiasm."

"Before we leave this matter let us consider unoccupied combs in the brood-chamber, and see what happens. With the unoccupied comb the bees will commence storing their first loads of nectar in the unoccupied cells; and when these are nearly full the cells will be drawn out or lengthened all through the hive, which unfits them for the rearing of brood; and as young bees emerge next to these drawn-out nectar-filled cells the brood-cells will be drawn out, thus crowding out the queen more and more, till at the end of the season we have little honey in the sections with few bees in the hive for winter. Now this makes all the difference imaginable be-

tween success and a mere pittance from our bees when it comes to section honey. With extracted honey the supers are generally filled with comb, so the first nectar goes into the supers, and the queen can spread herself all she wishes, often doing this to the complete exclusion of honey from the brood-chamber, without any effort on the bee-keeper's part."

"But what effort can the bee-keeper make when working for comb honey?"

"Just what you have been doing with your new hives. Cut down the frames, which reduces the size of the brood-chamber, till the queen and bees, of their own accord, have the hives literally filled with brood when the harvest commences. Or do what I prefer—use a ten-frame Langstroth hive, and in their connection use one, two, three, or four division-boards, just in accord with the prolificness of the queen. At the commencement of the honey harvest I take away all the combs in the hives which are not occupied with brood, and insert in their places a division-board which is simply a piece of an inch board of the size of a frame, with a top-bar to a frame nailed to it, and thus bring the brood in the hive to where I wish it, whether the queen is very prolific or otherwise."

"Do you treat all of your colonies that way?"

"No. Half or more of the queens are so prolific that there is no need of any division-board; many more require only one board, while a very few require more than two. With the two this practically makes an eight-frame L. hive, which hundreds of our best bee-keepers recommend. But I would far rather have a colony go into the honey harvest with only five combs filled with brood and five division-boards than to have the same colony with five frames with brood and five frames with nearly all empty combs."

THE SWARMING PROBLEM.

I have been requested to make clearer my method of doubling up swarms as described in the Oct. 15th issue of GLEANINGS. In reading over this article I must confess that, in endeavoring to be brief, I expected the reader to take too much for granted. The point in question was concerning the clustering of the swarm, "That it should be allowed to cluster near the old stand," etc. While the swarm is in the air I catch the clipped queen, which is usually found near the hive

energetically climbing all the weeds and grass in the neighborhood. I then put her into a Miller queen-cage. If there is a branch of a tree near the old stand I tie the cage to that. Then I remove the old colony; and the swarm, as it returns, will cluster around the cage. The bees belonging to the old hive will, as they return from the fields, cluster with the swarm as if they had originally intended to be a part of the game.

I have tried several modifications of this plan. If no tree stands near by I place an empty hive on the old stand and place the cage containing the queen in this hive. The bees will soon return, and at once go into the hive. Then at night I dump the bees in front of a hive that is not doing very good work in the supers. If I have a young queen in a nucleus (I usually have such during the swarming season) I requeen the old colony at once. If there is no young queen on hand I give the old queen back to the old colony till a young one can be raised.

If my future experience with this method works as well as it has during the past three years I shall look for nothing better in the way of handling new swarms. It is scarcely any work. You have no increase. The old colony will usually gather plenty of honey to winter on.

The united swarms will make extra fancy honey on account of there being so many in the hive; and where a strong swarm is put with one not doing good super work, *more honey will be obtained than if there had been no swarm*, because the entire new swarm is put to work in the supers.

Another plan I have tried in a limited way gave the best of satisfaction in handling swarms when it was necessary for me to be away from the yard. In other words the conditions were the same as they would be in an outyard. I look through the bees, searching for cells by raising up the hive and looking at the bottom of the frames. When I found one that was preparing to swarm I simply moved it to a new location and gave the super it held to the hive on the stand from which the old one was removed. I keep two hives on the same stand. The returning bees will go into the other hive and work with the strange bees as well as they did before. The result has been in every case that the hive that wanted to swarm gave up the idea at once and immediately tore down all cells. This has not given quite as good results in comb honey as the first method named, as you can not give this force of bees to any weak colony you might wish to. Then, again, I find that, as a rule, more bees will go out with a swarm than will naturally return to their old location when their hive is moved.

The plan I am going to try next season will be to make a small tripod out of light stuff and lay a light pole across it. The cage containing the queen will be hung upon the end of this pole, and the bees allowed to cluster there. Then in the evening I will take the bees on the end of the pole and dump them as previously described.

SPRING DWINDLING.

Three Principal Causes, and the Remedies; Tin Markers to Show the Age and Value of the Queens.

BY E. W. ALEXANDER.

During the first month after taking bees from their winter quarters there are usually more colonies lost than during the other eleven months of the year; and it seems really harder to bear the loss then than at any other time, for we know that, if we can keep them alive and in their hives during those chilly, cloudy, changeable days of early spring, we can soon have them good colonies for the coming summer. While there are several conditions that help to bring about these disastrous results, there are three that stand out as the principal causes of spring dwindling.

The first cause is an old queen—one that stopped laying early the previous fall. Colonies with such queens become weak in bees during the latter part of winter, and, not being able to keep their hives warm enough, they are soon affected with dysentery, and, after they are set out, they waste away until none are left. This cause of spring dwindling can be easily prevented by introducing young queens early in the summer, so they will have a fine lot of brood at the close of the season.

Another serious cause is poor honey for winter stores. This is a more frequent cause, and far more disastrous than the loss from old queens, for the losses from poor winter stores affect all colonies alike, and the poor bees die by the thousands while in the cellar, and still faster when first set out, until nearly every colony is dead.

One winter I lost 417 colonies from this cause out of 432; but we can now prevent all loss from this source by giving our bees sugar syrup to winter on in the place of unsuitable honey.

Another very serious cause of spring dwindling is the desire of the bees to fly on those changeable days I spoke of above. This loss can also be almost wholly prevented by placing the hives, when taken from the cellar, so the entrance will *face the north*; then in addition to this have a shade-board so it can be easily placed where it will shade the entrance still more, and somewhat darken it. To prevent still further their desire to fly on cloudy days, give the colonies about a pint of warm sweetened water every night about dark. This will encourage them to breed fast, and at the same time prevent thousands from becoming lost on chilly days in search

of water. If you prefer to have the hives face some other direction it is but a short job to turn them around to any point after the changeable weather of early spring has gone by. Please try this method, and you will find that the bees will have but little desire to fly except when the temperature is warm enough to fly safely in the shade; consequently the old bees are saved until the colony has a fine lot of maturing brood.

As experience enables us to cast aside the fatal results of spring dwindling, it seems as if we had taken another step forward along the line of progress. The cares and anxiety of another busy season will soon be here, and our plans should be well matured for the coming summer. Have you secured your necessary help and your supplies? Do you know how much increase you will make and how you will make it? Have you decided whether you will rear your queens or buy them? If you intend to purchase, have you sent in your order? If not, attend to this at once. I find that some of our best queen-breeders have now (Feb. 25) all the queens engaged that they can rear the coming season. These are important matters to look after, and should be attended to very soon.

HOW TO KEEP THE RECORD OF THE QUEENS.

I am frequently asked through the mails what system we have adopted to keep a correct record of the age and quality of our queens. I think I have answered this question before in some of my former articles; but it is so easy and practicable it will bear repeating for the benefit of those who have not seen it. We cut out a few hundred pieces of tin, about $1\frac{1}{4}$ inches in diameter. Some we made round, some half round, and some square; then with a small wire nail or a bradawl we make a hole in the center of each piece. Every summer we use a different-shaped piece of tin to mark all the hives that have queens of that summer's rearing. Two years ago we used the square pieces; last year we used the round pieces; this summer we will use the half-round. We tack one on the front right-hand corner of each hive, with a carpet-tack. They are easy to remove; and whatever hive a queen occupies during her life, that tin tag goes with her. In marking our common ordinary queens the tag is placed on the corner of the hive about two inches above the bottom-board. If the queen is better than ordinary, the tag is raised up the corner according to her real worth. If she is a little off in any way we put the tin toward the other side of the hive, according to how poor she is. In this way it takes only a moment to mark the hive so that, at a glance, we can tell at any time we see the front of a hive the age and quality of the queen it contains.

We have practiced this method for about forty years, and during this time we have tried some others, but have never been able to find another so easy and practicable as this.

If you will try it I am sure you will never again neglect this very important part of the business.

You may talk and write about the importance of a good location, also of the knowledge and experience of the man in charge, each being very essential; but *to have a good queen of a good honey-gathering strain in every colony is of more importance than any other one thing connected with the business*; for if the colonies have poor old queens that can not be induced to keep their hives half full of brood we might as well give up at once, for we shall get little or no surplus, and our hopes will be blasted. We should continually try to profit by our past experience, not only in caring for our bees, but in disposing of our honey. Don't be satisfied with the results of the past, but strive to make the coming season the most profitable one you have ever had.

Delanson, N. Y.

[We notice that our correspondent recommends facing the hives in the spring toward the north, with a storm-door or lean-to board placed in front of the entrance to shut out prevailing drafts. There may be something in this, because we have observed in the last few days that, wherever the sun strikes the entrances, storm-door or no storm-door, the bees will fly out of the hives with such entrances before they will come out of hives having the entrances face toward the north. But over against this we have often observed in the case of our outdoor-wintered bees that colonies with entrances toward the north very often die, and we have attributed this to the north exposure. This is a question that will bear some discussion, and we should be glad to hear from our readers.—ED.]

STRONG VERSUS MEDIUM COLONIES AT THE OPENING OF THE HAR- VEST.

How a Colony May Reach Maturity too Early for the Harvest, and thus Develop the Loafing and Swarming Mania; the Double-story Ten-frame Hive for the Prevention of Swarming, and the Busy Man who hasn't the Time to Equalize Brood.

BY E. D. TOWNSEND.

["The ideal colony must not be over-populous. A hive is over-populous when its working force is too great in comparison to the dimension of the hive and to the number of wax-building bees.

"Such a condition is intolerable to the bees, and they try to help themselves by loafing. Their instinct teaches them to begin this loafing even before the hive is over-populous. The bees seem to see the combs are filled and capped, that the bees are daily hatching, and that they will soon be crowded. A colony in such a condition will never perform the wonders in gathering honey that we may expect from one less populous. Such a colony feels instinctively that its abode will soon be too small, and the swarming fever sets in; and we know that, when this is awakened, the bees will continue to loaf.

At the most, only as much honey will be gathered as is needed for making the swarming preparations. A colony with the swarming fever is of little value as a honey-gatherer."—GRAVENHORST.]

It is rarely that one finds so much in so few words as is expressed in the above quotation. The thought comes in here, that there is a condition involved that is hard for the average bee-keeper to comprehend—that is, if a colony of bees comes to its best or full working strength just two or three days before the honey-flow is on, that swarm is very likely not to store more than one-half as much surplus as one that comes to maturity just with the flow. This, of course, is with the supposition that neither one should cast a swarm.

The other, or medium-sized colony, may not have wintered quite as well as the other, but had a good queen that kept what workers there were in the colony just hustling to take care of what eggs she supplied, coupled with all the other work of the hive, so that there was not a single minute but that every bee in the hive had all it could do, and many times more. Such a colony is ready for the harvest when the season does open up.

Let us look inside of the other hive—the one that was ready before the harvest was on. They have come to maturity a few days too early for the season. Although they may not have any queen-cells started during this time, if you look down between the combs you will find little clusters of bees hanging together; and if the weather is warm, perhaps some may be seen crowding out at the entrance. These bees that have clustered in this hive have learned the art of shirking, and there is nothing to do but let them swarm, because that alone will bring back that energy and hustle they had before coming to this stage of stagnation that I have explained above.

The case cited above is, perhaps, an extreme one; but I assure you that bees do not have to come to this stage of development to be worth only half a colony from a surplus-honey view-point.

Some take brood from the strong to build up the weak, doing this previous to the honey-flow, with the express purpose of preventing this stagnation on the part of the strong, and at the same time building up the weak. Such procedure, if practiced in an intelligent manner, so that the weak and the strong shall be equalized, will produce good results, because none will be too strong too soon. When this is properly done they will all work with the energy of a newly hived swarm; then if there are still left more weak colonies than can be built up into colonies in time to take advantage of the honey-flow, such colonies can be allowed to build up into colonies of their own will, or they can be used in an almost unlimited number of ways at the option of the apiarist.

The shifting of brood by the inexperienced, for any reason whatever, should be done on a small scale, and for experimental purposes only.

Since I have been in the business more extensively, a different system of management has been found necessary; namely, a scheme for using double-story ten-frame hives. A system that is all right, and which works well with one home yard of bees, may not work at all with an outyard or with extensive bee-keeping where more bees are kept than the apiarist himself can care for, necessitating the work being done by others, and these, many times, perhaps of small experience.

It is a fact that a very large hive containing an amount of honey in excess of that needed to carry the colony through spring, with an abundance of comb room, will not swarm nor acquire the swarming fever until the honey season is on, when the bees, assisted by the queen, get the hive nearly full of brood and honey.

A ten-frame Langstroth hive, two stories high, is ample in size to hold back the swarming fever until the white-honey season is on in June. Colonies in such a hive, that are good to strong, during the period of warm weather previous to the honey-flow, usually commence to store honey in this location about May 20. With so much clustering room, such as these hives afford, no swarming fever will be induced.

When the warm weather of the last part of May arrives, an upper story is given our medium to strong colonies, either with or without a queen-excluder, depending on whether it is a yard where excluders are used or not. Our honey season usually commences during the second or third week of June, in this location. As there is no honey-flow previous to the main clover flow in June, sufficient to cause bees to contract the swarming fever, the ten-frame hive used two-story during practically all of the hot weather previous to the honey-flow, keeps our bees practically free from the swarming fever, and without handling a single brood-comb.

This system is well adapted to the eight-frame hive or smaller hives, only the second story should be of worker comb, and the queen allowed full sway through both stories. Later on, after the bees get to work in dead earnest, if one likes, the queen can be put down into the lower story, and an excluder placed on the lower story, since the bees have now almost forgotten there is such a thing as swarming, being so intent on the securing of the abundance of honey that ought to be coming at this time. Moreover, with the Italian bee this is the season of the year, or the season has now shaped itself so that one eight-frame story is all (and usually more than) the queen will occupy with brood, because the bees are so intent on storing honey.

This same principle of giving abundance of comb room during hot weather, previous to the main honey-flow, with the idea of preventing the bees from thinking about swarming, is carried out with our comb-honey as well as with our extracting colonies.

In the case of the comb-honey bees, any empty brood-nests are used for the purpose

of this extra room. Then we have provided about half as many sets of shallow extracting-combs as we have colonies of bees in the yard, which are used to finish up the season in the production of comb honey, and also to give clustering room previous to the season, as I have explained above.

Remus, Mich.

SPRING MANAGEMENT.

Building Up Colonies for the Honey-flow; a Unique Scheme of Exchanging Brood between Weak and Strong Colonies.

BY OREL L. HERSHISER.

Continued from last issue.

The queen in each colony of class three will soon fill as many combs with eggs as the colony can incubate, and her usefulness in bee production for work in the rapidly approaching harvest will be curtailed unless provision is promptly made for her. We will, therefore, remove two combs of eggs from each of the colonies of class three which is sufficient to give one each to all those in class two in exchange for as many empty combs which are used to fill up the empty spaces in the hives of class three from which the combs of eggs have been removed. A few days thereafter the colonies of class two may again be reinforced by a second installment of eggs from the colonies of class three in exchange for empty combs. By this time practically all the brood that was in the combs at the time they were taken from the colonies of class one and given to class three will have emerged, and the additional nurse-bees thus afforded, together with the more favorable weather conditions that usually obtain with the advancing season, will enable the colonies of class three to nurture the young and incubate the eggs as fast as the queen can produce them; and we have so strengthened all the colonies of class two by the reinforcements of eggs from the twenty-five weak colonies as to bring them up to prime condition in good time for the honey harvest. If any of them should be still lacking they may be at once strengthened by the addition of combs of capped or hatching brood (not eggs) from the colonies of class three just before the honey-flow commences, class three having a goodly supply of such combs by reason of having kept those first given them from the strong colonies filled with brood.

Having thus brought all the colonies of class two up to the honey-flow in prime condition, let us see what may be done in order to realize some further profit from the colonies of class three. It is a fact that many bee-keepers might profitably recognize, that one strong colony that will yield a good surplus is better and more valuable, so far as honey production is concerned, than a large number of weak colonies that yield nothing. What, then, is the use of these twenty-five weak colonies from which we have been continuously and systematically taking most of

the eggs the queen could produce, but which, notwithstanding, have gradually attained a strength of from two to four combs of eggs and brood each? None of them are strong enough for the honey-flow now almost at hand, yet in the aggregate there are enough bees about to emerge, which, together with those already on the wing, would still make considerable profits in honey if they were properly assembled. Let us select eight of the best of them and use the entire brood force of the remaining seventeen in bringing the eight up to surplus-producers. We have now brought fifty-eight of the original non-surplus-honey producers up to the harvest in the best possible condition by having availed ourselves of almost the maximum egg-producing capacity of all our queens.

We have, undoubtedly, defeated swarming in a number of the original strong colonies, but have probably induced it in a corresponding number of the best of the colonies in class two, and we may assume that the increase by swarms, either natural or forced, as a result of these manipulations, has been neither increased nor decreased. Having greatly weakened the last seventeen of the colonies of class three we will have swarms with them, selecting the best queen as between the swarm and the colony. By so using seventeen of our twenty-five swarms we shall get all our remaining colonies of the third class so strong as to gather an abundance of stores for winter, as will also the other eight swarms placed in empty hives. In the good season assumed, the twenty-five original strong colonies and the fifty-eight that have been made strong by manipulations, eighty-three in all, will gather 100 lbs. surplus each, or a total of 8300 lbs. Some of the swarms will produce surplus honey; but as the amount of surplus from the parent colony has been decreased by reason of this swarming during the main honey-flow it is fair to assume that the honey gained from the swarms is equivalent to that lost by the parent colonies, and that all have enough honey in the brood-chamber for winter by the end of the harvest.

Assume this apiary in the early spring, and the season and location to have been on an equality with the ones in the first illustration. The first apiary having produced 2500 lbs., and an increase of 8 colonies, or 108 colonies fall count, and the second, by systematic manipulation, we have brought to yield 8300 lbs. and an increase of 8 colonies, or 108 colonies fall count; then the total net gain as the reward for our pains in building up the colonies for the honey-flow is 5800 lbs. Surely that is liberal compensation.

The above illustrations are assumed in order to illustrate clearly the possibilities of careful and systematic manipulations, conducted with thoughtful care and with a definite object in view. It may be unnecessary to state that rarely if ever will the exact number or the proportion of strong, medium, and weak colonies, assumed in these illustrations, fall within the experience of the bee-keeper. It is hoped, however, that the

assumed examples will serve to emphasize the golden rule of apiculture, namely, *supply to all the queens the conditions necessary for reproduction to their fullest capacity during the time that will bring the workers to the honey harvest at the most vigorous age.*

Commenting on an outline of this plan of building up weak colonies, heretofore published, J. L. Byer, writing in *Canadian Bee Journal*, remarks that this has always appeared to him to be too much of the robbing-Peter-to-pay-Paul nature, and he doubts if so much time spent in manipulation is paid for in the end. His comparison is at fault, for both Peter and Paul (the colonies of bees) are the property of the bee-keeper, and there can be no robbery in making an advantageous disposition of one's own property. I suggest a better comparison. The apiarist, being possessed of certain talents (his colonies of bees), is justified by a high sense of duty to himself and to all in making such disposition of them as will yield him the greatest profit. If he has a colony containing a choice queen which he contemplates moving from an outyard to his home for breeding purposes, but, upon making a trip for the purpose, finds she has absconded with a large swarm, Peter has been robbed, but Paul has not been paid; and the bee-keeper who has not made the best use of his talent has suffered a loss. Far better to have done a little manipulating to build up some weaker colony with brood that could be spared without impairing the usefulness of the strong, and, incidentally, retard or defeat swarming.

The expedient of stimulative feeding may be very profitably employed after settled warm weather has commenced whenever there is a protracted honey-dearth, and especially after apple bloom, until white clover begins to yield nectar, ever urging the queen to keep everlastingly at it during this interim, for it is the bees reared at this time that will be of the greatest service a little later on. Very often the colonies that are strongest in the early spring are surpassed in honey-gathering by those of medium strength, which is probably due to the latter having a field force of workers of greater vigor, many of the former having reached the period of old age before the harvest is on.

Frequently bees winter with very light loss of stores, and in the spring the brood-chamber is clogged with honey to such an extent as to restrain the queen seriously at the time when she should be laying to her full capacity. In all such cases combs of honey should be removed and empty ones given in exchange, so the building-up of the colony may not be retarded. These combs of honey may be profitably used in outside stimulative feeding during any dearth of honey after apple-bloom, placing them some rods from the apiary for the bees to empty. However, if foul brood is in the locality, outside feeding of honey taken promiscuously from the hives should not be resorted to without caution.

Spreading brood is an expedient which,

on the whole, requires such careful judgment that it can not be recommended. Early in the spring it certainly is not advantageous, and later it is hardly necessary, as the bees and queen will attend to all that without assistance. But if it is felt that the brood must be spread, do it by placing the outside comb, in which the queen is laying, in the center of the brood-nest, making a place for it by moving the combs apart. This will not materially enlarge the brood-nest; and the fact that the queen is occupying this outside comb is some evidence that the colony can maintain the proper temperature over that portion of the brood-chamber.

Well-thought-out plans, systematically and practically applied, will often win success from what may seem hopelessly adverse conditions. Liberal reward by way of increased profits surely awaits the bee-keeper who gives systematic thought to his bees in the spring, and anticipates the honey-flow with thorough preparation of his colonies.

Buffalo, N. Y.

FEEDING FOR STIMULATING.

Spring Feeding to Stimulate Brood-rearing Wrong in Theory and Practice; Feeding in the Fall the Proper Time; Requeening More Important than Either; Ripening Honey on the Hives.

BY J. E. HAND.

I have read with considerable interest Mr. Alexander's article on spring feeding, page 1876, Nov. 1, 1907, especially since I have expressed somewhat opposite views upon this same subject, even going so far as to say that *spring tinkering with bees is a useless waste of time*, and that, if it is necessary to feed in order to stimulate brood-rearing in the spring, autumn is the time to do it instead of spring. I use the word "if" in the above connection because recent developments have led me to conclude that *feeding at any time to stimulate brood-rearing is unprofitable*, and is beginning at the wrong end of the problem to solve it.

If I had a queen that would not lay all the eggs that a colony of bees could care for during the breeding season I would reinforce her by adding another queen; and I consider this the proper thing to do instead of feeding all summer to try to force one queen to do the work that two could do without any fussing whatever.

On page 1318 Mr. Alexander says: "I can see no more consistency in feeding bees during September in order to induce spring brood-rearing than there would be in feeding our cows in July to increase the flow of milk the following May."

Mr. Alexander could not have hit upon a happier illustration than the cow, since these two cases are almost exactly parallel, only, in my mind, the application works just the other way. It is just as important to feed a cow during winter with a view to increasing

her flow of milk the following season as it is to feed bees during September to stimulate brood-rearing in the spring.

In the case of the bees, the surplus energy (the result of stimulative feeding during September) is stored up within the hive for future use in the form of a greatly increased force of young bees which, after all, is the greatest stimulant that can be imagined to induce early and constant brood-rearing the coming spring, and without which spring feeding would be in vain, since no feeding would be necessary to enable a queen to lay all the eggs a *weak* colony would care for.

With the cow, the surplus energy (the result of high feeding during the previous season) is stored up in the form of flesh and greatly increased vital force, all of which will enable her to turn a greater part of her food during the following season toward increasing her flow of milk instead of to the building-up of a body weakened by improper care and insufficient food during the past season. And such a cow will not have to be helped up in the spring any more than will such a colony of bees need feeding in the spring to stimulate brood-rearing.

I wish to go on record as saying that *if bee keepers would give their bees proper care and attention during the latter part of the season they would require very little attention during the following spring* until time to put on the sections, and weak colonies would be the exception instead of the rule.

Now I think I have made it quite clear that autumn feeding is ahead of spring feeding; yet there is something else of vastly more importance than either, and that is the *queen*. When it becomes necessary for the bee-keeper to feed his bees to stimulate brood-rearing during the *natural breeding season* you may depend upon it there is something radically wrong with his management. The queen is probably worthless, and she should be replaced by a good one reared on correct and scientific principles.

There are two points in Mr. Alexander's article that he does not make quite clear. One is, why he finds it necessary to have so much honey in his hives during winter as to interfere with the brood-nest the following spring; and the other is, why does the uncapping of sealed combs, if properly done, induce robbing any more than feeding would?

THE SUPREME IMPORTANCE OF HAVING HONEY WELL RIPENED.

Regarding the statement that it is not necessary to have more than one set of extracting-combs on a colony at a time, I can, perhaps, better express my views by quoting R. A. Burnett & Co.'s statement to the effect that, *if bee-keepers would allow their honey to ripen upon the hives it would do more toward creating a demand for it than any law against adulteration*. And I will add to this that, if every bee-keeper in the country would read this until he can repeat it with his eyes shut, and then put music to it, and learn to sing it and whistle it, and then paste it all over his hives, extracted honey would soon

sell for very nearly as much as comb, and it would be better worth the price than it is today.

Birmingham, O.

[Our correspondent has made some very good points, some of which we have taken the liberty of italicising in order that the reader may be sure to see them.

We can only repeat, as we have already done, that in considering the Alexander methods we must take into consideration his peculiar environments, and the fact that his main honey-flow begins some weeks after the honey-flow of most bee-keepers in the Northern States comes on.—ED.]

WOODEN SPLINTS VERSUS WIRES IN FRAMES.

The Comparative Advantages of Each.

BY DR. C. C. MILLER.

A correspondent asks me to reply in GLEANINGS to some questions about foundation-splints. These questions are mainly answered in a slip that The A. I. Root Co. sends out with the splints; but in view of an awakening interest in foundation-splints it may be well for me not only to answer them here but to discuss the whole subject quite fully.

I do not think of any advantages that wiring has over splints, and I do know of advantages that the splints have over wiring. With horizontal wiring there is testimony to stretching of the foundation. Although this testimony is pretty general, there are probably thousands of bee-keepers who have never suspected any evil results from horizontal wiring, and yet the evil results are there all the same. Sometimes the stretching is enough so that drone brood will be found in several rows of cells under the top-bar. Of course, this will be noticed; but oftener the stretching, while not enough to allow the cells to be used for drone brood, is enough to prevent them from being used for worker brood.

I remember one very good authority saying that, with the Langstroth frame, there would always be something like two inches of honey between the brood and the top-bar. This is probably quite generally true, because horizontal wiring is in general use, and the cells for some distance under the top-bars are so stretched that the queen will not use them. But with perfect worker-cells under top-bars there will be no such margin of honey. In the height of the queen's laying I'll show you frame after frame with the brood clear up to the top-bar—not a cell of honey between brood and top-bar. Later on in the season, as the honey encroaches on the brood-nest it will encroach at top as well as sides.

Is there any need to discuss horizontal wiring further, so long as splints give perfect worker-cells clear to the top-bar?

But what about vertical wiring? I've had

hundreds of frames wired vertically, and the cells under the top-bar were faultless. But in order to have the wires sufficiently taut to be straight, the stretching bowed the bottom-bars. This, while in reality changing the depth of the frame, made it practically impossible to bring the foundation clear down to the bottom-bars unless the foundation were cut curving—a difficult thing to do, seeing no two curves were alike. Vertical wiring might do all right with bottom-bars $\frac{3}{4}$ thick, but that is hardly desirable.

I have not mentioned all the objections to wiring, but is it necessary? Better tell about splints.

Foundation-splints are made of basswood—for any thing I know, other wood would do—about $\frac{1}{16}$ of an inch square, and about $\frac{1}{2}$ inch shorter than the distance between top and bottom bars. They might be made long enough to touch at both top and bottom, but that would make slow work about putting in. For each frame of usual length, five splints are used, placed vertically.

Take a shallow dish—a square pie-tin is good; put in it enough beeswax so that, when melted, it will be $\frac{1}{2}$ inch or so deep. Put in enough splints so the dish will not be too crowded, and it will froth up by means of the steam from the moisture in the wood. When it stops frothing you are ready to operate. The heat should be properly graduated, either on a kerosene, gasoline, or some other stove, so that the wax shall not be kept too hot, otherwise not enough wax will cling to the splint to coat it. If too cold it will not be easily cemented to the foundation. So long as the wax is kept liquid it is not likely to be too cold. The work should be done on a hot day or else in a hot room, so the foundation will be soft.

Wiring is done before the foundation is put in the frame. Splinting, on the contrary, is done the last thing, the foundation being fastened in whatever way to the top-bar, and being cut large enough to fit close to the bottom-bar and end-bars. It is a little better to have a divided bottom-bar, as in the Miller frame, so the foundation shall go down between the two parts of the bottom-bar; but with a plain bottom-bar the foundation merely comes down to the bar.

Take a board that will fit easily inside the frame, perhaps $\frac{1}{2}$ inch smaller than the inside dimensions, and put stops on the edges so the foundation shall just rest on the board. It will make the work a little easier if you have on the board a mark where each splint is to go, a straight black line heavy enough to show through the foundation. There is to be a splint an inch or so from each end, a splint in the middle, and a splint midway between the center and each end splint.

With a small pair of nippers having square jaws, pick up a splint by the center out of the hot wax and lay it in place. It doesn't matter whether it touches the top-bar or the bottom-bar, or whether it is part way between. Don't fret if you don't lay it within an inch of the right place. In the hot room it isn't going to cool right away, and you can

shove it into place with the end of your nippers. But after a little practice you'll drop it in the right place first time, and do it very rapidly. As soon as you put it in place, an assistant presses it slightly into the foundation with the edge of a thin board kept constantly wet. That's all; the bees will do the rest.

By the aid of these splints I can show you beautiful combs built clear down to the bottom-bars—not a pop-hole anywhere. But I can show you lots in which the bees have more or less gnawed away the foundation so as to make a passage between the comb and bottom-bar. That's because the frames were given when they ought not to have been given—in a poor year when bees were doing little or nothing. If you want combs built down to the bottom, get them built and finished at a time when the bees are storing.

"Do the splints interfere with the laying of the queen?" Not in the least. When the brood is sealed, with the comb in the right light you can see a slight ridge where the splint is, but it can do no possible harm.

I think that is all; but if any one has further questions I'll be glad to answer them.

The same correspondent asks, "What is your plan for controlling increase in producing extracted honey?" I work altogether for comb honey. But if I tried for extracted I'd have large hives *with abundant ventilation at each story*. With room enough and ventilation enough I should expect swarming to be pretty well controlled. I might also try the Demaree plan: Just before swarming time raise all brood into an upper story over an excluder, leaving the queen in the lower story with empty combs or foundation. Marengo, Ill.

[It is said that "confession is good for the soul." We are frank to acknowledge that we did not take kindly to Dr. Miller's wooden splints when he first wrote about them some years ago; but in view of the complaints of a slight sagging due to horizontal wiring, resulting in the building of drone-cells at the top of the comb, and in view of the further fact that vertical wiring with thick top-bars is not practicable, we are now inclined to look with favor on the Miller wooden splints. Dr. Miller has improved his method of applying them, and the difficulty of manufacturing them in the first place has been largely overcome, so that now the two main objections which we originally offered have disappeared. The wooden splints are cheap, and easily applied, if we may judge from the description given by Dr. Miller. We have seen a good many of Dr. Miller's combs stayed as he recommends; and a finer lot, filled clear out to the wood, without pop-holes or drone cells, can not be found in this country.

The very argument that Dr. Miller presents in favor of foundation cut to fit *brood-frames* applies with equal force to foundation cut to fit *sections*. Why? If a neatly fitting sheet prevents pop-holes and passages in the one case, why should they not

in the other? G. J. Yoder, in this issue, explains how in the ordinary section one can fasten foundation and cut it to fit so it will not buckle. If there is any thing in this scheme, or in that of Mr. J. E. Hand, it goes without saying that by either plan we shall be able to secure a much larger percentage of No. 1 and fancy comb honey. When we remember that the fancy always sells at a good price, and that a really fine article of No. 1 follows next, it is apparent that foundation making contact with all sides of a section probably means dollars and dollars to the bee-keeper, with practically no extra cost in foundation, and with perhaps a little extra time.—Ed.]

PRESERVING HIVES.

How and When to Paint; What Paint to Use; Metal and Paper Covers.

BY F. GREINER.

To justify us in saying very much about painting hives it must be conceded that covering a hive with paint does no injury to the bees within it, and that, at the same time, it is a paying investment. The latter question, I believe, we could as well dismiss without argument. With the price of lumber as it was 35 years ago there might have been reason for not painting hives and houses, for it was cheaper to replace than to keep constantly painting, providing we cared nothing for looks; but with lumber at from \$30 to \$45 per 1000 we can well afford to keep hives and houses painted.

As to the first question, I have come to the conclusion that bees do not suffer in painted hives any more than in unpainted ones. I have watched the cellar-wintered bees in the unpainted hives and in those painted; and with the amount of ventilation they have in my rather dry cellar the combs and bees come out as dry and as well otherwise in one as in the other. As I have settled on wintering outdoors with upward ventilation through a thick packing, there is never an excess of moisture nor an uncomfortable condition on this account in my hives, painted or not painted. So far as I am concerned I want to keep my hives painted, and I believe a large majority of bee-keepers concur with my conclusion.

The larger part of my work along this line has been repainting rather than painting new work, and I will more explicitly deal with this in my article.

As to the color, a light one is to be preferred. Dark draws the heat to an undesirable degree, although with chaff hives the difference is not so marked. A very smooth glossy surface is not to the liking of the bee, perhaps in more than one way. For this reason I never give more than two coats of paint to new work—the first a very thin coat, the next a rather heavy one. I also practice covering the fresh newly applied paint with fine sand or cement, particularly the front of each hive, and slanting alighting-boards

if the latter are painted at all. A rough surface enables the bees to get a better foothold, saves bees and bee time, and the bee is not dazzled by a white glaring paint (the last is only theory).

As to what kind of paint to use, this is a perplexing question to answer, as we have difficulty in obtaining the same grade of paint each time. I have used white lead and raw oil with a very little japan drier added, and it wore very well. At other times it either scaled off or rubbed off as dust (I should prefer a paint which had the last-named fault rather than the first, as it would last very much longer). The trouble seems to be either in the oil or in the lead. Perhaps adulterants have been used at times with one or the other. An addition of zinc is an improvement on the paint; still, I use it very seldom, and only in the ready-mixed paints. I have never used the dry-powder (water) paints on account of lack of faith; but I should like to hear from some who have used it for hive-painting, or any other work, as to its protecting power, lasting qualities, etc.

HIVES CAN BE PAINTED WITH BEES IN.

In repainting old work I do not wish to go to the trouble of taking the bees out of their hives. When hives needing paint become unoccupied, then, of course, is a good time to repaint them; but this does not occur often, and generally we do not wish it to; consequently the most of my repainting is done with the bees in the hives. A good time is when we are not very busy with other work, either early in spring or in the fall of the year. As much of the old loose paint, propolis, wasp-nests, spiderwebs, etc., as possible should at first be removed. For this purpose nothing is better fitted than a cabinet-maker's steel, which also answers for cleaning separators and the insides of our supers and hives. A worn-out crosscut saw will make a good many such "steels." I have cut a number of them about 3x6 inches, filed straight and perfectly square. They come very handy in the shop and yard. We can dig with them into the corners, and scrape off all the loose paint and accumulations very quickly. It is necessary to give the colony in the hive to be treated a little smoke, even if it should not be warm enough for bees to fly. As soon as cleaned, and surface is dry, the paint may be applied with a medium-sized flat brush. At certain seasons of the year the bees may not trouble any at the entrance. If they should, it might be well to remove the bottom-board, exchanging it for one already painted, or wait for the bees to retreat, perhaps finishing the job with a few strokes after they have become quiet, and then sprinkling a little fine sand upon the green paint. This will prevent any of the bees from becoming daubed very much. I use a little more drier when repainting in this manner than when doing up new work, for obvious reasons. The bottom-boards are giving me the most trouble to preserve, and constitute nearly all there is about a hive to give out.

I am anxious to find a preservative not obnoxious to the bees; and, by the way, I want the bottom-boards of hives made of fully as heavy lumber as any other part. I could give quite a number of reasons for this.

The paint on the roofs gives out the quickest, and needs replacing frequently, unless, indeed, metal is used, which needs no paint whatever. No metal answers the purpose better than zinc. Next would be zinc-coated iron (galvanized). I am confident that such metal roofs are the cheapest for bee-hives, in the long run. On account of the temporary cheapness I have used roofing-paper, tarred and otherwise. The Neponset has given me the best service. By giving two coats of oil they have lasted ten years and are good now. Perhaps they should be painted. The weak feature is that paper roofs do not stand rough usage. In carting them about, the paper sometimes is torn. They must be handled with care.

A point about covering wood covers with paper or metal is this: "Cover the edges of the boards as well, and do it thoroughly, or water will be driven in and under the covering, which will soon rot out the wooden portion of the cover, thus causing a loss and lots of trouble. I have used different kinds of paints on the flat wooden roofs; but all will give out in two or three years. Sanding has not proved to be any help, as I had hoped. If we keep any part of the hive painted it certainly should be the roof, and white is to be preferred, particularly if only a single thickness of lumber is between the bees and the outside. I can hardly understand why others have no trouble with such an arrangement. I have, only a few times, left some hives uncovered by accident or oversight, this happening when the sun shone upon the hives during the noon hour. The result was the loss of a super of honey, not counting the injury to the bees in each and every case. One thickness of board (these spoken of were unpainted) is not enough protection against the hot rays of the sun; but if that is all the protection given, perhaps the white paint would lessen the effect.

I should have mentioned the advantage of repainting hives when no bees are in them: viz., that we can then drive a few nails where needed. Boards will check and warp some, particularly with my hives, which are only nailed together—no lock corners, no halving—just butted together. These hives stand the wear well, but need a few nails occasionally. It must, however, be said that only those of recent make are put together with cement-coated nails. Formerly only the smooth nails were procurable, and finish nails, either wire or cut, were used.

My supers, which are housed when not in use, will never again need paint, or nails either, so it would seem, although many have seen thirty years' use.

In regard to paint-brushes, I want to add, be careful how you leave them. Keep them in oil "suspended," not standing on the bristles. Just keeping them in water will do; but the make of brushes we have now

will rust out in a little while if thus kept. Oil prevents it, and does not evaporate.
Naples, N. Y.

[We desire to indorse in the main the statement made by our correspondent, especially when he says he prefers a paint that will powder or chalk rather than one that will scale off from the wood. A pure lead, after it has been on for two or more years, is liable to powder, while a lead-zinc paint will scale. In most localities a pure white lead will give better results than one containing a percentage of zinc. The majority of the ready-mixed paints contain some zinc. The purpose of the latter is not to adulterate or cheapen, but to give a harder and glossier finish; but in localities subject to a hot burning sun in summer preceded by a large amount of humidity, the zinc paints should be avoided. While they give a hard surface, that very hardness causes the paint to flake off in scales; then when the wood is repainted it has a smallpox appearance. But that is not all. The paint that did not flake off will, after the repainting, sooner or later come off, taking with it the top coat. On the other hand, if a pure lead paint be used, when the surface becomes old it will chalk off, or powder; but on a fresh application of another lead coat this powder will unite with the oil, serving to strengthen the paint, making the surface smooth, and as good as it was on the first coat.]

The first coat of any paint should be put on very thin, as Mr. Greiner recommends. The surface of the wood should be dry and clean; the second coat should be put on thicker, of course. In buying lead paints, make the seller put up a guarantee to refund the pay if the paint flakes off in scales at the end of three or four years. Another thing, do not try to buy a cheap lead. The national pure-food law does not apply to any thing but food and drugs, and the dealer may sell you adulterated paints without fear of prosecution, hence make him put up a guarantee.

As Mr. Greiner states, we have painted hives while the bees were in them. The alighting-boards are usually painted at night. The paint will set enough before morning to cause no inconvenience on the part of the bees.

This article is seasonable, because in the spring, when it is too chilly to do other work in the apiary, one can paint all his hives—both occupied and unoccupied.

We agree with our correspondent that it is economy to use paint; for the high price of lumber, which is constantly going up, makes it more necessary than ever to preserve it. Then if any one wishes to sell any colonies, or his whole yard, nice bright painted stock will bring a far better price than that which is unpainted.

Paint made of Portland cement and oil has been suggested several times in our columns. See p. 230, Feb. 15, 1906; also p. 715, May 15, 1907. From tests that we have made, we have concluded that such preparations are worth investigating.—ED.]

We acknowledge the receipt of an excellent annual report of work done at the agricultural experiment station on the island of Tortola, one of the Virgin Isles, West Indies. It contains some excellent views of the island, and is well gotten up. Tortola is excellent for bee-keeping, and has the reputation of being very healthy. It is easily reached via St. Thomas, Danish West Indies. The price of this report is six cents.

A NEW WORK ON BEE HISTORY.

We have received a small book containing a brilliant contribution to the history of bees and bee-keeping from the earliest days down to the present time by the editor of *Pfalzer Bienenzeitung*, Mr. Ph. Reidenbach. This was originally given at the golden jubilee celebration of the Pfalzer Bee-keepers' Association last summer. The author shows a very comprehensive grasp of the whole history of bee-keeping, in addition to which he wields a facile pen. The brochure is adorned with portraits of Georg Pictorius (1041 A. D.), Freiherr von Ehrenfels, Mehring, Dzierzon, Berlepsch, and Leuchart. The work comprises only 44 pages; but the author has managed to compress within the space allotted to him a mass of valuable information which required much research to discover. Copies may be obtained from the office of the above journal at Rehborn (Pfalz), Germany. The price is one mark.

A SWISS APIARY.

On the next page the reader's attention is directed to the characteristic view of an apiary in Switzerland, a country to which all modern bee-keepers look with veneration as the classic land of bee-keeping—the home and nativity of Huber, the prince of bee-keepers. Switzerland, certainly, is a land of science. No other country is so sincere in its affection for the cause of truth. Of course, it is a small country in area and population; but in ideas it is not small, and it has given to the world a host of illustrious men. At present it is a hotbed of advanced ideas on bee-keeping, led on by such men as Kramer and Goldi; and the Swiss never seem to lack illustrious men to lead them forward. A few years ago they had Bertrand and Dr. von Planta. It would be a grand thing if feverish America would catch on and hold fast to the scientific spirit which characterizes the Swiss people in all their actions.

SWISS BEE-STATION AT DAVOS.

MEMBERS OF THE MICHIGAN STATE BEE-KEEPERS CONVENTION, HELD AT SAGINAW, DEC. 18 TO 20, 1907.

The report of this convention appeared on page 99 of the Jan. 15th issue.

BEE-KEEPING IN GEORGIA.

Colonies on Elevated Platforms.

BY J. L. PATTERSON.

I keep my apiary on elevated platforms as shown in the engraving. The hives do not rot so fast, and frogs, ants, spiders, etc., can not get into them. The bees are also

more easily kept out of water or away from the sand, which often beats against the hives with the wind.

Last year I averaged 30 lbs. of honey to the hive; but this year I did not do so well, for there was an average of only 10 lbs. to the hive. Two of the extracting-hives contained $2\frac{1}{2}$ gallons of honey each. In a poor season the very strongest colonies store their

J. L. PATTERSON'S ELEVATED APIARY, AT AUGUSTA GA.

hives full of honey while the weaker ones live on through the season without storing extra honey.

There were only two days last season when the bees did not fly out of their hives. It was a warm winter.

Augusta, Ga.

BEE-KEEPING IN BRITISH GUIANA.

BY W. K. MORRISON.

The picture here of an apiary in the city of Georgetown, British Guiana, is almost self-explanatory. The hives are raised on stilts to prevent the very large frogs from

which are as large as a buggy-wheel. These rest on the water, and are beautifully green. The flowers are at night like stars on the surface of the canals. Mangrove swamps near by help the bee-keepers to make both ends meet; but there are many other flowers, such as cocoanut, royal palm, poinciana, etc. Though low and swampy, the city is not unhealthy; but it possesses one of the largest hospitals in the world.

When the writer saw this apiary it was on a roof over a grocery and provision store, but it was rather too hot for the comfort of the bees or the owner. I think the owner, Mr. Faraz, is a native of the island of Madeira, a beautiful tropic land off the coast of Africa, ruled by the crown of Portugal.

ANTONIO FARAZ IN HIS APIARY IN SOUTH AMERICA.

leaping up to the entrance and devouring all the bees. If the reader thinks this is an imaginary evil he is mistaken, for I cut one open which had been at a hive for some time; and, so far as I could judge by counting the bee-heads in its stomach, it had just consumed 400 bees.

The city of Georgetown is intersected with canals, and these make splendid breeding-grounds for the frogs. Despite this fact, the city is a hot-bed of bee-keepers, and for its size I should say it had more bees than any other city in the world. The bee-keepers, however, get fair results; but during the rainy season they are obliged to feed liberally to save their bees.

One of their honey-plants is the wonderful water-lily—the *Victoria Regia*, the leaves of

THE BREEDING OF QUEENS.

Is the Time of the Year and the Manner in which a Queen is Reared of more Importance than her Pedigree?

BY J. A. CRANE.

I have watched with much interest the tilts between Dr. Miller and the editor of *GLEANINGS* with reference to the advisability of breeding from pure stock as the best honey-gatherers irrespective of race or color. I have been experimenting along the same line for several years, and my conclusion is I would rather have a carefully reared queen from my poorest stock than a poor or ordinary one reared from the best stock in the country. I would also rather have a queen

S. E. KLEIN'S APIARY, INDIANA, PA.—SEE NEXT PAGE.

raised during basswood bloom than any other season except it might be a supersedure queen at almost any time. I also much prefer swarming-cells to any artificial kind.

I have bought but two good queens in my life, and can not say for sure that they were both good, as the bees superseded one of them the same season; but the daughter of that one, mated to a drone from the stock of the other, making a red-clover golden cross, was the best queen ever in my yard. She was the early bird every time. Her bees filled five supers of extracting-combs during apple bloom in 1906, weighing 90 lbs., and cast a large swarm, and three supers in 1907, when she would have been four years old in August; but she was missing in June, and the bees raised a new one from the brood. I have raised a few queens from her, and they are very fair; but not one of them can come up to her.

I have also a queen received as a premium in 1904 that I have relied on for my breeding-queen because of the gentleness of her bees; but in very few cases do her daughters produce extra-gentle bees; but she made a honey record the next season after I got her, and has never swarmed, and I have more than fifty of her daughters in my yard. I produce nearly all extracted honey, and her stock nearly all cap their honey greasy, so it

is readily seen they are hustlers. But my point is this: A queen raised in a full colony from the egg, without hurry, and only two or three cells allowed, and raised during basswood, will give you something that is worth money, even if they never had a pedigree. I prefer, though, to breed from pure blood on the mother's side, and let the queens mate as may happen. The main reason why I prefer Italian to the blacks is the ease in finding queens, as I use a queen only two years unless she is extra good, and only one if she proves in any way slow.

Another reason is, I have no wax-moths or worms in my combs. Since I have had no queens except pure Italian, no matter how mated, I have never had to fumigate a comb, and can leave empty combs around very carelessly all summer, and they will not be seriously damaged. I can keep queenless colonies all summer by giving brood to keep them stocked, and the worms do not do any harm.

Alexander's method is of no use to me, because I want an early brooder to get the apple-blossom honey, while his surplus comes in August, when my bees have nothing to do but bother the berry-pickers.

If I could not get the apple-blossom honey I would not keep bees in this locality for all there is to be had the rest of the season.

This requires extra-prolific queens which get to business early in the season and lay late in fall. It does not take as many bees to get a lot of honey from apple bloom as from clover; but they seldom are in condition to build much comb, but will fill a super in a hurry in good weather.

Marion, N. Y.

[If the bees fill the cells so completely with honey that there is no air-space next to the cappings the surface of the comb will have a transparent, watery appearance, or "greasy" as you call it on the preceding page. It is often stated that some Italians have this trait; but have any data ever been collected which would show that bees which cap the honey watery are *always* hustlers? We should be glad to hear from our readers on this point. —Ed.]

NINE YEARS OF SUCCESS.

Bee-keeping in Connection with Farming.

BY J. E. KLINE.

I produce comb honey, and that only. When the honey is taken off I am careful to see that the colonies are all right, with plenty of stores, and then pack ready for winter. I do not lose three per cent.

I live near a county-seat of nearly ten thousand inhabitants, and am well known to the business men of the town. By treat-

ing my customers courteously, and giving a square deal, I have steadily built up a large trade which now takes, to supply it, thousands of pounds of purest and best honey bees can produce.

At present I am on a large farm, and am giving my attention to both pursuits. I give my bees the same care that I give to the rest of the stock; but in the near future I expect to give all my time to a largely increased apiary.

Indiana, Pa.

SECTIONS PERFECTLY FILLED.

How to Put in Full Sheets of Foundation Cut to a Fit, and yet Avoid Buckling: How One Man has Worked Out the Problem.

BY G. J. YODER.

[We are reproducing, for the convenience of our readers, the cuts we published at the time Mr. Yoder described this originally in GLEANINGS for May 15, 1904.—Ed.]

I was interested in the discussion in the Jan. 15th issue, p. 82, on the subject of sections and full sheets of foundation, for I think it is well for us to put forth every effort for the perfecting of this plan. If the section is never so nice, and the filling and finishing imperfect, our profits will be greatly diminished. In the first place, it is unwise to attempt to fasten a full sheet of

FIG. 1.—YODER'S PLAN OF FASTENING FULL SHEETS OF FOUNDATION ON THREE SIDES.

FIG. 2.—FASTENING FULL SHEETS OF FOUNDATION ON THREE SIDES.
By using this method it was found that buckling was prevented.

foundation on all sides of a section unless it is placed in such a position that it can not spring either way until it is filled and finished by the bees. This is easily accomplished by following the directions and illustrations we gave in the May 15th issue of *GLEANINGS* for 1904.

Cut a light board about three inches longer than the width of four sections, and just the width of the inside of the section. Now cut four square blocks of such a size that folded sections can slip over them, and a fraction less in thickness than the width of the section. Nail the first block $1\frac{1}{2}$ inches from the end of the board, and place a section over it. Put block No. 2, with section over it, next to No. 1, and so on till all are nailed on. Make at least five or six of these forms with blocks on. Next make a trough the width of the board of the form without the sections, and 2 inches deep, so the form will slip in easily to the depth of the blocks. I next melt some wax for fastening the foundation, using about one-tenth part of clean rosin, and have ready a wax-tube or teaspoon with the end bent in on both sides.

If possible, get the foundation cut by the manufacturer, so that all sheets will make a given number of uniform starters with as little waste as possible. The three last seasons I have been unable to buy starters cut just right, and so have had a loss of one-

seventh of the foundation for the crop of 20,000 sections.

Put the sections on a form, and spring the section-holder over them. This makes them square and tight. Place the foundation in clear to the top of the section. I prefer a $\frac{1}{4}$ space between the lower end of the foundation and the bottom of the section, as this is just about the amount needed to take up any possible sagging, and to prevent the buckling of the foundation. Now grasp the form in such a way that the top part of the section is lowest, and apply the melted wax on the section at the edge of the foundation, turning the form so as to run the wax all around as far as wanted. If all four sides are waxed, the weather warm, and the honey coming in fast, there may be a bulge at the lower part of the section; so of late we prefer to cut the starter full size, $\frac{1}{4}$ inch short at the bottom, and to wax the top and only two-thirds down each side. Lay this filled form down to cool, and take the next, giving the wax of the first four sections a few minutes' time to harden. Then place the form over the trough; press the tray down out of the sections and you will have the wide frame of sections, and with the foundation ready for the super without danger of buckling.

If every thing is made right, this method of fastening foundation is not very slow, as we have had over 3000 starters fastened in a

day by one man. Out of the crop of 12,000 sections the past season, I have had in proportion fewer imperfectly finished than ever before.

Our bees did very well the past season. From a little over 200 colonies I took 12,000 sections and 4 tons of extracted honey. I did all the work and manipulating myself, up to casing and extracting. I am 64 years *young*.

Meridian, Idaho, Jan. 23.

[We had quite forgotten the fact that Mr. Yoder described this same method of using sheets of foundation cut to a scant fit, nearly four years ago. Indeed, his method is similar to the one that we have been advocating of late, except that he advises fastening on only three sides, leaving the bottom untouched. We are inclined to believe that he is right.

The use of full sheets of foundation cut to a fit, will, if the buckling difficulty can be overcome, give a more nearly fancy grade of honey than where a small starter is used, or a full sheet leaving a bee-space all around it except, of course, at the top. While Dr. Miller's method of using two starters, one at the top and one at the bottom, makes a good fastening at the base, it still leaves a chance for pop-holes and bee-spaces in the comb at the sides. It occurs to us that it might be possible for us to combine the Yoder and the Miller method, using two starters both cut a scant width of the section, but so as to leave a small gap between when fastened in the sections. Of course, it goes without saying that a close fitting sheet of foundation in a section while on the hive must be held perfectly square, leaving no chance for the foundation to buckle.—E.D.]

HONEY EXHIBITS AT FAIRS.

A Successful Display at Salt Lake City.

BY F. W. REDFIELD.

At our exhibit at the State Fair in Salt Lake City this year, Sept. 30 to Oct. 5, we had 13 observation hives of bees, a large assortment of goods at each end of our space, besides a big display of honey. The picture does not do justice to the exhibit, as so little of it can be seen. The comb-honey house was lit up with electric lights, and showed off to good advantage. The decorations were in purple and gold, the same colors that we use on our labels for tins. The space occupied was 30 by 15 feet, and our display drew more people than any other on the grounds. The walk was continually packed with people admiring the honey, over \$50 worth of which was sold right there. The rest went at the close of the fair, and

HONEY EXHIBIT AT THE STATE FAIR IN SALT LAKE CITY, UTAH, SEPT. 30 TO OCT. 5.

we took orders for twice the amount on display, which we shipped down after the fair closed.

Ogden, Utah.

THE IMPROVEMENT OF THE HONEY-BEE.

Pure Races should be Selected, since the Good Points of the Crosses may Not be Perpetuated; Not Desirable to Breed for too many Points.

BY C. F. BENDER.

I have had good results from careful breeding, taking a good strain to begin with, and I see no reason why any painstaking person could not do the same. There are a few, even among the ranks of bee-keepers, who argue that there is nothing in selection, either natural or artificial—that the Creator made bees with certain instincts which can not be removed or changed. To such I have little to say, except that it does not appear that way to me.

If we are to get any great results from breeding we *must* decide what qualities we are to breed for. We must select one race of bees, and confine our efforts to that race alone. A first cross may sometimes be better than either race composing it; but such results are not permanent, and can be made so only by a long course of selection.

The leather-colored Italians are, I think, the best race to begin with. There are so many things to be considered in deciding among the different races that I can not give my reasons here; but after a fair trial I must give them the decided preference. They are good to begin with, but we want them better. We want them, 1. To store more honey; 2. To cap it whiter; 3. To swarm less; 4. To sting less; 5. We want to make them

more beautiful if we can. We will proceed to take up these points in the order of their relative importance.

1. *To store more honey.* A very simple matter if this quality were alone to be considered. Simply select the colony that produced the most pounds of honey, and breed queens from that alone. Select three or four of the best colonies for producing drones, and allow no other drones to fly.

2. *To cap whiter.* The Italians can be selected so they will cap as neatly as the blacks, if care is taken in selecting colonies for drones as well as queens.

3. *To swarm less.* Some say it can not be done, reasoning from a false analogy. They say it is like the breeding instinct—it can not be overcome; that it is a sign of energy, etc. So is stinging a sign of energy, and the gathering of large quantities of propolis. But in all three cases it is energy misapplied. We want bees that will turn their energies to our profit. In this case we are trying to get rid of an instinct. It is exactly similar to the sitting instinct in hens. We know that the sitting instinct can be almost entirely bred out of chickens, so we can produce bees that do not swarm, if we allow time enough. How long will it take? I don't know. Perhaps fifty years, perhaps a hundred. But we can produce bees at once that will swarm less than their ancestors did, simply by breeding from those that swarm the least.

4. *To sting less.* I think no one doubts that gentleness can be produced by selection. I have seen a strain of Italians so gentle that they could hardly be induced to sting, but they were very poor workers. The trouble was, they had been bred for gentleness and beauty, to the entire neglect of more important qualities. I would never raise queens from a very cross colony, no matter how much honey they stored; nor would I use poor workers to breed from, merely because they were gentle.

5. The constant temptation of the queen-breeder is to breed for beauty alone, because that is a quality that is at once apparent, while for other qualities it takes time to decide. But for the average bee-keeper, who keeps bees for profit, beauty must be pushed to the very end of the list of desirable qualities. So I think we had better confine our efforts in that direction to keeping three yellow bands. *The more qualities we breed for,*

the less we shall get of each particular quality; and it seems to me that beauty is the least important of all to the honey-producer.

To sum up the whole matter, I would first get a good strain of leather-colored Italians, then continually breed for the best, choosing one or two colonies that, all things considered, have given the largest net result with the least care and labor. Raise queens from the one or two best colonies only, but use several of the next best for raising drones.

BEE-KEEPING IN NEW ZEALAND.

A Honey-plant that is Supposed to be Poisonous for Cattle.

BY STEPHEN ANTHONY.

The engraving shows a great honey-plant in this locality. It is not exactly a tree, although our government calls it that, and includes it in the family of *Corneaceæ*. It grows in the bush or anywhere wild, on any kind of soil; has a profusion of creamy flow-

A NEW ZEALAND HONEY-PLANT BELONGING TO THE FAMILY OF CORNEACEÆ.

ers lasting pretty well through the season according to situation (gulleys first), and the bees are on it all the time. I think it gives an especially fine flavor to honey. It grows easily, but can be easily handled so as not to become a nuisance.

It is supposed to be poisonous to cattle (it certainly is narcotic), but this statement is modified in that it is so only when in bloom, and only when taken on an empty stomach. I have seen our cattle eat it many times, and as a rule I never stop them. None ever suffered from its effects. Cattle do not

each much of it; i. e., they do not make a meal of it, but take it only as if it were a tonic. If they were compelled to eat it altogether, or got into a habit of it, then of course there might be trouble.

Some one (usually a native) gets poisoned every year about here through eating bush honey (usually not capped), and puka-puka usually gets the blame. Mr. Hopkins had a look at a case of Maori honey-poisoning last year, and I think puka-puka got the blame; but the fact is significant, nevertheless, that it is the Maoris only, or principally they, that get poisoned, and in that case the honey eaten is never capped.

Wastete, New Zealand.

ALFALFA IN NEBRASKA.

**Conditions which Affect the Yield of Honey;
Irrigation; How the Shallow Hive
Outstrips the Eight frame
Dovetailed.**

BY D. R. WAGGONER.

My apiary is a small one, only 64 colonies, and is located eight miles north of the 40th parallel of latitude (south State line), and about 22 miles east of the 100th meridian, in Nebraska. We have about 24 inches yearly average rainfall, of which 17½ falls from April 1 to Oct. 1, during the growing season.

In a normal season our bees begin to raise brood rapidly, and build up when the fruit-bloom comes. This consists of wild plums, apples, cherries, peaches, apricots, etc. In June, when the first crop of alfalfa begins to blossom, we may expect swarms until this crop is cut, when swarming will stop. Cutting this crop begins very soon after the first blossoms appear, and lasts about three weeks. In July the bloom starts on the second crop of alfalfa where the first crop was cut earliest, other fields following in the order in which they were cut the first time. In a normal year we expect our main surplus of honey to be stored from the second crop of alfalfa. If there is plenty of rainfall during July and August, so that heartsease is abundant, we get a good yield in August, and until the frost comes, from this latter plant. These are our main sources of nectar, but of course we have others to help us along.

This year the fruit-trees were covered with blossoms, but the frosts killed them all so that our bees built up very little previous to June unless they were fed. They stored quite a lot of honey from the first crop of alfalfa, and things surely were on the boom with the second crop. Swarming did not begin until the second crop was in bloom. This year there was really no intermission between the blooming of the first two crops of alfalfa, for by the time the first crop was all cut the second was beginning to bloom where it was cut earliest the first time. At this writing (Aug. 12) bloom is coming on the third crop just as the last of the second has been stacked.

Within 1½ miles of my apiary there are 350 acres of alfalfa grown without irrigation. Thus it will be evident that this plant is the main source of our honey crop. This year especially it will be about the only source.

The yield of nectar from alfalfa varies much in different years in this vicinity where there is no irrigation. In order to secure a good crop of alfalfa honey it is necessary to have a vigorous growth of the plant, plenty of bloom, and a bountiful supply of nectar in the bloom. If there is a reasonable amount of moisture in the ground by May 1 to start a good growth of the plant for the first crop, and a good rain comes just after each hay crop is cut, a strong growth and plenty of bloom is assured. If moisture is lacking very much at these times the growth will be short and the bloom scanty. If a great excess of rainfall comes when alfalfa is just fairly in bloom there will be a deficiency of nectar in the bloom. For instance, in June, 1906, we had here 12.73 inches of rainfall; and in July, 9.26 inches. This was excessive during the months of bloom for first and second crops of alfalfa, and my bees made me only 6 pounds of surplus that summer per hive, spring count, owing to the lack of nectar in the bloom. In regions where irrigation is the rule the amount of moisture supplied to the plant can be regulated so as to secure a more uniform yield of honey from alfalfa.

SECTIONAL HIVES SUPERIOR TO FULL-DEPTH LANGSTROTH, AND WHY.

When I began bee-keeping I was green at the business, and hardly knew what kind of hive to use as the best and most convenient. I happened to choose a sectional hive for my own colonies, and I must say that I have never regretted my choice. The bees I took on shares were in regular eight-frame Dovetailed hives. The sectional hive I use is very simple in construction. Each of the two brood-chambers is 17 inches long, inside measure, eight-frame width, and 5½ inches deep, containing eight shallow Hoffman frames. I gave my neighbor's bees in the Dovetailed hives with deep frames just the same care I did my own; and in the two years, while I had the two kinds of hives in my yard I was surprised to see how much better the bees would winter in the divisible hive than in the deep-frame hive. I am thoroughly convinced that, where the bees in the cluster can have access to winter stores by means of the bee-space between the two sets of frames without being compelled to leave the cluster and travel over the top, under the bottom, or around the ends of the large frames to get feed, they will and do winter better, and come out stronger colonies in the spring. Nobody in this region winters bees in the cellar.

I run entirely for comb honey. Mysupers are 4½ inches deep. I use plain 4½×4½ sections with fences. Since the supers are only 17 inches long in the clear, the sections rest on plain slats ½ in. thick instead of in section-holders with end blocks between the sections and the ends of the hives. For the life

of me I can not see why any one should prefer a section-holder to a simple slat. I am not bothered any to speak of by slats sagging. If they should show any signs of doing so I just turn them the other side up for a few times.

SPRING MANAGEMENT.

In the spring or early summer, just before the alfalfa comes into bloom, I set a clean bottom-board beside one of my hives, separate the two sections of the brood-chamber, put the top one on the new bottom-board, lift off the cover, and put it on the section of the brood-chamber yet on the old bottom-board; then I set this section on top of that which I had placed on the clean bottom-board; lift up the old bottom-board and clean it well, and, lastly, set the hive just where it stood before. This shift I make through the entire apiary, as it disarranges the brood and leaves a space free of brood in the center of the hive with brood both above and below it. The queen will hustle to fill up the gap with brood, and by the time the honey-flow comes the bees go to storing in the super more readily, make stronger colonies to work during the flow; and, if we give them room enough in supers to store surplus they will, I believe, yield a better income to the bee-keeper. I consider the ease of making this spring interchange of the brood-chambers a great advantage of the divisible hive, to say nothing of the gain of having the combs in the frames built solid to the bottom-bars as a result of the change or the well-known advantages of handling hives rather than frames in working among the bees.

HIVE-STANDS.

I have my hives set on stands 7 feet long, each stand accommodating four hives. The following is a diagram of one of these stands:

WAGGONER'S HIVE-SHED.

The hives are set in two pairs with a space between each of the pairs the width of a hive. This is convenient when making the spring interchange of brood-chambers above mentioned. The 2×4-inch sills on which the hives rest are 1½ and 2 inches from the ground, the rear sill being the highest. The roofs of the stands are made of light ½-inch boards, and are high enough above the hives to allow of necessary tiering up and easy handling of supers.

As a convenience in hiving swarms which

cluster 8 to 10 feet above the ground I use a ladder, a diagram of which is shown on next page.

This ladder can be set under the cluster with the legs spread to suit, the hive set on the platform at the top of the ladder, the bees shaken down on the hive with cover off; and when the bees are almost all in, or when one wishes to carry the hive to its permanent stand, he can spread the legs of the ladder so as to lower the platform and allow him to lift the hive off easily. The platform remains level, no matter how much the legs are spread. The ladder can be folded up just like an ordinary step-ladder. The legs are sawed out of 2×6-inch stuff, 3½ inches wide at one end and 2½ at the other. A season's use of this ladder has proved it to be a great convenience.

PREVENTING PARTLY FILLED SECTIONS.

Toward the close of the honey-flow, in order to have as few partly filled sections as possible I use dummy boxes as long as the super is inside, and as wide as the super is deep. These boxes are made as deep as the width of one or two rows of sections, including separators. I place one of these, either the one or two row size, on each side of the super with the open part of the box close against the side of the super, and put the partly filled sections, if I have any, over the center of the hive where they will have the best chance of being finished up and capped over. I described these in GLEANINGS some months ago.

AN IMPROVEMENT IN BEE-ESCAPE BOARDS.

When I take off honey I use the Porter escape with two very narrow strips tacked on the upper surface of the board, one end of each strip being at the edge of the hole in the escape and the other at the rim on the side of the board. The little strips guide the bees to the escape, and the super is cleared of bees in about two-thirds the time it would be without them.

Some time ago I mentioned this in GLEANINGS, and Dr. Miller in his notes said it would be better to have four strips leading, one from each corner of the rim to the hole in the escape. With all respect to the opinions of an expert like Dr. Miller I will tell why I prefer my way. First, the more ends of little sticks you have around the hole, even though they be narrow, the less room there is for the bees to get down into the hole. A steady stream of bees going to the hole, and plenty of room to get down into the hole, is what we want. We want to avoid a jam of bees at the hole the same as we would a jam of schoolchildren at the head of a stairway in case of an alarm of fire. Second, just notice bees follow around the rim where the strips reach from the four corners of the escape-board to the hole. When they come to the acute angle made by the rim and the little strip they will back out, turn around, and go back the way they came, instead of going to the hole in

the escape; whereas if the angle is a right angle they will be more likely to turn the square corner and follow the strip to the hole.

If you don't believe this, just fix a strip at an acute angle and one at a right angle against the side of a window-light or screen where bees are trying to get out, and watch their movements. Third, the distance in an

15 $\frac{1}{2}$ long, and 11 $\frac{1}{2}$ wide, all outside measure, being one inch deeper, 1 $\frac{1}{2}$ shorter, and $\frac{3}{4}$ narrower than the inside measure of the super. Next I tap sharply with a hammer or mallet on the corners of the super-shell until it is loose, and then shove it down on the table, leaving the entire contents of the super resting on the box up above the super-shell, where I can pick off the separators and sections with the greatest ease. It is

much easier to pick sections off from simple slats than out of section-holders. Try this scheme of emptying supers for the sake of convenience and good temper.

I market my honey cased in the neatest style, within 30 miles of home. One large town of 4000 inhabitants, situated on the high divide, where alfalfa does not succeed as a crop, takes a large share of my surplus. I have little show-cases made with molded top and base, stained a walnut color, and varnished, which hold either six sections in two tiers or four sections in one tier, displayed through three-inch glass. These filled with honey are to stand on a counter or on top of a large showcase in a store to attract customers, and let them know that the merchant has choice honey in cases back on the shelves to sell. The little show-cases cost 25 cents each, and help the merchant and myself to make sales.

THE BEE-KEEPERS WHO HAVE FAILED.

I am no professional bee-keeper, only an amateur. There have been many of my neighbors who have started keeping bees here in the last ten years, and are now out (or as good as out) of the business. I wish to impress on those who think that about all a bee-keeper has to do in a year is to hive swarms and put on and take off supers, while the bees will take care of themselves and do all the rest, that they will be disappointed if they attempt to do business on that basis. I know of no employment which requires a man to be a natural mechanic, to be resourceful, to take advantage of little things to prevent even small losses, to be everlastingly watching the little things and doing the right thing at the right time, more than bee-keeping, if one expects to realize a fair profit. I have stayed with it, and have found a reasonable profit and much pleasure in running a small apiary.

Stamford, Neb.

[Unless the apiary were in an orchard of small trees so that all swarms would be rather near the ground, we should think an ordinary covered basket or swarm-catcher on the end of a pole would be handier. The pole could be propped up to bring the basket at any height; and when the bees are clustered they can be taken to the hive.—ED.]

A CONVENIENT STEP LADDER TO BE USED AT SWARMING TIME.

ordinary eight-frame Dovetailed hive from the center of the rim at the end of the board around to the center of the rim at the side, and thence to the hole in the escape, is 20 $\frac{3}{4}$ inches. The distance from the center of the rim at the side to the corner and thence direct to the hole is 19 $\frac{1}{2}$ inches. These are the longest distances bees would have to travel in following the rim and strips as guides in the two plans of arranging the strips in order to reach the hole. So the only gain in distance of travel by Dr. Miller's plan would be at best 1 $\frac{1}{2}$ inches—not enough to compensate for the other disadvantages.

HOW TO GET THE FILLED SECTIONS OUT OF A SUPER.

When I wish to empty a super full of honey I first, if necessary, run a sharp thin case-knife blade around between the sections (or section-holders if one uses them) and the super-shell. Then I take out the wedges or springs. I next set the super on a box turned bottom side up and placed on the work-bench or a table. The box is 5 $\frac{1}{2}$ inches deep,

ARE BEES REFLEX MACHINES?

Experimental Contribution to the Natural History of the Honey-bee by
H. v. Buttel-Reepen, Ph. D. Translated by Mary H. Geisler.

Continued from Feb. 15th issue.

THE MEANS OF COMMUNICATION IN BEES.

According to Bethe, there is not "the slightest doubt" that bees recognize each other or hive strangers only by odor (chemical substance), and that no special means, neither a "sound" nor a "definite movement of the antennæ," comes into question as possibilities for communication.⁴²

Long-continued and careful observations, however, yield many data which do not coincide with this view.

INVESTIGATIONS WITH COLONIES FROM WHICH THE QUEENS ARE TAKEN.

If the queen is taken from a very strong colony of 50,000 to 60,000 bees or more, the loss is first noticed sometimes after an hour, sometimes after many hours. This is particularly the case if the removal is made during a rich honey-flow when the bees are busily occupied with bringing in and storing the nectar. A striking change then suddenly takes place; the comfortable humming gives way to a louder, long-drawn-out, lamenting buzz.⁴³ The guards at the entrance and those providing the ventilation become uneasy; excited bees come out of the hive and run over it as if seeking something; single bees fly away quickly, then back; the whole character of the colony is changed, not only in outward behavior but also in inner disposition. They are very irritable, and inclined to sting. I have sometimes noticed the queenlessness of colonies, which usually were very gentle, by the increased desire to sting. Such notice is, of course, possible only to one who is used to working without veil or gloves.

If the door⁴⁴ of a queenless colony is opened, the same agitation is seen in the interior, and smoke blown in only increases the buzzing. This excitement over the loss of a queen often appears very soon after her removal, particularly when there is no forage or if the colony is weak.

The difficult question now arises, how bees notice the absence of the queen and how they communicate this loss. Is it the sudden absence of her odor? Hardly, at least not in all cases, for we have seen in a previous paragraph that the odor of the queen is exceedingly adherent, and therefore the walls, as well as the bees, must be impregnated with it. But the intensity is gradually becoming less. However, this odor is variable in the customary course of events,⁴⁵ and so no uneasiness of any kind arises on this account. Furthermore, how does it happen that the bees *suddenly* become agitated after the queen has been taken out sometimes for an hour or more?

If Bethe is right, that the means of communication depend upon the outflow of some chemical, then the above observations would prove at least that the odor of the queen is a very dominant one in the colony. The queen then does not, as Bethe declares, take on the hive substance, but just the opposite happens; the queen influences the hive odor

⁴² Bethe, l. c., p. 70.

⁴³ That "agitated bees" constantly "buzz" is a misleading expression of Bethe's. Particularly can the humming with raised abdomens and fanning wings upon the flight-board be sharply distinguished by the trained ear from what is usually called the "buzzing" of bees, by the pitch.

⁴⁴ Reference is here made to the German style of hive with a door in the rear. The American style of hive opening at the top is little used in that country.—E. F. P.

⁴⁵ If the queen gets into the honey-chamber, which is generally separated from the brood-chamber beneath by a strong piece of board with slits in for the passage of workers, and if she there continues to lay eggs, it is clear that her odor must soon be lost to the bees beneath. This is especially true if there is an entrance into the honey-chamber. Under these circumstances, however, excitement at the queen's absence never breaks out; at most the "isolated" bees after a few days occasionally build queen-cells, but more often not.

considerably, or at least a mutual scenting takes place. On the other hand, if we agree with Bethe in his statement that the queen takes up the hive substance of the colony, the means of communication must depend, not upon reflexes of smell alone, because the colony odor would not be influenced by the removal of the queen.

If we were to ask bee-keepers their opinion in this matter, they would probably answer that the young bees which care for the feeding of the brood and the queen, "miss" the latter after a longer or shorter period, and begin to seek her diligently, communicating their anxiety to the whole colony until the "conviction" that the queen is gone comes into consciousness, when the comfortable humming changes to a loud buzz.

But since the young bees, as all bee-keepers know, can be taken away very well with the queen it naturally follows that they take no very important part in this matter. Then the old bees will begin the loud buzzing.

One can, however, ingeniously gather a colony of old workers and place within it a queen enclosed in a cage. The excited colony is quieted as if by magic. The hostile bees next to the cage begin to lift their abdomens, fanning their wings,⁴⁶ with a characteristic humming. This hum is taken up by other bees, and suddenly there is peaceful quiet.

Before we formulate conclusions from the foregoing let me communicate further observations.

The following experience is interesting, and proves that the feeding of the queen as one of the chief phenomena of life needs not to be taken into consideration in the breaking-out of the agitation over the loss of a queen, apart from the odor.

In bringing in a first swarm, I crushed the queen by accident. Since I could not care for it on that day nor the next, and I did not have another queen at my disposal to substitute, I knew that the swarm would certainly fly out again and join the mother colony. To prevent this, I arranged the following experiment: I fastened the dead queen with a needle to a piece of cork and hung it in the cluster of bees. The colony remained quiet, and I knew later on that it had felt entirely queen-right because the comb which it made showed no drone-cells, and the dead queen was surrounded by licking bees.⁴⁷ How long a dead queen can supply the place of a living one I am not able to tell.

However, even a dead queen may be dispensed with. In order to do this, I put a weak colony into swarming condition—that is, took away all combs so that the agitation could be more quickly observed. The queen was put into a cage. The next day I took the cage out of the colony, and very soon I noticed the typical signs of queenlessness. When the excitement seemed to have reached its height I opened the glass door and held the cage, from which the queen had been quickly taken, in the midst of the bees. Immediately it was surrounded by many "joyful" bees with lifted abdomens, fanning with their wings, and the buzzing ceased. Here we have conclusive proof that the odor of the queen is enough to satisfy all the instincts which appear unsatisfied during the excitement over the absence of the queen.

The conclusion may easily be drawn that, if the weak odor adhering to the queen-cage causes a cessation of the agitation, and certainly it is the odor alone, the disappearance or weakening of the same causes the outbreak of the uneasiness. But this deduction does not seem conclusive to me; for, as I have said above, the odor does not disappear with the removal of the queen, but is, however, weakened; and if the colony is vigorous, and their instincts are diverted by a rich honey-flow, the bees notice the loss only after some time has passed. But in the case of the sudden outbreak of uneasiness over the absence of a queen, we have to do with an intensified instinct, for which the shadowy memories in actual requirement are sufficient for the needs of the case, if I may so

⁴⁶ In the original, the author characterizes this peculiar humming as "sterzeln." This he describes in a footnote as follows:

"By 'sterzeln' is meant that characteristic raising of the abdomen, accompanied by a slow whirring of the wings, which indicates joy. Therefore it is seen in the above case, or when they discover the hive after going astray, but never on finding a honey supply, even if very hungry. This is similar to what I might call the attitude of fright. If the finger is approached to the entrance of a hive, single bees guarding the passage are seen to hasten toward the hostile object, raising their abdomens in threatening manner, and they remain in this position."

⁴⁷ A queenless colony will erect drone-cells if it builds at all.

express it. Thus bees in the spring, impelled by necessity in a region where there is little pollen, will gather the dust from thrashing, coal dust, or brick dust, instead of the lacking pollen. Once I observed bees collecting even sawdust. It is just as little permissible to draw from this the conclusion that brick dust is equivalent to pollen, because bees react in the same way toward both, as it is to conclude that it is the missing odor alone which causes agitation in a stock, because the bees are satisfied with the remembered odor in place of the real queen. We shall have better proof further on.

BEHAVIOR OF A QUEENLESS SWARM.

As a first swarm was issuing I caught the queen at the entrance of the hive. Now instead, as happens in most cases, of the swarm returning to the hive after the vainly searching circling, the bees hung to a branch united in the well-known cluster. Since no alarm was shown, I took it for granted that a second queen had swarmed with them; but a prompt examination of the hive revealed no queen-cells from which a young queen could have emerged. The swarm was perfectly quiet for over half an hour, then suddenly broke up and went back to the hive—a certain proof that it was queenless. In this case, then, there was a considerable time between the removal of the queen and the breaking-out of the uneasiness over her absence. It was evidently not the disappearance of the odor of the queen that caused the discontent, for the odor was lacking from the beginning. Queenless swarms rarely take place; and if they do, they do not settle and disband again: they miss the queen immediately. Coming out into the open air, the odor of the queen seems to be of little value. This is evident from the fact that if one keeps a caged queen in a circling swarm, it has to remain there for a long time before she is scented by the bees, if she becomes scented at all. But if a bee once places itself upon the cage, "joyously" lifting the abdomen, and humming, then it is not long before the rest are attracted by the sound of the "satisfied" hum. I might, incidentally, mention that there is a so-called "diamond rule" among bee-keepers. This rule is that the queen is to be enclosed in a cage for a short time before and during a rich honey-flow in order to hinder her from laying eggs. The bees then will have little brood to care for; the consumption will be diminished, and the honey store should increase. This, however, frequently does not take place, because the normal condition of the colony is disturbed. The colony often believes itself queenless and builds queen-cells in spite of the imprisoned queen in the middle of the colony; but this phenomenon does not appear in all colonies.* Apparently there is here, as has been demonstrated before, an unsatisfied feeding instinct. The nurses can not distribute the richly prepared larval food, and so the impulse is generated to remove the abnormal condition by building queen-cells. I can imagine this as an example of a clear reflex. There is no need whatever for "reasoning" of any kind.

I shall now return to the very vigorous colony mentioned before. If the queen is taken away from such a colony, which compactly filled the brood-chamber and honey-chamber in a large hive, the signs of uneasiness over the absence of the queen will go on as described. When the colony is in greatest excitement, a cage containing a queen may be pushed into the honey-chamber in the upper part of the hive which opens from behind, and then the condition of the bees at the entrance at the opposite end of the hive underneath in the brood-chamber may be observed. Almost at once a change in the behavior of the uneasy bees is apparent; the buzzing dies out in the hive, and the bees, searching around at the entrance, enter with lifted abdomens and fanning wings.

The explanation can here certainly not be the influence of odor, since the odor of the queen could not penetrate in an instant to the entrance which is separated from the honey-chamber by the whole of the brood-chamber. If the extraordinary penetrating odor of female insects be cited, as, for example, that of the moths (sphinx, etc.), then I would reply by referring to the disregard of an imprisoned queen in a swarm.

* It is curious that queen-cells are also established if the queen is decrepit. If, therefore, queen-cells are found, and at such a time either strongly defective brood or drone brood in worker-cells (on account of and at such a time either strongly defective brood or drone brood in worker-cells (on account of the exhaustion of the supply of sperm-cells), then one can be sure that the old queen will shortly disappear from the hive. Perhaps the same instinct is active here as in the case of an imprisoned queen (see footnote, p. 11).

DISREGARD OF A QUEEN IN OPEN AIR.

In order to demonstrate this question still further I hung a cage containing a queen on a stick and stuck this into the ground so that the cage was at the same height as the hive entrance, about thirty-five centimeters to one side of the flight-board. None of the numerous bees flying in and out scented the queen, which remained entirely unnoticed while the colony continued agitated.

HEARING CAPACITY AND SENSATIONS OF SOUND.

If we now conclude from the foregoing observations in what way the discontent because of the absence of the queen, as well as the content because of her presence, is communicated, and what the means of communication are, we must conclude that the odor is not the only factor. We have been able, on the one hand, to determine with reasonable certainty that, if the odor were sufficient to inform the colony of the presence or absence of the queen, no other special kind of communication need be used; on the other hand, we saw indications of discontent (for example, the building of queen-cells) among bees when a queen was present in a cage. So we see signs of peace or agitation in cases where the influence of odor seems completely excluded. In all observations, when the colony notices the absence of the queen there is always a change in the usual characteristic sound in the hive, the bustle of the colony, if I may so express it.

There is, therefore, not the slightest doubt in my mind that bees communicate with each other by sound. The tone of "peace" attracts hive mates or quiets them; the louder buzzing excites them: it disappears if the queen is given back. At the same time the whole character of the colony changes,⁴⁹ the queenless irritable bees become quiet and peaceful, and again take up their work, which was laid aside during the excitement. We must admit the possibility of communication between bees by sound, therefore of hearing capacity and sound sensations.⁵⁰ Each bee has the instinct to join in the tone of discontent if it hears it; therefore if the absence of the queen is noticed by one bee the agitation is very quickly propagated throughout the colony.

How the first notice of the lack of a queen takes place is naturally, as before stated, very difficult to determine—perhaps there are several possibilities. Often the absence of the queen odor may bring about the result; it may be the absence of the characteristic humming described, which the bees occupied with the queen produce. Further, it is possible that the queen herself makes sounds, the absence of which is noticed. I have never heard such a humming, but it is not impossible that such tones, not perceptible to the human ear, exist.

EXPERIMENTS ON SWARMS.

The following observations will show to what a great extent the means of communication between bees depend upon sound perceptions. The loud buzzing of swarms is readily distinguished from the usual hum by anybody who has been occupied with bees for any length of time. The swarm presses out from the hive in impetuous haste in the peculiar swarm dance; it surges and whirls in "bacchanal delight," as if the bees were really drunk with "joy." The "swarm dizziness," as bee-keepers say, has seized it. In this dizziness it forgets everything connected with the old dwelling, and bees even forget to sting.

"Swarming bees do not sting" is an old bee-keepers' saying. From this we get the old fable that bees recognize the bee-master, because, generally, outsiders approach a bee-hive only to see the interesting spectacle of a swarm, and then notice the bee-keeper.

⁴⁹ Careful observation will show that every colony has its particular character, which is determined in part by the strength of the colony. On the other hand, we often see what are apparently great differences in colonies of like strength. One colony is gentle; another constantly desires to sting. One defends its hive entrance carefully; another almost not at all, although it is a strong colony. One flies constantly earlier than its neighbor, etc. Lubbock and Herman Müller have shown that individual bees vary also. (Herm Müller, "Versuche über Farbenliebhabelei der Honigbiene," Kosmos, Jahrg. 6; Lubbock, "Ants, Bees, and Wasps," German translation published in Leipzig, 1883, English edition in the International Scientific Series, New York, 1883.)

⁵⁰ In the attraction of a queenless colony into the hive of a queen-right one, then, perhaps in the first place the hearing capacity comes into question (see p. 5), the sound of the contented humming acts as a powerful stimulus and causes the migration.

often quite unprotected, quiet and composed, stand in the middle of the tumult without being stung.

The "Deutsche Bienenfreund," 1894, reports the following: "A boy about ten years old was standing near a hive, bare-headed and shirtsleeved, when a swarm issued. After flying here and there, the queen alighted on the boy's head, and thousands of bees quickly followed. The boy's father, recognizing immediately the state of affairs, called to him hastily (he had often looked on during the catching of a swarm), 'Do not move, Hans. Shut your mouth and eyes, and breathe through your nose. I will sprinkle and capture them!' The boy obeyed, the father poured water over his head, bent it forward, and with a feather stroked the whole swarm into a basket underneath. The boy had not a single sting."

After my own experiences, I consider this tale entirely trustworthy.

In 1893, "Studers ill. Schweizer. Bienenfreund" showed the picture of a young bee-keeper who had been photographed with a swarm which hung down from his hand. In the issue of the swarm he caught the queen with his fingers, thus causing the swarm to surround his hand. When the photograph was completed, three-quarters of an hour had elapsed, which was endured very quietly, the arm being supported with a stick. Head and hands were not stung. Similar pictures have been published in "Gleanings in Bee Culture" during the last few years.

It is not in contradiction to the above to say that most disasters are caused by swarming bees, for nervous blows or accidental crushing irritates the swarming bees; and first one sting, then hundreds follow, excited by the strong odor of the poison.

Shortly before the issuing of the swarm, single bees are seen coming out with uneasy motion; they press through the bees around the entrance, which often cling closely together like a long "beard" hanging from the flight-board. It can hardly be doubted that sounds of some kind perhaps serve here for communication—sounds lost to the human ear in the general hum;⁵¹ at least there is no more plausible explanation for the peculiar result, for suddenly the "beard" loosens, the bees enter the hive quickly, assail the honey stores, and fill their honey-sacs. All the others desiring to swarm do the same thing, and suddenly the swarm breaks forth. Those just returning from the fields heavily laden with pollen are involved in the tumult, infected with the sound of swarming, and fly with the swarm.

THE INFECTING INFLUENCE OF THE SWARM TONE.

That the sound made in swarming, which is given only in flight, is infectious is well known; for now and then it happens that the neighboring colony, though not nearly ready to swarm, will follow the swarm-tone and swing into the air. If two swarms issue at the same time, they mutually attract each other and unite.

That we have here to do with a chemical reflex, as is thought by Bethe, who, strangely enough, does not take swarming into consideration, seems improbable to me. If the rich possibilities for sound communication between bees are borne in mind, it is evident that this capacity must have some object, and that it is not practicable to ignore these data.

THE ENTICING NOTE OF BEES.

If a swarm is shaken out on a sheet spread over the grass, and a hive never before used is placed, for instance, on the north side of the sheet, it will remain unnoticed if it has not come in direct contact with the swarm. But if a handful is scooped up and thrown at the entrance, they will immediately draw near with specially loud humming, part standing outside, however, on the flight-board with lifted abdomens and wings fanning. All the other bees near by turn, if they have been facing away from the hive, and follow the alluring sound, lifting their abdomens and fanning with their wings. More keep following, and a broad band march into the dwelling. If now the hive is taken away and placed on the south side, the bees quickly march on further north, but for only a short time. Then the increase of the attracting note from the south causes a gradual turning

⁵¹ Movements of the antennæ should certainly be considered, since the play of the antennæ is always lively, and often a mutual touching takes place.

of the stream, which enters the hive little by little. It may happen that a little cluster of bees advances firmly northward, although many mates turn toward the south. The alluring tone does not seem to penetrate further; they heard it coming from the north and follow the memory. There seems to be no other explanation for this course. In my opinion the fact that not only a single bee but plenty of them, a small cluster, follows this memory is a proof of the impulse for imitation which is undoubtedly present in bees for it is not likely that every bee in the small cluster has this memory but perhaps only a few of them. The others follow only on account of this impulse for imitation. If the first bees remain true to the direction, then a great number will turn quickly with them.

It must really seem strange, to any one familiar with the natural history of the bee, that there can be any doubt as to the possibility of communication through sound, when the whole life of a bee is one continuous humming, if I may so express it. Can this "audible speaking" have no purpose? Only the dead bee is quiet.⁶⁴

If the previous assertions are not convincing, we may find proof of their capacity for hearing in the following:

THE "TEETING" AND "QUAHKING" OF THE QUEEN.⁶⁵

When the first swarm has issued with the old queen, normally nine or ten days pass before the after-swarm follows. One or two days before the swarming, a strange concert may be heard in the hive on a quiet evening at a distance of a couple of steps. It is the "teeting" and "quahking" of the young queen. As is well known, the old queen, before her exit, lays eggs in the queen-cells at intervals every day or so; the consequence is, that the young queens do not all emerge at once.

The first queen to emerge falls upon the other queen-cells in order to kill her rivals. If the colony wishes to swarm, however, the workers prevent this destruction, and the queen begins to "teet" in "jealousy." She presses her head against the comb, as I have observed, and sounds a clear, ringing, long-continued "teet, teet," apparently using the stigmata on the thorax. Immediately the most mature of the queens still in the cells answers with a short deep "quahk, quahk." Thus this interchanging goes on for hours or days with shorter or longer interruptions. If rainy weather prevents the issuing of the swarm, and more queens mature, they "quahk" likewise. They "dare" not emerge as long as the "teeting" goes on; and since they need nourishment they cut a little slit with their mandibles, through which they stick their probosces, and so are fed by the workers.

It would lead me too far to go further into these interesting circumstances.

If we can prove from the above an undoubted capacity for hearing, we can also from the following experiment:

THE QUEEN'S TONE OF FEAR.

If a strange queen is put into a queenless colony by merely allowing her to run in upon a comb, then the bees nearest her fall upon her and bite her legs or ride upon her to sting her. The powerful queen runs quickly away from her persecutors, but she is continually seized by others. Now in her "fear" she utters loud cries which throw the whole colony into excitement. One could here conjecture the influence of odor; but a strange queen in a cage does not cause such excitement, especially not if the colony is queenless. It is doubtless the tones of fear which stir up the whole colony. We have here again an unmistakable reaction toward sound-sensations.

The attempt might be made to weaken these assertions, so far as they apply to the existence of hearing capacity, by pointing out that no one has yet succeeded in showing in insects a reaction toward sounds artificially produced. Then I would call to notice that recently an American has obtained undoubted reactions toward the notes of tuning-forks in two members of the Formicidæ⁶⁶ (*Lasius Americanus* and *Formica nitidiventris*)

⁶⁴ 1. Ernst Haeckel, Die Welträtsel, Bonn, 1899, p. 145.

⁶⁵ 2. Now and then the colonies settle down in their winter sleep into a condition of complete quiet, but usually it is accompanied by a hardly audible murmur.

⁶⁶ It is, of course, very difficult to represent these sounds in words; but the ones here given are often used in English to represent them. No bee-keeper will have any difficulty in knowing what is meant. The author represents them in German by the words "Tüten" and "Quaken."—E. F. P.

⁶⁶ Science (The Sense of Hearing in Ants), No. 5, Vol. X., No. 256, 1899. See also my Conclusion

and in two Myrmicidæ (*Crematogaster lineolata*, and a kind of *Aphœnogaster*). The well-known myrmecologist William Morton Wheeler has meanwhile published in an important paper (Ethological Observations on an American Ant, *Journal für Psychologie und Neurologie*, Bd. II., Heft 1 u. 2, Berlin, 1903), his investigations on hearing in ants. He writes as follows:

"Stridulation, at least among the Myrmicinae, Ponerinae, and Dorylinae, is an important means of communication, which Bethe has completely ignored, and even Forel and other myrmecologists have failed to appreciate. It readily explains the rapid congregation of ants (Myrmicinae) on any particle of food which one of their number may have found, for the excitement of finding food almost invariably causes an ant to stridulate and thus attract other ants in the vicinity. It also explains the rapid spread of a desire to defend the colony when the nest is disturbed. This is especially noticeable in species of *Pheidole*, *Myrmica*, and *Pogonomyrmex*. It is the secret of being able in a short time to catch ants like *Pogonomyrmex molefasciatus* in great numbers by simply burying a wide-mouthed bottle up to its neck in the mound of the nest. An ant approaches and falls into the bottle. It endeavors to get out, and, failing, begins to stridulate. This at once attracts other ants which hurry over the rim and forthwith swell the stridulatory chorus till it is audible even to the human ear. More ants are attracted, and soon the bottle is filled. If it be corked and shaken for the purpose of still further exciting its contents, and then held over another *Pogonomyrmex* colony whose members are peacefully sauntering about on the dome of their nest, the wildest excitement will suddenly prevail, as if there had been a call to arms or—to dinner. Even more remarkable is the stridulation in a colony of *Atta fervens*, the Texan leaf-cutting ant. Here the different ants, from the huge females through the males, large soldiers and diminishing casts of workers to the tiny minims, present a sliding scale of audibility. The rasping stridulation of the queen can be heard when the insect is held a foot or more from the ear; to be audible the male and soldier must be held somewhat closer, the largest workers still closer; whereas the smaller workers and minims, though stridulating, as may be seen from the movements of the gaster on the postpetiole, are quite inaudible to the human ear. It is not at all improbable that all this differentiation in pitch, correlated as it is with a differentiation in the size and functions of the various members of the colony, is a very important factor in the coöperation of these insects, and of ants in general. The contact-odor sense, important as it undoubtedly is, must obviously have its limitations in the dark subterranean cavities in which the ants spend so much of their time, especially when the nests are very extensive like those of *Atta*. Under such conditions stridulation and hearing must be of great service in maintaining the integrity of the colony and its excavations. The fact that as yet no unquestionable auditory organs have been discovered in ants is of secondary importance when it can be so easily shown that these insects really respond in an adaptive manner to the sounds produced by other members of the colony."

I know very well that Miss Adele M. Fielde and George H. Parker are of the opinion (*The Reactions of Ants to Material Vibrations*, Proc. Acad. Nat. Sc., Philadelphia, Sept., 1904) that "it is misleading to ascribe or deny hearing to ants; they are very sensitive to the vibrations of solids, not to those of air; their reactions could be as appropriately described as resulting from touch as from hearing." But the above investigations on bees have been neglected by these authors, and I am still of the opinion that a sensitiveness to the vibrations of air can not be denied so far as bees are concerned, and the above experiments of Wheeler seem to show the same in ants.

To be continued.

ARE BEES REFLEX MACHINES ?

SWARM CONTROL.

I operate a few hives for the love of it, and for comb honey. The honey surplus is from alfalfa and sweet clover. The season extends from the middle of June to the middle of October, being most important from July 1 up to and perhaps a little beyond Sept. 1.

What results might I look for from the following method?

1. Put full body hive over the old hive and brood-nest with excluder between. When the honey-flow is well started shake all bees into the upper part; set the old brood-nest to one side, and, by changing back and forth, incorporate its bees with those in the new body. I do not wish for increase. Would this method, practiced, say about June 20 to July 1, be likely to stave off any further swarming?

2. How would it work to proceed as above, except to put the old brood-nest, after shaking, on top of the new, and its superimposed section-frames, using a Porter bee-escape between the old brood-nest and the topmost section? Leave this on until the young bees had hatched and passed down to become a part of the colony below?

3. What results would likely come from the following method? Place the old queen with proper frames in the upper hive; place a queen-excluder between the two; stop the old entrance, and make a new one between the two hive bodies. Place over the queen-excluder a suitable, heavy, flat, close-fitting cloth, except a small section cut out at the rear of the cloth, $1\frac{1}{2}$ inches square, at which point the queen-excluder should permit of the bees freely passing to the upper body and to the exit from that body to the outside. Would the bees thus gradually abandon the lower hive, and become part of the colony working from the new entrance and storing in the sections, which have, of course, been superimposed? Would it work to use the Porter bee-escape between the lower and the upper body, and so slowly empty the lower body?

I have two box hives. Rather than transpose the bees to frame hives I thought of forming nuclei in a full-size frame hive, placing the hive between the two box hives, and, about the time they are threatening to swarm, leave the box hives and remove to another place, thus throwing the field force of both these queens to the nucleus.

I can repeat this, either in the same way or to bring strength in bees to where it may be most valuable—perhaps twice more before the flow is ended.

May not these queens so kept at work, and

utilizing all their field force, be made quite as effective in producing honey as if I transferred, and the breeding-space of the box hives, which it costs nothing to preserve, is absolutely lost?

There is a plan, originated, I believe, by a Mr. Dudley, of this State, by which, in a situation as described in 3 above, he uses a tin tube on the outside, up which the bees from the lower body pass to the entrance between the two hives, this being their only egress inside or out. Then bees do not find their way back, but at once take up work at the upper entrance, and in behalf of the upper colony. Why is this cumbrous method any better than the use of the Porter bee-escape placed inside, allowing the lower hive to empty slowly into the upper with no possible return? I should very much like to hear Dr. Miller's comments on these plans.

Could I introduce a new queen by using her in plan 3, placed on one or two frames of young bees from the lower brood-nest instead of the old queen, keeping the latter below until I have secured the most of the strength from that brood-nest and am ready to get rid of the old queen?
